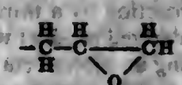
**PROCESS FOR BREAKING PETROLEUM EMULSIONS, CERTAIN OXYALKYLATED POLYEPOXIDE-TREATED, AMINE-MODIFIED THERMOPLASTIC PHENOL-ALDEHYDE RESINS AND METHOD OF MAKING SAME**

Melvin De Groote, University City, and Kwan-Ting Shen, Brentwood, Mo., assignors to Petrolite Corporation, Wilmington, Del., a corporation of Delaware



No Drawing. Application July 30, 1953, Serial No. 371,413

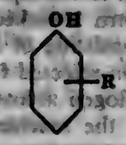
20 Claims. (Cl. 252—344)

1. A process for breaking petroleum emulsions of the water-in-oil type characterized by subjecting the emulsion to the action of a demulsifier, said demulsifier being obtained by a 3-step manufacturing method involving (1) condensation; (2) oxyalkylation with a polyepoxide; and (3) oxyalkylation with a monoepoxide; said first step being that of (A) condensing (*a*) an oxyalkylation-susceptible, fusible, non-oxygenated organic solvent-soluble, water-insoluble, low-stage phenol-aldehyde resin having an average molecular weight corresponding to at least 3 and not over 6 phenolic nuclei per resin molecule; said resin being difunctional only in regard to methylol-forming reactivity; said resin being derived by reaction between a difunctional monohydric phenol and an aldehyde having not over 8 carbon atoms and reactive toward said phenol; said resin being formed in the substantial absence of trifunctional phenols; said phenol being of the formula

in which R is an aliphatic hydrocarbon radical having at least 4 and not more than 24 carbon atoms and substituted in the 2,4,6 position; (*b*) a basic hydroxylated polyamine having at least one secondary amino group and having not over 32 carbon atoms in any radical attached to any amino nitrogen atom, and with the further proviso that the polyamine be free from any primary amino radical, any substituted imidazoline radical, and any substituted tetrahydropyrimidine radical; and (*c*) formaldehyde; said condensation reaction being conducted at a temperature sufficiently high to eliminate water and below the pyrolytic point of the reactants and resultants of reaction; and with the proviso that the resinous condensation product resulting from the process be heat stable and oxyalkylation-susceptible; followed as a second step by (B) reacting said resin condensate with nonaryl hydrophile polyepoxides characterized by the fact that the precursory polyhydric alcohol, in which an oxygen-linked hydrogen atom is replaced subsequently by the radical

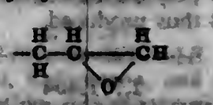
in the polyepoxide, is water-soluble, said polyepoxides being free from reactive functional groups other than epoxy and hydroxyl groups and characterized by the fact that the divalent linkage uniting the terminal oxirane rings is free from any radical having more than 4 uninterrupted carbon atoms in a single chain; with the further proviso that said reactive compounds (A) and (B) be members of the class consisting of non-thermosetting solvent-soluble liquids and low-melting solids; with the added proviso that the reaction product be a member of the class of acylation- and oxyalkylation-susceptible solvent-soluble liquids and low-melting solids; and said reaction between (A) and (B) being conducted below the pyrolytic point of the reactants and the resultants of reaction; and with the final proviso that the ratio of reactants be 2 moles of the resin condensate to 1 mole of the polyepoxide, and then completing the reaction by a third step of (C) reacting said polyepoxide-derived product with a monoepoxide; said monoepoxide being an alpha-beta alkylene oxide having not more than 4 carbon atoms and selected from the class consisting of ethylene oxide, propylene oxide, butylene oxide, glycide and methylglycide.

2,771,455



**PROCESS FOR BREAKING PETROLEUM EMULSIONS, CERTAIN OXYALKYLATED POLYEPOXIDE-TREATED, AMINE-MODIFIED THERMOPLASTIC PHENOL-ALDEHYDE RESINS AND METHOD OF MAKING SAME**

Melvin De Groote, University City, and Kwan-Ting Shen, Brentwood, Mo., assignors to Petrolite Corporation, Wilmington, Del., a corporation of Delaware



No Drawing. Application July 30, 1953, Serial No. 371,414

20 Claims. (Cl. 252—344)

1. A process for breaking petroleum emulsions of the water-in-oil type characterized by subjecting the emulsion to the action of a demulsifier, said demulsifier being obtained by a 3-step manufacturing method involving (1) condensation; (2) oxyalkylation with a polyepoxide; and (3) oxyalkylation with a monoepoxide; said first step being that of (A) condensing (*a*) an oxyalkylation-susceptible, fusible, nonoxygenated organic solvent-soluble, water-insoluble, low-stage phenol-aldehyde resin having an average molecular weight corresponding to at least 3 and not over 6 phenolic nuclei per resin molecule; said resin being difunctional only in regard to methylol-forming reactivity; said resin being derived by reaction between a difunctional monohydric phenol and an aldehyde having not over 8 carbon atoms and reactive toward said phenol; said resin being formed in the substantial absence of trifunctional phenols; said phenol being of the formula

in which R is an aliphatic hydrocarbon radical having at least 4 and not more than 24 carbon atoms and substituted in the 2,4,6 position; (*b*) cyclic amidines selected from the class consisting of substituted imidazolines and substituted tetrahydropyrimidines in which there is present at least one basic secondary amino radical and characterized by freedom from any primary amino radical; and (*c*) formaldehyde; said condensation reaction being conducted at a temperature sufficiently high to eliminate water and below the pyrolytic point of the reactants and resultants of reaction; and with the proviso that the resinous condensation product resulting from the process be heat stable and oxyalkylation-susceptible; followed as a second step by (B) reacting said resin condensate with nonaryl hydrophile polyepoxides characterized by the fact that the precursory polyhydric alcohol, in which an oxygen-linked hydrogen atom is replaced subsequently by the radical

in the polyepoxide, is water-soluble, said polyepoxides being free from reactive functional groups other than epoxy and hydroxyl groups and characterized by the fact that the divalent linkage uniting the terminal oxirane rings is free from any radical having more than 4 uninterrupted carbon atoms in a single chain; with the further proviso that said reactive compounds (A) and (B) be members of the class consisting of non-thermosetting solvent-soluble liquids and low-melting solids; with the added proviso that the reaction product be a member of the class of acylation- and oxyalkylation-susceptible solvent-soluble liquids and low-melting solids; and said reaction between (A) and (B) being conducted below the pyrolytic point of the reactants and the resultants of reaction; and with the final proviso that the ratio of reactants be 2 moles of the resin condensate to 1 mole of the polyepoxide, and then completing the reaction by a third step of (C) reacting said polyepoxide-derived product with a monoepoxide; said monoepoxide being an alpha-beta alkylene oxide having not more than 4 carbon atoms and selected from the class consisting of ethylene oxide, propylene oxide, butylene oxide, glycide and methylglycide.

2,771,456

**FINISHING COMPOSITIONS COMPRISING AQUEOUS DISPERSIONS OF BUTADIENE-ACRYLONITRILE COPOLYMER AND POLYVINYL ALCOHOL**

Moses Kronberg, Roslyn Heights, and Frank Campo-Cassidine, Pelham, N. Y., assignors, by mesne assignments, to Jane, Wichita, Kans., a partnership

No Drawing. Application July 3, 1952, Serial No. 297,181

3 Claims. (Cl. 260—29.6)

1. A surface coating, impregnating and finishing composition consisting of a stable mixture of at least 15% of an aqueous dispersion which contains about 45% solids and in which the butadiene and acrylonitrile are co-polymerized in the proportion of 85 to 50% butadiene and 15 to 50% acrylonitrile, in mixture with not more than 75 parts of an aqueous solution containing 75% polyvinyl alcohol.

---

2,771,457

**PRODUCTION OF VINYL CHLORIDE POLYMERS**

Arthur William Barnes, Tewin, Bernard Stephen Dyer, Tewin Wood, Welwyn, and Austin Atkinson Gibson, Cleveleys, England, assignors to Imperial Chemical Industries Limited, a corporation of Great Britain

No Drawing. Application May 14, 1951, Serial No. 226,298

Claims priority, application Great Britain June 15, 1950

7 Claims. (Cl. 260—29.6)

1. In a process for the production of aqueous dispersions of polymers and copolymers of vinyl chloride by polymerizing vinyl chloride with up to its own weight of ethylenically unsaturated copolymerizable material in the presence of water containing a dissolved peroxy polymerization catalyst, the improvement which comprises obtaining polymer particles of large uniform size by initiating the polymerization in the absence of an emulsifying agent and introducing an emulsifying agent after the polymer content of the system has reached approximately 0.5% by weight of the polymerization system but before the polymer dispersion begins to coagulate, said emulsifying agent being introduced in an amount sufficient to provide mechanical stability but insufficient to impair the properties of the polymer contained in the dispersion produced.

---

2,771,458

**SOLUTIONS OF RUBBERY POLYMERS FROM PARTICLES OF UNIFORM DIAMETER**

Carli F. Van Glider, Roselle, and William C. Harvey, Elizabeth, N. J., assignors to Esso Research and Engineering Company, a corporation of Delaware

No Drawing. Application January 5, 1953, Serial No. 329,728

11 Claims. (Cl. 260—33.6)

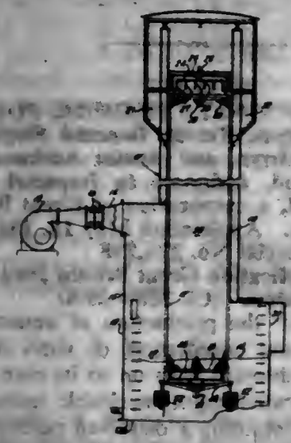
4. A process for preparing substantially lump-free homogeneous solutions of high molecular weight rubbery polymers in lubricating oil which comprises agitating with the lubricating oil at a temperature of about 300° F., polymer particles selected from the group of rubbery polymers consisting of natural rubber, the copolymer of butadiene and styrene, the copolymer of butadiene and acrylonitrile, polyisobutylene, polyethylene, and the copolymer of isobutylene and a diolefin selected from the group consisting of butadiene and isoprene, said polymer particles being of uniform size of not over ¼ inch diameter; the agitation being until at least about 6.0 weight percent of the polymer is solvated and until the viscosity of the resulting solution attains a minimum value of at least about 3,500 centistokes at 210° F.

2,771,459

## CATIONIC DERIVATIVES OF ITACONATE-DIENE COPOLYMERS

Fred W. Bonse and Erving Arundale, Westfield, N. J., assignors to Esso Research and Engineering Company, a corporation of Delaware

No Drawing. Application November 24, 1952, Serial No. 322,334
6 Claims. (Cl. 260—78.5)



1. A product comprising a salt of a copolymer of 65 to 90 parts dimethyl itaconate and 35 to 10 parts of a diolefin of 4 to 6 carbon atoms, the cation of said salt being selected from the group consisting of metals, ammonium and basic amine radicals.

2,771,460

## RESIDUAL PULP LIQUOR OXIDIZING MEANS

Lambert F. Kooistra, Akron, and Robert V. Cobb, Sebring, Ohio, assignors to The Babcock & Wilcox Company, New York, N. Y., a corporation of New Jersey

Application November 18, 1952, Serial No. 321,114
4 Claims. (Cl. 23—283)

1. In a tower for oxidizing residual liquor including means for passing air through said tower as an oxidizing medium, a reservoir in the lower portion of said tower, a plurality of upright closely horizontally spaced screens extending transversely across said tower and projecting downwardly beneath the surface of the oxidized liquor normally maintained within said reservoir, imperforated plate means embracing the upper end portion of each of said screens, each of said plate means bent in a V-shaped vertical section with the apex thereof in general vertical alignment with the upright plane of an adjacent screen and with adjacent plate means positioned in horizontally spaced nested relationship, and a plurality of spray nozzles disposed above the upper ends of said screens to deposit residual liquor on the upper end portions of said imperforated plates.

2,771,461

## PROCESS FOR COPOLYMERIZING ACRYLONITRILE AND ACRYLATE ESTERS

Harry H. Weinstock, Jr., Madison, N. J., assignor to Allied Chemical & Dye Corporation, New York, N. Y., a corporation of New York

No Drawing. Application April 30, 1952, Serial No. 285,310
5 Claims. (Cl. 260—85.5)

1. In a process for copolymerizing an ester of acrylic acid and a normal aliphatic alcohol of the homologous series methanol through n-nonyl alcohol with acrylonitrile in an acidic, aqueous reaction medium containing separate monomer phase dispersed therein, in the presence of hydrogen peroxide as a catalyst for the polymerization reactions, that improvement which comprises preparing a reaction mixture containing a ratio, by weight, of 25/75 to 90/10 of the acrylic acid ester/acrylonitrile, to which is added hydrogen peroxide and a copper salt soluble therein as the sole material present which can act as a reducing agent, in amounts such that said reaction mixture initially contains about 0.1% to about 6% $H_2O_2$, based on the total ester and nitrile, at least ¼ part per million of dissolved copper and a maximum of 6 parts per million dissolved copper, by weight of the reaction mixture, for every 1% of $H_2O_2$ present, and copolymerizing said ester and nitrile in the presence of the dissolved copper.

2,771,462

## METHOD FOR MAKING CERTAIN N-SUBSTITUTED POLYVINYL HETEROCYCLICS

Kwan-Ting Shen, Brentwood, Mo., assignor to Petrolite Corporation, Wilmington, Del., a corporation of Delaware

No Drawing. Application December 8, 1952, Serial No. 324,812
8 Claims. (Cl. 260—88.3)

1. A method for preparing polymeric quaternary ammonium salts from nitrogen-containing vinyl-substituted heterocyclic compounds which comprises slowly adding a carbon-vinyl-substituted heterocyclic compound selected from the class consisting of vinyl pyridine, vinyl pyrazine, vinyl piperidine, vinyl quinoline, alkylated vinyl pyridine, alkylated vinyl pyrazine, alkylated vinyl piperidine, and akylated vinyl quinoline to a monocarboxy acid having a reactive halogen attached to the alpha carbon atom which alpha carbon atom in turn is linked to a third atom selected from the class consisting of hydrogen and carbon atoms, and a fourth atom selected from the class consisting of hydrogen and halogen atoms, the reaction system consisting essentially of the reactants and the resultants of reaction.

2,771,463

## CATALYTIC PROCESS FOR ETHYLENE EMPLOYING NICKEL ON CARBON AND ALKALI METAL

Edmund Field, Chicago, and Morris Feller, Park Forest, Ill., assignors to Standard Oil Company, Chicago, Ill., a corporation of Indiana

No Drawing. Application August 20, 1953, Serial No. 375,560
17 Claims. (Cl. 260—94.9)

1. A process for the preparation of an ethylene polymer having a molecular weight of at least about 300, which process comprises contacting ethylene with catalytically effective amounts of an alkali metal and a catalyst comprising essentially a minor proportion of nickel supported upon a major proportion of an active carbon at a temperature between about 25° C. and about 250° C., and separating an ethylene polymer having a molecular weight of at least about 300 thus produced.

2,771,464

## NOVEL SIZING AGENTS FOR PAPER

Randall Hastings, Stamford, Erhart K. Drechsel, Springdale, and Edward Straughn, Stamford, Conn., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine

No Drawing. Application June 3, 1953, Serial No. 359,445
11 Claims. (Cl. 260—101)

1. A fortifying agent for rosin size, consisting essentially of the Diels-Alder reaction product of (*a*) rosin, (*b*) a material selected from the group consisting of maleic anhydride, maleic acid, and fumaric acid, and (*c*) dehydrated citric acid in molar ratio between about 10:8.5:1.5 and about 10:5:5 respectively, said agent being at least partly neutralized with an alkali metal alkali said dehydrated citric acid corresponding to the product obtained by heating citric acid at a temperature between about 175° C. and 200° C.

3. A fortified size consisting essentially of a minor proportion of the Diels-Alder reaction product of (*a*) rosin, (*b*) a material selected from the group consisting of maleic anhydride, maleic acid, and fumaric acid; and (*c*) dehydrated citric acid in molar ratio between about 10:8.5:1.5 and 10:5:5 respectively, and a major proportion of rosin, said reaction product and said rosin being at least partly neutralized with an alkali metal alkali said dehydrated citric acid corresponding to the product obtained by heating citric acid at a temperature between about 175° C. and 200° C.

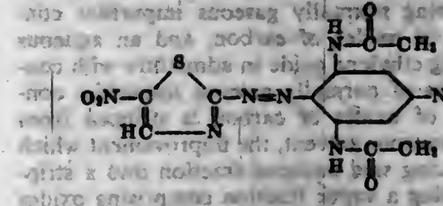
2,771,465

## ADSORPTION PROCESS FOR SEPARATING ELEMENTARY SULFUR FROM SULFURIZED DIARYL ALKANES

William B. Whitney, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware

No Drawing. Application October 9, 1951, Serial No. 250,565
10 Claims. (Cl. 260—139)

1. The removal of elementary sulfur from its admixture with a sulfurized diaryl alkane which has been prepared by sulfurizing a diaryl alkane under sulfurizing conditions which result in the presence of elementary sulfur in the sulfurized diaryl alkane which is produced, which comprises at ordinary temperatures, contacting said sulfurized diaryl alkane with silica gel thus causing the adsorption of said sulfurized diaryl alkane within the pores of said silica gel while at the same time elementary sulfur remains unadsorbed, washing said gel with a light paraffinic hydrocarbon thereby physically removing said elementary sulfur and any excess sulfurized diaryl alkane from the gel and then desorbing the sulfurized diaryl alkane from the gel by passing a desorbing agent into contact with said gel.



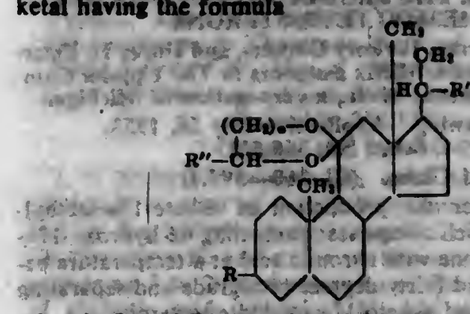
2,771,466

## 5-NITROTHIAZOLEAZO-N,N-DISUBSTITUTED M-ALKACYLAMINOANILINE COMPOUNDS

Edmund B. Towne and Joseph B. Dickey, Kingsport, Tenn., assignors to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey

No Drawing. Application February 13, 1953, Serial No. 336,671
3 Claims. (Cl. 260—158)

2. The azo compound having the formula:



2,771,467

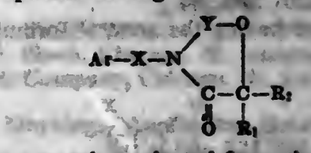
## STEROID KETALS

Barney J. Magerlein, Kalamazoo, and Robert H. Levin, Kalamazoo Township, Kalamazoo County, Mich., assignors to The Upjohn Company, Kalamazoo, Mich., a corporation of Michigan

No Drawing. Application August 31, 1954, Serial No. 453,445
16 Claims. (Cl. 260—239.55)

1. 3,20-dioxygenated-pregnane-11-one 11-cyclic monoketal having the formula

wherein R and R′ are selected from the group consisting of hydroxy, keto, and acyloxy of the formula AcO, Ac being the acyl radical of a hydrocarbon carboxylic acid containing from one to eight carbon atoms, inclusive; and wherein R″ is selected from the group consisting of hydrogen and lower-alkyl radicals containing from one to six carbon atoms, inclusive; and wherein *n* is an integer from one to two, inclusive.



2,771,468

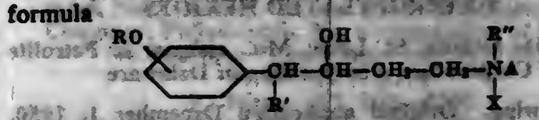
## 4-ARALKYL-3-MORPHOLONES, 4-ARALKYL-3-HOMOMORPHOLONES AND THEIR PREPARATION

Alexander R. Surrey, Albany, N. Y., assignor to Sterling Drug Inc., New York, N. Y., a corporation of Delaware

No Drawing. Application February 19, 1954, Serial No. 411,551
20 Claims. (Cl. 260—247.7)

1. A compound having the formula

where Ar is a member selected from the group consisting of phenyl, naphthyl, biphenylyl, furyl, pyridyl and thienyl radicals, X is a lower alkylene radical having one to four carbon atoms, Y is a lower alkylene radical having two to six carbon atoms and having its free valences separated by two to three carbon atoms, and $R_1$ and $R_2$ are each selected from the group consisting of hydrogen and lower alkyl radicals.



2,771,469

## QUATERNARY AMMONIUM SALTS OF DELTA-HYDROCARBYOXYPHENYL GAMMA-HYDROXY AMINES

Everett M. Schultz, Ambler, Pa., assignor to Merck & Co., Inc., Rahway, N. J., a corporation of New Jersey

No Drawing. Application December 30, 1953, Serial No. 401,390
6 Claims. (Cl. 260—247.7)

1. A quaternary ammonium salt having the structural formula

wherein R is selected from the group consisting of lower alkyl, mononuclear carbocylic aryl-lower alkyl and mononuclear carbocyclic aryl radicals; R′ is selected from the group consisting of lower alkyl, unsubstituted mononuclear carbocyclic alicyclic and mononuclear carbocyclic aryl-lower alkyl radicals; R″ is selected from the group consisting of lower alkyl, mononuclear carbocyclic aryl-lower alkyl, allyl and cinnamyl radicals, the aryl and alicyclic moieties of the radicals represented by R, R′ and R″ being unsubstituted and containing six atoms in the ring nucleus; NA is selected from the group consisting of di-lower alkyl amine, piperidyl and morpholinyl radicals; and X is an anion.

6. 4-(3-hydroxy-4-p-phenoxyphenyl-4-benzylbutyl)-4-methylmorpholinium iodide.

2,771,470

## POLYHALO-2,3-EPOXY-BICYCLO (2.2.1) HEPTANES

Victor Mark, Evanston, Ill., assignor to Universal Oil Products Company, Des Plaines, Ill., a corporation of Delaware

No Drawing. Application June 16, 1954, Serial No. 437,281
20 Claims. (Cl. 260—327)

1. A process for the preparation of a saturated bicyclic compound which comprises reacting an unsaturated bi-

cyclic compound with an epoxidizing agent, and recovering the resultant epoxy-substituted saturated bicyclic compound, said unsaturated bicyclic compound having the general formula:

in which V is selected from the group consisting of hydrogen, alkyl and halogen radicals, W and X are selected independently from the group consisting of halogen and hydrogen radicals, Y is selected from the group consisting of halogen, haloalkyl, alkyl and hydrogen radicals, and Z is selected from the group consisting of nitro, nitroso, cyano and thiocyano radicals.

10. A compound having the general formula:

in which A is selected from the group consisting of oxygen and sulfur radicals, V is selected from the group consisting of hydrogen, alkyl and halogen radicals, W and X are selected independently from the group consisting of halogen and hydrogen radicals, Y is selected from the group consisting of halogen, haloalkyl, alkyl and hydrogen radicals, and Z is selected from the group consisting of nitro, nitroso, cyano and thiocyano radicals.

15. The compound 2,3 - epithia - 5 - nitro-6-trichloromethylbicyclo[2.2.1]-heptane.

---

2,771,471

## POLYCARBOXY ACID ESTERS OF OXYPROPYLATED HEXIDES

Melvin De Groote, St. Louis, Mo., assignor to Petrolite Corporation, a corporation of Delaware

No Drawing. Original application December 1, 1950, Serial No. 198,756. Divided and this application December 2, 1952, Serial No. 323,732

8 Claims. (Cl. 260—347.4)

1. Hydrophile synthetic products, said hydrophile synthetic products being characterized by the following formula

in which R' is a hexide radical; $n$ and $n'$ are numerals with the proviso that $n$ and $n'$ equal a sum varying from 15 to 80, and R is the radical of a dicarboxy acid selected from the group consisting of acyclic and isocyclic dicarboxy acids having not more than 8 carbon atoms and composed of carbon, hydrogen and oxygen of the formula:

and with the further proviso that the parent dihydroxylated compound prior to esterification be water-insoluble.

2,771,472

## EPOXYOCTADECYL ADIPATES

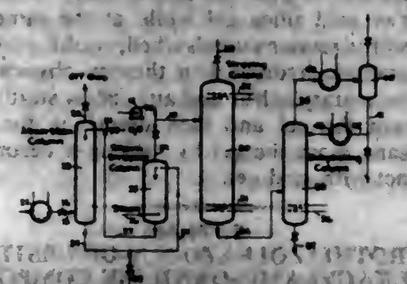
Arthur W. Ritter, Jr., Haddon Heights, N. J., and Stanley P. Rowland, Philadelphia, Pa., assignors to Rohm & Haas Company, Philadelphia, Pa., a corporation of Delaware

No Drawing. Application August 30, 1954, Serial No. 453,119

5 Claims. (Cl. 260—348)

1. As a new composition of matter, an epoxidized ester of (*a*) adipic acid and (*b*) at least one unsaturated alcohol from the class consisting of oleyl, linoleyl and linolenyl alcohols, said epoxidized ester containing an average of at least 70 epoxy groups for every hundred alcohol moieties in said ester.

---



2,771,473

## ETHYLENE OXIDE RECOVERY

Martin L. Courter, Walnut Creek, Calif., assignor to Shell Development Company, Emeryville, Calif., a corporation of Delaware

Application January 11, 1954, Serial No. 403,337

6 Claims. (Cl. 260—348)

1. In a process for separating ethylene oxide from a gaseous mixture containing ethylene oxide in admixture with normally gaseous materials comprising oxides of carbon wherein ethylene oxide is separated from said mixture by absorption in an aqueous solvent thereby forming a fat aqueous solvent rich in dissolved ethylene oxide and containing normally gaseous impurities consisting essentially of oxides of carbon, and an aqueous fraction comprising ethylene oxide in admixture with contaminating amounts of normally gaseous impurities consisting essentially of oxides of carbon is stripped from said resulting fat aqueous solvent, the improvement which comprises introducing said aqueous fraction into a stripping zone, separating a vapor fraction comprising oxides of carbon from a liquid fraction consisting essentially of aqueous ethylene oxide free of any substantial amount of oxides of carbon in said stripping zone, passing said liquid fraction from said stripping zone into a dehydrating zone, and distilling a vapor fraction consisting essentially of ethylene oxide from said liquid fraction in said dehydrating zone.

---

2,771,474

## PROCESS FOR THE PRODUCTION OF 6-KETO-17α-METHYLTESTOSTERONE

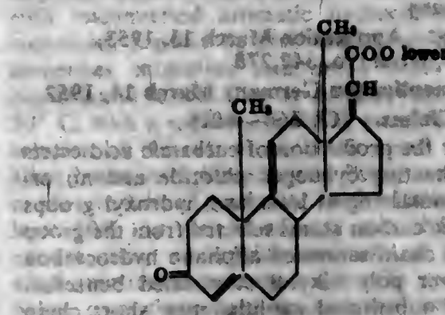
Herbert C. Murray, Hickory Corners, and Darey H. Peterson, Kalamazoo, Mich., assignors to The Upjohn Company, Kalamazoo, Mich., a corporation of Michigan

No Drawing. Application July 16, 1953, Serial No. 368,521

1 Claim. (Cl. 260—397.4)

A process for the production of 6-keto-17α-methyltestosterone which comprises: contacting 6β-hydroxy-17α-methyltestosterone with chromic acid at a temperature between fifteen and thirty degrees centigrade and separating the thus-produced 6-keto-17α-methyltestosterone.

2,771,475



## STEROIDS

John A. Hogg, Kalamazoo Township, Kalamazoo County, Philip F. Beal, Portage Township, Kalamazoo County, and Alan H. Nathan and Frank H. Lincoln, Jr., Kalamazoo Township, Kalamazoo County, Mich., assignors to The Upjohn Company, Kalamazoo, Mich., a corporation of Michigan

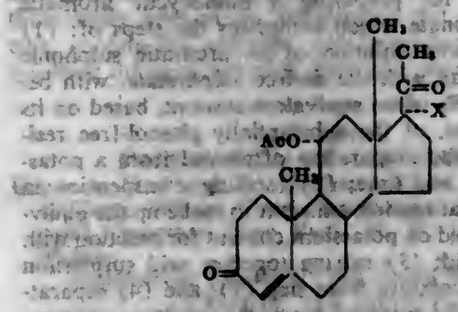
No Drawing. Application December 17, 1954, Serial No. 476,057

3 Claims. (Cl. 260—397.1)

1. Lower-alkyl 3 - keto - 4,9(11),17(20)-pregnatriene-21-oate having the formula:

---

2,771,476



## 11α-ACYLOXY-17α-HALO-4-PREGNENE-3,20-DIONE AND PROCESS

Douglas A. Lyttle and Robert H. Levin, Kalamazoo Township, Kalamazoo County, Mich., assignors to The Upjohn Company, Kalamazoo, Mich., a corporation of Michigan

No Drawing. Application August 27, 1953, Serial No. 376,908

14 Claims. (Cl. 260—397.45)

1. An 11α - acyloxy - 17α - halo - 4 - pregnene - 3,20-dione of the formula:

wherein Ac is the acyl radical of a hydrocarbon carboxylic acid containing not more than eight carbon atoms and wherein X is selected from the group consisting of chlorine and bromine.

---

2,771,477

## LOW VOLATILE HERBICIDAL COMPOSITIONS

Lindley S. De Ady, Kansas City, Mo., Edwin T. Upton, Mission, Kans., and John D. Howland, Kansas City, Mo., assignors to Thompson-Hayward Chemical Company, Kansas City, Mo., a corporation of Missouri

No Drawing. Application June 6, 1952, Serial No. 292,186

3 Claims. (Cl. 260—404)

1. A herbicidal composition containing as an active ingredient an ester of a polyalkanolamine having a portion of the hydroxy groups esterified with an aryloxyalkane-carboxylic acid and a portion esterified by an acid containing 7 to 20 carbon atoms of the group consisting of aliphatic acids, olefinic acids and naphthenic acids.

2,771,478

## PRODUCTION OF CARBOXYLIC ACID ESTERS

Walter Reppe, Ludwigshafen (Rhine), Herbert Friedrich, Worms, and Klaus Wiebusch, Heidelberg, Germany, assignors to Badische Anilin- & Soda-Fabrik Aktiengesellschaft, Ludwigshafen (Rhine), Germany

No Drawing. Application August 12, 1952, Serial No. 304,018

Claims priority, application Germany September 8, 1951

7 Claims. (Cl. 260—486)

1. In the production of carboxylic acid esters by the interaction of olefinic hydrocarbons with carbon monoxide and aliphatic alcohols in the presence of compounds of carbonyl-forming metals, the step which comprises carrying out the reaction in a liquid medium having dissolved a catalyst comprising both nickel carbonyl and a member selected from the group consisting of alkali metal cyanides and ammonium cyanide.

---

2,771,479

## INSECTICIDAL COMPOUNDS

Herman S. Bloch, Chicago, Ill., assignor to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware

No Drawing. Application October 17, 1949, Serial No. 121,890

11 Claims. (Cl. 260—407)

1. The condensation product of a polyhalogenated cyclic diene selected from the fluoro and chloro poly substituted cyclopentadienes and cyclohexadienes containing not more than 10 carbon atoms per molecule with a compound selected from the fatty acids containing at least one double bond per molecule, and from their alcohol esters, amides and metallic, ammonium and substituted ammonium salts, said fatty acid compound containing at least 8 carbon atoms per molecule.

---

2,771,480

## PURIFICATION OF GLYCERIDE OILS BY MEANS OF ION-EXCHANGE RESINS

Martin G. Chiznov, Newport, Del., Robert Kunin, Trenton, N. J., and Morris Mattikow and Benjamin H. Thurman, New York, N. Y., assignors of one-half to Benjamin Clayton, doing business as Redskin, Unincorporated, New York, N. Y., and one-half to Rohm & Haas Company, Philadelphia, Pa., a corporation of Delaware

No Drawing. Application July 29, 1953, Serial No. 371,174

9 Claims. (Cl. 260—420)

1. The process of refining a glyceride oil containing free fatty acids and color-bodies which comprises bringing said oil in contact with particles of a strongly basic anion-exchange resin containing quaternary ammonium hydroxide groups, adsorbing said fatty acids and said color-bodies on said resin, separating the oil and resin, removing adsorbed color-bodies from said resin by treating the resin with a solution of an oxidizing agent which is a member of the class consisting of aqueous solutions of inorganic hypochlorites and of hydrogen peroxide and removing said adsorbed fatty acids from said resin by treating the resin with a solution of a caustic alkali.

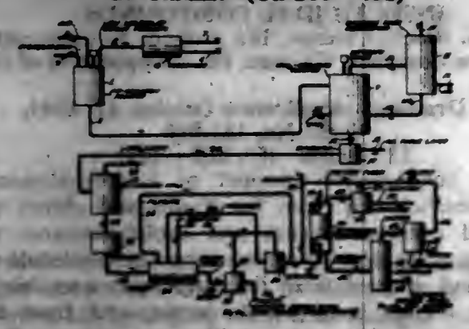
## CATALYTIC CARBON MONOXIDE HYDROGENATION

Walter Rottig, Oberhausen-Sterkrade-Nord, Germany, assignor to Ruhrchemie Aktiengesellschaft and Lurgi Gesellschaft für Wärmetechnik m. b. H., both German corporations

No Drawing. Application March 7, 1951, Serial No. 214,423

Claims priority, application Germany April 20, 1950

6 Claims. (Cl. 260—449.6)



1. In the hydrogenation of carbon monoxide using a catalyst selected from the group consisting of iron,

nickel and cobalt, the improvement which comprises thoroughly drying the catalyst for 6 to 24 hours at temperatures of 150 to 350° C., contacting the dried catalyst in layers of more than 100 cm. high within a synthesis zone with a gas selected from the group consisting of carbon monoxide, hydrogen and mixtures thereof at a linear flow speed of about 100 to 200 cm./sec. and thereafter intimately contacting said treated catalyst with a carbon monoxide hydrogenation synthesis gas mixture in said synthesis zone.

## 2,771,482
## NITRIC ACID OXIDATION OF HYDROCARBONS

George P. Brown, Jr., West Deer Township, Allegheny County, Edgar L. Crowley, Pittsburgh, and Norman W. Franke, Penn Township, Allegheny County, Pa., assignors to Gulf Research & Development Company, Pittsburgh, Pa., a corporation of Delaware

Application August 26, 1953, Serial No. 376,616
17 Claims. (Cl. 260—452)

1. A process for the production of dibasic acids from a charge stock consisting essentially of saturated aliphatic hydrocarbons boiling above about 250° F. and having at least eight carbon atoms, comprising subjecting the charge stock to oxidation with an oxygen-containing gas for a time sufficient to obtain a product having a saponification number above about 100 and thereafter subjecting said product to further oxidation at an elevated temperature of about 50° C. to about 150° C. with nitric acid having a concentration above about 50 percent for a time sufficient to obtain substantial amounts of dibasic acids while admixing with the gaseous mixture comprising nitrogen oxides formed during said nitric acid reaction an oxygen-containing gas in amounts and for a time sufficient to regenerate said nitrogen oxides, and employing the products resulting from said regeneration in said nitric acid reaction.

## 2,771,483
## METHOD OF PREPARING ALKYL ISOCYANATES FROM INORGANIC CYANATES

Theodore L. Bieber, Kew Gardens, N. Y.

No Drawing. Application August 12, 1953, Serial No. 373,887
6 Claims. (Cl. 260—453)

1. The process of preparing an alkyl isocyanate by reacting at temperatures around 200° C. an alkali metal cyanate with a trialkyl phosphate having the formula $(RO)_3PO$, where R is an alkyl group having from one to eight carbon atoms therein.

## 2,771,484
## SULFONATION OF ORGANIC HYDROXY COMPOUNDS

Bruno Blaser, Duesseldorf-Urdenbach, and Gunther Tischbirek, Duesseldorf-Benrath, Germany, assignors to Henkel & Cie. G. m. b. H., Duesseldorf-Holthausen, Germany, a corporation of Germany

No Drawing. Application September 14, 1953, Serial No. 380,083
Claims priority, application Germany September 19, 1952
14 Claims. (Cl. 260—459)

1. Process for the sulfonation of organic hydroxy compounds, the hydroxy groups being located at non-aromatic carbon atoms which comprises intimately contacting said hydroxy compounds with a polyether chlorosulfonic acid addition compound containing individual chlorosulfonic acid molecules molecularly bound to at least 3 ether oxygen atoms present in the polyether and recovering a sulfonated organic hydroxy compound.

## 2,771,485
## PRODUCTION OF CARBAMATE COMPOUNDS

Adolf Welke, Kronberg (Taunus), and Ulrich Hoffmann, Bad Homburg, Germany, assignors to Deutsche Gold- und Silber-Scheideanstalt vormals Roessler, Frankfurt am Main, Germany

No Drawing. Application March 13, 1953, Serial No. 342,278
Claims priority, application Germany March 14, 1952
7 Claims. (Cl. 260—482)

1. A process for the production of carbamic acid esters which comprises heating cyanogen chloride and an organic compound containing at least two hydroxyl groups attached to aliphatic carbon atoms selected from the group consisting of short chain saturated aliphatic hydrocarbon poly alcohols, lower poly alkylol substituted benzenes, lower poly alkylol substituted naphthalenes, short chain alkylene ether glycols and short chain alkylene thioether glycols to a reaction temperature between 60 and 120° C.

## 2,771,486
## PREPARATION OF AROMATIC POTASSIUM SULPHONATES

Petrus J. C. Kassenbrood, Geleen, Netherlands, assignor to Stamicarbon N. V., Heerlen, Netherlands

Application December 7, 1953, Serial No. 396,549
Claims priority, application Netherlands December 11, 1952
8 Claims. (Cl. 260—505)

1. A process for preparing a monocyclic aromatic potassium sulphonate which comprises the steps of: (1) treating an aqueous solution of an aromatic sulphonic acid corresponding with the desired sulphonate, with between 70 and 95% of an equivalent amount, based on its potassium content, of the substantially phenol-free residue obtained in the preparation of phenol from a potassium sulphonate and lime; (2) forming a suspension in water of additional residue sufficient to make up the equivalent amount based on potassium content for reaction with the sulphonic acid; (3) mixing together said suspension and the reaction mixture from step (1); and (4) separating suspended solid material from the resulting mixture.

## 2,771,487
## TERTIARY ALKYL SUBSTITUTED CYCLOHEXANE CARBOXYLIC ACIDS, DERIVATIVES THEREOF, AND METHOD FOR PRODUCING THE SAME

Rupert C. Morris, Berkeley, and Vernon W. Buls, Walnut Creek, Calif., assignors to Shell Development Company, Emeryville, Calif., a corporation of Delaware

No Drawing. Application December 26, 1950, Serial No. 202,810
6 Claims. (Cl. 260—514)

5. A process for preparing a tertiary alkyl-substituted cyclohexane carboxylic acid wherein the ring carbon atom bearing the tertiary alkyl group is at least one carbon atom removed from the ring carbon atom bearing the carboxyl group which comprises hydrogenating an alkaline aqueous solution of a relatively water soluble salt of a corresponding aromatic acid at a temperature above 150° C., and converting the resulting salt of the cyclohexanecarboxylic acid to the desired cyclohexane carboxylic acid.

## 2,771,488
## RECOVERING TERTIARY-ALKYL SUBSTITUTED BENZOIC ACID

Harry Sello, Berkeley, Calif., assignor to Shell Development Company, Emeryville, Calif., a corporation of Delaware

Application July 20, 1953, Serial No. 369,029
6 Claims. (Cl. 260—525)

1. The process for recovering a tertiary-alkyl substituted benzene carboxylic acid in a high state of purity from the crude oxidation products obtained by oxidizing the corresponding tertiary-alkyl substituted alkyl benzene, which crude oxidation products comprise said tertiary-alkyl substituted benzene carboxylic acid in admixture with unconverted aromatic hydrocarbons and oxygen-containing organic by-products of said oxidation, which comprises subjecting said crude oxidation products to liquid-liquid extraction at a temperature above about 50° C. with a solvent consisting essentially of an aqueous solution of the salt of an alkali metal with the tertiary-alkyl benzene carboxylic acid being recovered from said crude oxidation products, said solution containing at least 20% by weight of said salt, thereby forming an extract phase comprising said solvent and said tertiary-alkyl substituted benzene carboxylic acid and a raffinate phase comprising said unconverted aromatic hydrocarbons and said oxygen-containing organic by-products, and recovering said tertiary-alkyl substituted benzene carboxylic acid from said extract phase.

## 2,771,489
## CHEMICAL PROCESS

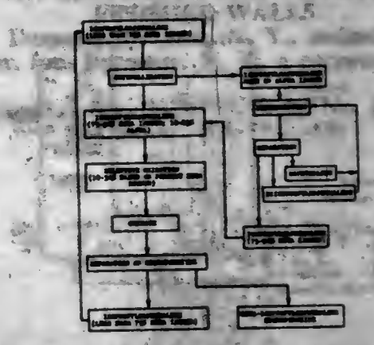
Ludwig F. Audrieth, Urbana, Ill., and Earle S. Scott, Amherst, Mass., assignors to University of Illinois Foundation, Urbana, Ill., a corporation of Illinois

No Drawing. Application November 14, 1955, Serial No. 546,834
3 Claims. (Cl. 260—552)

1. The process which comprises heating under reflux an aqueous solution containing ammonium thiocyanate and hydrazine in the ratio of from about two to about three mols ammonium thiocyanate per mol of hydrazine, cooling the solution, and thereafter separating the resulting thiosemicarbazide from the reaction liquor.

## 2,771,490
## PRODUCTION OF ACRYLAMIDE

Edgar A. Stoddard, Jr., Brighton, Mass., and Stewart F. Williams, Wilton, Conn., assignors to American Cyanamid Company, New York, N. Y., a corporation of Maine



Application August 3, 1955, Serial No. 526,138
2 Claims. (Cl. 260—561)

1. In a continuous process for recovering monomeric acrylamide from acrylamide sulfate which comprises neutralizing acrylamide sulfate with ammonia in an aqueous medium thereby precipitating ammonium sulfate giving an aqueous slurry comprising dissolved acrylamide and crystalline ammonium sulfate; the amount of ammonia being such as to neutralize substantially the entire sulfuric acid content of said acrylamide sulfate, and the amount of said acrylamide sulfate being such as to provide after neutralization an aqueous slurry substantially saturated with acrylamide at a temperature of at least 20° C.; maintaining the hydrogen ion concentration during neutralization at a range equivalent to a pH of about 2 to about 7; separating precipitated ammonium sulfate at a temperature of at least 20° C.; and treating residual liquor to recover an acrylamide product, the improvement in combination therewith which comprises: prior to said treatment, dividing said residual liquor into several streams, and recycling one stream to the neutralization step whereby the density of the aqueous ammonium sulfate slurry is maintained below a predetermined density while maintaining said slurry substantially saturated with acrylamide.

## 2,771,491
## SELECTIVE OXIDATION OF β-ISOPROPYLNAPHTHALENE TO β-ISOPROPYLNAPHTHALENE HYDROPEROXIDE

Joshua C. Conner, Jr., Wilmington, Del., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware

Application September 21, 1953, Serial No. 381,488
5 Claims. (Cl. 260—610)

1. The process which comprises contacting a mixture of α- and β-isopropylnaphthalene containing 75% to 90% β-isopropylnaphthalene with elementary oxygen under hydroperoxide-forming conditions until a hydroperoxide content is attained in the range of 10–30% and determined by the equation

$$X=4/3(Y-75)+10$$

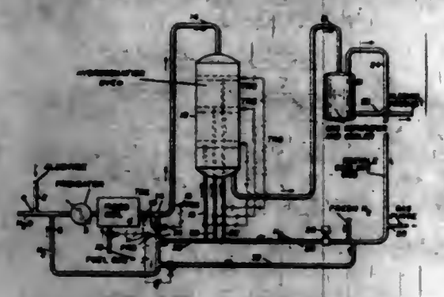
where X=percent conversion and Y is the percent β-isopropylnaphthalene in the mixture, whereby the β-isopropylnaphthalene is selectively oxidized to β-isopropylnaphthalene hydroperoxide, recovering unreacted isopropylnaphthalene impoverished in β-isopropylnaphthalene from the oxidation reaction and cooling to a temperature in the range of −70 to 10° C. such that crystals form, separating crystalline isopropylnaphthalene containing at least about 75% β-isopropylnaphthalene and recycling to the oxidation reaction.

## 2,771,492
## PRODUCTION OF DODECANOYL PEROXIDE

James Chapman and William Allenby Wynne, Widnes, England, assignors to Imperial Chemical Industries Limited, a corporation of Great Britain

No Drawing. Application July 28, 1954, Serial No. 446,404
Claims priority, application Great Britain August 7, 1953
7 Claims. (Cl. 260—610)

1. A process for the manufacture of dodecanoyl peroxide which comprises reacting dodecanoyl chloride ($C_{11}H_{23}COCl$) with 0.4 to 4 moles of hydrogen peroxide and 0.9 to 1.5 moles of a caustic alkali selected from the group consisting of sodium hydroxide and potassium hydroxide, the hydrogen peroxide being in the form of an aqueous solution containing 20% to 60% by weight of hydrogen peroxide and the hydroxide being in the form of an aqueous solution containing 10% to 45% by weight of hydroxide when the latter is sodium hydroxide and 14% to 50% by weight of hydroxide when the latter is potassium hydroxide, at a temperature in the range of −10° C. to 5° C.



## 2,771,493
## ALDEHYDE HYDROGENATION QUENCH

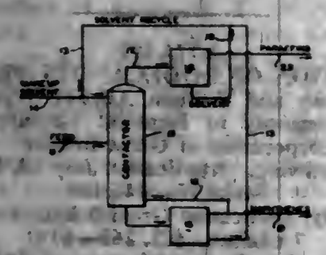
Robert L. Jacks, James E. Moles, and Edward W. S. Nicholson, Baton Rouge, La., assignors to Esso Research and Engineering Company, a corporation of Delaware

Application March 23, 1953, Serial No. 343,992
13 Claims. (Cl. 260—638)

1. In the process wherein aldehydes are hydrogenated to alcohols in a catalytic hydrogenation zone at elevated temperatures and pressures and wherein said aldehydes

are heated to hydrogenation temperatures in a heating zone and said heated aldehydes passed to said hydrogenation zone, the improvement which comprises maintaining an extraneous cooling fluid at a pressure above and a temperature below those obtaining in said hydrogenation zone, continuously passing a minor portion of said fluid into the aldehyde-comprising stream passing

from said heating zone into said hydrogenation zone, and passing a further portion of said fluid into said stream when the temperature of said stream exceeds a predetermined maximum, said added quantity being in amounts sufficient to decrease the temperature of said aldehyde-comprising stream to less than said predetermined maximum.



---

2,771,494

## SELECTIVE SOLVENT EXTRACTION OF NAPHTHENE HYDROCARBONS EMPLOYING 2-PYRROLIDONE

John A. Woodhams, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware

Application March 12, 1953, Serial No. 341,943
12 Claims. (Cl. 260—666)

1. A process for the separation and recovery of a naphthene hydrocarbon from an aromatic-free mixture of naphthene hydrocarbons and paraffin hydrocarbons having similar boiling points, which comprises contacting said mixture with liquid 2-pyrrolidone at a temperature in the range 100 to 350° F.; recovering a solvent phase; and recovering a naphthene hydrocarbon from said solvent phase.

---

2,771,495

## DEHYDROALKYLATION OF UNSATURATED CYCLIC HYDROCARBONS

Herman Pines and Jerome A. Vesely, Evanston, Ill., assignors to Universal Oil Products Company, Des Plaines, Ill., a corporation of Delaware

No Drawing. Application November 13, 1953, Serial No. 392,046
13 Claims. (Cl. 260—668)

1. A process for the dehydroalkylation of an unsaturated cyclic hydrocarbon containing a six-membered geminal carbon atom free ring and at least two double bonds per molecule, at least one of said double bonds being in said ring, said hydrocarbon containing at least one substituent selected from the group consisting of alkyl and alkenyl radicals, attached to said ring which comprises reacting said hydrocarbon with an aliphatic olefin in the presence of a catalyst selected from the group consisting of alkali metals and hydrides thereof, under hydrogen transfer conditions.

8. A process for the dehydroalkylation of d-limonene which comprises reacting said limonene with ethylene in the presence of a catalyst consisting of sodium and o-chlorotoluene at temperatures ranging from about 100° C. to about 300° C.

---

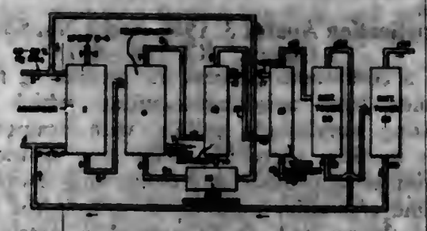
2,771,496

## PROCESS FOR THE PRODUCTION OF SECONDARY ALKYLARYL HYDROCARBONS

George L. Hervert, Downers Grove, Ill., assignor to Universal Oil Products Company, Chicago, Ill., a corporation of Delaware

No Drawing. Application May 26, 1951, Serial No. 228,538
7 Claims. (Cl. 260—671)

1. A process for the production of an alkylaryl hydrocarbon having an alkyl substituent containing from about 9 to about 18 carbon atoms per substituent joined to the aryl nucleus through a secondary carbon atom of said alkyl substituent which comprises reacting an alkyl halide containing from about 7 to about 16 carbon atoms per molecule with ethylene to form a primary alkyl halide containing from about 9 to about 18 carbon atoms per molecule, and condensing said primary alkyl halide with an aromatic hydrocarbon containing a nuclearly displaceable hydrogen atom to form said alkylaryl hydrocarbon.



---

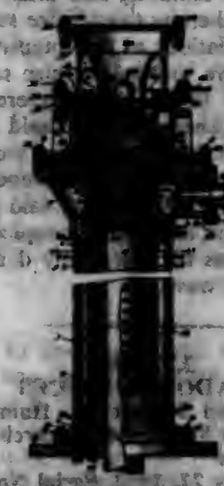
2,771,497

## METHOD OF PURIFYING ISOBUTYLENE

John C. Hunt, Linden, Stanley E. Jaros, Watchung, and Joseph F. Nelson, Rahway, N. J., assignors to Esso Research and Engineering Company, a corporation of Delaware

Application November 19, 1952, Serial No. 321,328
2 Claims. (Cl. 260—677)

1. In a process for the preparation of pure isobutylene suitable for the preparation of solid polymers wherein an isobutylene stream containing methyl mercaptan is absorbed in about 65% sulfuric acid at a temperature of 70–100° C. to produce an acid extract and wherein isobutylene is regenerated from the acid extract by heating it to a temperature of about 250° C. in the presence of water, whereby isobutylene containing small amounts of methyl mercaptan is obtained, the improvement which comprises distilling the isobutylene stream in a first distillation zone to remove overhead the methyl mercaptan as an isobutylene-methyl mercaptan distillate by virtue of its property of forming a minimum boiling azeotrope with isobutylene and a methyl mercaptan free bottoms, recycling the distillate to the acid absorption step.



# ELECTRICAL

2,771,498

## ELECTRODE FEED OR DRIVE MECHANISM

Kurt R. Breitschädter and Frank M. Ozak, Chicago, Ill., assignors to Crane Co., Chicago, Ill., a corporation of Illinois

Application April 18, 1955, Serial No. 502,070
18 Claims. (Cl. 13—14)

1. In an electrode drive for an arc melting furnace or the like, the combination of an internally threaded driven cylinder, a drive bushing engaged with the said driven cylinder, head means for the electrode having means depending therefrom including an insulation pin engageable with said drive bushing for supporting the electrode, the said driven cylinder having oppositely disposed portions for receiving the said insulation pin, and means for cooling said cylinder.

---

2,771,499

## ELECTRIC BATTERY PLATE AND METHOD OF PRODUCING THE SAME

Arthur Fletcher, Northampton, Mass., assignor to Nickel Cadmium Battery Corporation, Easthampton, Mass., a corporation of Delaware

No Drawing. Application December 9, 1952, Serial No. 325,037
10 Claims. (Cl. 136—24)

3. A secondary electric battery comprising a porous, active material carrier composed essentially of nickel and having functionally active material within its pores consisting essentially of cadmium with a portion of indium amounting to between ½% to 2% of the amount of cadmium.

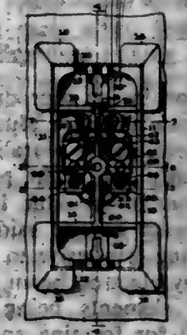
---

2,771,500

## STORAGE BATTERY PLATE

Howard J. Strauss, Philadelphia, and Harold C. Riegg, Lansdowne Manor, Pa., assignors to The Electric Storage Battery Company, a corporation of New Jersey

No Drawing. Application December 29, 1951, Serial No. 264,281
8 Claims. (Cl. 136—30)



In a silver oxide-zinc battery containing an alkaline electrolyte, the improvement consisting of a positive plate characterized by an enclosing sheath consisting of magnesium oxide and magnesium carbonate, said sheath being sufficiently porous to permit the passage of electrolyte therethrough, said said sheath having been produced by dipping said plate in an aqueous suspension of magnesium hydroxide, and air drying the plate so dipped.

2,771,501

## CONVENIENCE OUTLET FOR INSTALLATION IN FINISHED WALLS

Victor R. Despard, Syracuse, N. Y., assignor to Pass & Seymour, Inc., Syracuse, N. Y., a corporation of New York

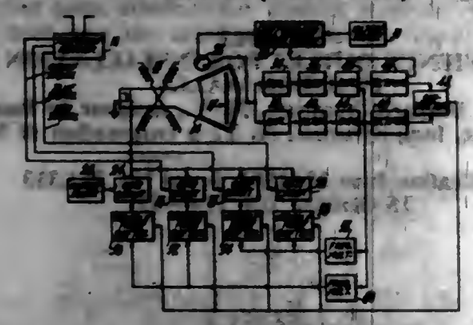
Application June 25, 1951, Serial No. 233,313
15 Claims. (Cl. 174—53)

1. An electric wiring box for mounting from the room side in a rectangular opening in a finished wall and be held therein by straps engaging the wall back, passing along the edges of the opening and bent over the front edges of the box walls, said box being of integral moulded plastic insulation having ends and sides forming a rectangular configuration open at the front and a wall closing the back, an integral flange ear on each front corner of the box projecting to engage the room face of the wall adjacent both an end and a side of the opening, the ears being spaced apart on each of the ends of the box for the passage of a mounting strap therebetween, a partition integral with said box adjacent each end thereof to provide a compartment to receive the bent-in portion of a mounting strap to isolate it from the central compartment between said partitions and plug blade receiving contact means permanently mounted in said last compartment.

---

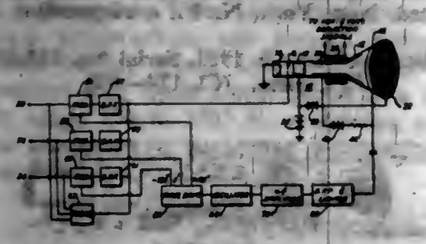
2,771,502

## SPLICE CLOSURE FOR SHEATHED CABLE



John H. King, Chatham, and Walter C. Kleinfelder, Summit, N. J., assignors to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application May 10, 1951, Serial No. 225,576
15 Claims. (Cl. 174—92)



3. A splice closure for joints in sheathed cable and the like comprising an elongated housing, a cable confined in said housing and extending from each end thereof, the sheath of the confined cable, adjacent the ends of said housing, slit longitudinally to provide outwardly extending tab portions, clamping means in the ends of said housing for gripping therebetween said tab portions, means in the ends of said housing comprising resilient bushings, for sealing the ends thereof and longitudinally extending bolts passing through said clamping means and said bushings for simultaneously causing the deformation of said sealing means and the compression of said clamping rings.

2,771,503
COLOR TELEVISION SYSTEM
James W. Schwartz, Princeton, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application October 25, 1954, Serial No. 464,500
15 Claims. (Cl. 178—5.4)

1. A color television image reproducing system comprising an image screen having a plurality of light producing strip-like elements and a plurality of signal generating strip-like elements, said light producing strip-like elements being responsive to emit light energy when excited by electron beam energy, said signal generating strip-like elements being responsive to generate a control signal when excited by electron beam energy, said signal generating strip-like elements being of at least two different areas, means for forming an electron scanning beam for exciting said strip-like elements, controlled modulating means for intensity modulating said electron beam with different signals during different intervals of modulation, each of said intervals of modulation substantially coinciding in time with a particular impinging time interval when said electron beam excites certain of said strip-like elements, sensing means for sensing said control signal, filtering means for selecting certain frequency components of said control signal to generate frequency component signals, signal combining means for combining certain of said frequency component signals to form a restoration signal, varying means connected to receive said restoration signal, said varying means for varying said interval of modulation with respect to said impinging time interval according to said restoration signal.

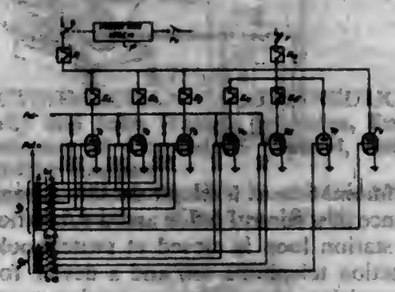
2,771,504
COLOR TELEVISION INDEXING SYSTEM
Robert C. Moore, Erdenheim, and Richard G. Clapp, Haverford, Pa., assignors to Philco Corporation, Philadelphia, Pa., a corporation of Pennsylvania
Application December 11, 1951, Serial No. 261,014
11 Claims. (Cl. 178—5.4)

1. A cathode ray tube system comprising a cathode ray tube having a source of an electron beam, control means for varying the intensity of the beam and a beam intercepting member, said beam intercepting member comprising a plurality of first portions arranged in a given geometric configuration and adapted to produce a given response upon electron impingement, said first portions recurring over the surface of said intercepting member at a given periodicity, said member further comprising a plurality of second portions arranged in a second given configuration indicative of said first configuration and adapted to produce a second given response different from said first response upon electron impingement, said second portions recurring over the surface of said member at a periodicity fractionally related to the periodicity of said first portions by the value

$$\frac{2}{2n+1}$$

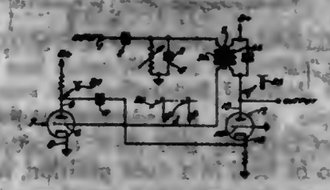
where $n$ is a whole number greater than zero, means for producing a wave having variations indicative of desired variations of the response of said first portions and having a component with a frequency spectrum arranged about a frequency having a value substantially proportional to the number of said periodically arranged first portions, means for applying said wave to said beam intensity control means, means for scanning said beam across said first and second portions thereby to energize said first portions proportionally to variations of the intensity of said beam produced by said wave and to energize said second portions, means coupled to said beam intercepting member and responsive to the energization of said second portions by said scanning beam for producing a second wave comprising a component having a frequency spectrum as determined by the rate of scanning said periodically arranged second portions, and means coupled to said second wave producing means for selectively deriving said component of said second wave.

2,771,505
READOUT DEVICES
Harold T. Avery and Robert W. Hampton, Oakland, Calif., assignors to Marchant Research, Inc., a corporation of California
Application July 21, 1953, Serial No. 369,483
8 Claims. (Cl. 178—23)

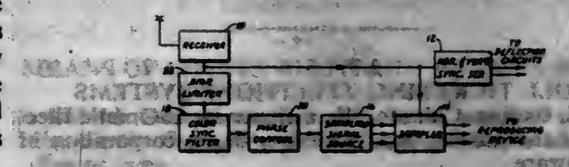


1. In a device of the class described having, ordinally spaced cyclically movable members bearing ordinal characters formed of magnetically permeable material, ordinally spaced pulsing shoes disposed in spaced relation to the cyclic path of said characters, and a movable magnetic tape; the combination of, means for continuously moving said members at a uniform cyclic speed, means for continuously moving said tape between said members and said pulsing shoes at a uniform speed in timed relation to the cyclic speed of said members, means for producing ordinal signals corresponding to ordinally selected ones of said characters, and a circuit operable under control of the signal producing means for independently energizing each pulsing shoe synchronously with the alignment of each ordinally selected character and a predetermined transverse line on said tape.

2,771,506
TELEPRINTER SYSTEMS
Jules Coquelet, Jumet-sur-Marcinelle, Belgium, assignor to Ateliers de Constructions Electriques de Charleroi, Brussels, Belgium, a company of Belgium
Application February 1, 1955, Serial No. 485,490
Claims priority, application France February 2, 1954
5 Claims. (Cl. 178—51)

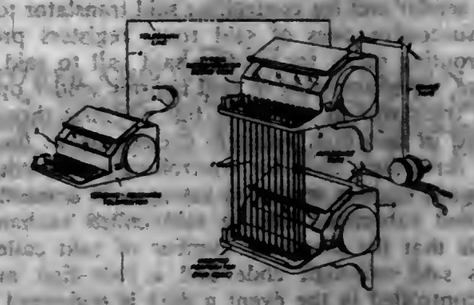


1. In a teleprinter system, an automatic tape transmitter having five contacts for sensing a tape perforated according to a five unit code, transmitting means connected to said contacts for producing in response to each five unit code group a first current having any one of eight different characteristics corresponding to three units of said code, and a second current having any one of four different characteristics corresponding to the other two units, means for receiving said first and second currents comprising twelve channels each including a tuned mechanically vibrating element for selecting a current having one of said characteristics, five electron tubes, a relay winding connected between the anode and cathode of each tube, means connecting said channels to the control electrodes of said tubes for controlling the biases of the control electrodes of three of said tubes selectively in response to said first current and the biases of the other two tubes selectively in response to said second current so that said tubes energize the relay windings



corresponding to the transmitted code group, a voltage control relay has its winding connected in series with the anode of each of said three tubes, said relay having contact means for applying anode voltage to said two tubes, a sixth tube, said means for controlling the biases being connected to the control electrode of the sixth tube for controlling said tube in response to a characteristic of the first current representing the absence of a pulse in said three units, the anode of the sixth tube being connected to said winding of the voltage control relay, a printing and control relay having a winding connected in series with the anode of each of said two tubes for operating said printing mechanism.

2,771,507
SELF-GATING SYNCHRONIZING CIRCUIT
Arnold M. Levine, River Edge, and Harry Altman, Belleville, N. J., assignors to International Telephone and Telegraph Corporation, Nutley, N. J., a corporation of Maryland
Application October 2, 1953, Serial No. 386,810
4 Claims. (Cl. 178—69.5)



1. In a television system having synchronizing signals, a blocking oscillator circuit to generate pulse signals having a rate of occurrence comparable to said synchronizing signals comprising a first electron discharge device having at least a cathode, an anode and a grid, a circuit for said grid, a time constant circuit having capacitive and resistive elements coupled to said grid circuit, means to couple said synchronizing signals to said grid circuit, a second electron discharge device having at least a cathode and an anode, means to couple the output from the anode of said first electron discharge device to the cathode of said second electron discharge device and inductive means to couple the output of the anode of said second electron discharge device to said grid circuit of said first electron discharge device.

2,771,508
COLOR SAMPLER SYNCHRONIZING SYSTEM
Edgar M. Creamer, Jr., Philadelphia, Pa., assignor to Philco Corporation, Philadelphia, Pa., a corporation of Pennsylvania
Application April 27, 1951, Serial No. 223,245
4 Claims. (Cl. 178—69.5)

1. A color television receiving system, comprising input means for a video wave having color signal components recurring at a given frequency and having a marker signal component having a frequency equal to said given frequency and having a given amplitude variation at spaced time intervals at a repetition rate substantially smaller than said given frequency, said marker signal component being characterized by a carrier component at said given frequency and sideband components closely related to said carrier component both in frequency and amplitude, means to sample said video wave at said given frequency to derive therefrom said color signal components, means for actuating said sampling means, said actuating means being responsive to signal energy at frequencies in the neighborhood of said given frequency and therefore being subject to possible operation at the frequency of one of said sideband components, means coupled to said input means for selecting said marker signal component from said video wave to the exclusion of said color signal components, and narrow band filter means connected between said selecting means and said actuating means for transmitting to the latter signal energy at the frequency of said carrier component and for attenuating signal energy at the frequencies of said sideband components, thereby to effect actuation of said sampling means at the frequency of said carrier component and to preclude actuation of the sampling means at the frequency of one of said sideband components.

2,771,509
SYNTHESIS OF SPEECH FROM CODE SIGNALS
Homer W. Dudley, Summit, N. J., and Cyril M. Harris, New York, N. Y., assignors to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application May 25, 1953, Serial No. 357,062
8 Claims. (Cl. 179—1)

1. Apparatus for the artificial production of speech-like sounds which comprises for each sound of speech a plurality of records of said speech sound as spoken under a like plurality of conditions which differ from each other in respect of the character of the possible preceding and following sounds, means for generating a succession of discrete code signals each of which is representative of one sound to be reproduced, means for simultaneously examining three successive ones of said code signals, means responsive to the identity of the second one of said recognized signals for selecting all of said plurality of

records corresponding to said second of said three successive signals, means for further selecting a single one among said plurality in dependence on the recognized character of the first and third of said code signals, and means for reproducing said finally selected record as an artificial speechlike sound.

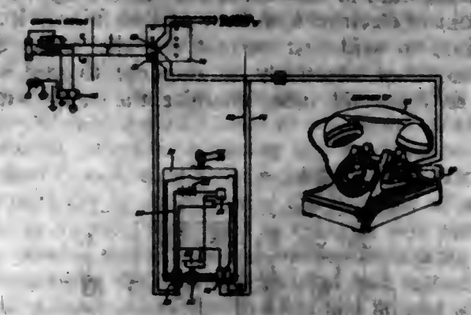
## TOLL TICKETING TELEPHONE SYSTEMS

John E. Outline, Chicago, Ill., assignor to Automatic Electric Laboratories, Inc., Chicago, Ill., a corporation of Delaware

Original application January 11, 1951, Serial No. 205,460. Divided and this application July 15, 1953, Serial No. 368,097

21 Claims. (Cl. 179—27)

1. In an automatic telephone system, a calling exchange, a single called exchange identified by both a two-digit and a three-digit code wherein the first digit of the two-digit code and the first digit of the three-digit code are identical and wherein the second digit of the two-digit code and the second digit of the three-digit code are identical, subscriber lines terminating in said called exchange identified by four-digit numbers wherein the first digit of said four-digit numbers assigned to subscriber lines utilizing said two-digit code as part of the directory number are identical to the third digit of said three-digit code, a register sender in said calling exchange including seven-digit registers and a plurality of route registers and a sender, means for registering in successive ones of said digit registers the two-digit code or the three-digit code identifying said called exchange and a four-digit number identifying a desired called subscriber line in said called exchange, a common translator, a translator assigner, means controlled by the registration of said first three digits in said digit registers for controlling said assigner to connect said translator to said register sender and for controlling said translator to register in successive ones of said route registers predetermined routing digits for routing said call to said called exchange, a register relay in said register sender operated by said translator in the event that the first three digits registered in said digit registers correspond to the digits of said three-digit code for controlling said sender portion of said register sender to set up said connection to said called subscriber line in said called exchange on the basis that the directory number of said called line includes said two-digit code and a four-digit number, means controlled in the event a digit is registered in the last register of said seven-digit registers for restoring said register relay so that said sender portion of said register sender is controlled to set up said connection to said called subscriber line in said called exchange on the basis that the directory number of said called line includes said three-digit code and a four-digit number, and means in said register sender operated by the registration of at least one digit in said route register for controlling said sender to transmit all of said predetermined digits registered in said route register and then the four-digit number identifying said called line registered in said digit registers.



2,771,511

## LINE CLEARING DEVICE FOR RECEIVER-OFF-HOOK CONDITION

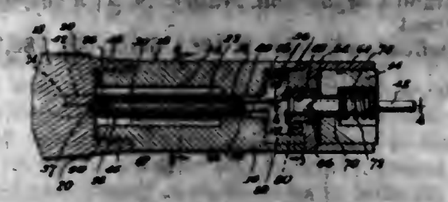
Richard S. Morris, Jr., Columbia, S. C., assignor to American Telephone and Telegraph Company, a corporation of New York

Application August 11, 1955, Serial No. 527,681

7 Claims. (Cl. 179—36)

1. The combination of a telephone line having a terminal appearance at a central office and a substation thereon and whose station loop is closed at switchhook contacts of the substation telephone set, and a device for clearing the line comprising an attachment having terminal connectors whereby said attachment may be inserted in said line between the central office appearance thereof and said substation and including a relay, a battery and a manually operable switch, switching means controlled by said relay when said attachment is inserted in said line for completing a connection between the closed switchhook contacts at said substation and the central office terminal appearance of said line by way of a conductor of said line, and means including said battery and said manually operable switch for operating said relay whereby said switching means functions to interrupt the connection completed thereby.

---



2,771,512

## TRANSDUCER

David J. Munroe, Racine, Wis., assignor to Webster Electric Company, Racine, Wis., a corporation of Delaware

Application May 12, 1951, Serial No. 225,968

8 Claims. (Cl. 179—100.41)

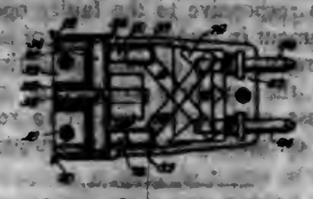
8. A multiple stylus transducer comprising a first transducer part carrying said styli, a second transducer part adapted to be held in a fixed position, means mounting said first part for unlimited rotation relative to said second part, and combined contact and positioning means carried on said first and second parts spaced one hundred eighty degrees from each other and movable into engagement with each other both to locate said first and second parts at angularly spaced predetermined positions relative to each other and to complete electrical connections between said first and second parts.

---

2,771,513

## TRANSDUCER

Clarence F. Jones, Racine, Wis., assignor to Webster Electric Company, Racine, Wis., a corporation of Delaware



Application August 15, 1951, Serial No. 241,909

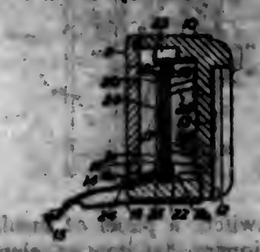
9 Claims. (Cl. 179—100.41)

1. A transducer, including in combination, a stylus actuated element having a generally vertically extending

portion adapted to be actuated by a stylus, means supporting said element for movement in a plane substantially perpendicular to a horizontal axis, and a pair of

bender type transducer elements connected to said vertically extending portion at points spaced on opposite sides of said horizontal axis.

---



2,771,514

## ELECTROMECHANICAL TRANSDUCERS

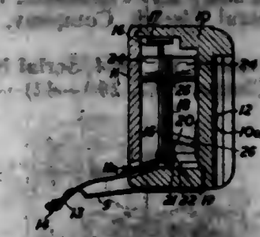
Stanley Kelly and John Watson Brownlee, Enfield, England, assignors to Connocord Limited, Enfield, England, a British company

Application March 10, 1952, Serial No. 275,776

6 Claims. (Cl. 179—100.41)

1. A gramophone pickup comprising a casing, a piezo-electric element mounted, aligned first and second pivot means at opposite edges of said element for mounting said element for pivotal movement in said casing, a cantilever arm, having a stylus thereon, connected to said element adjacent said first pivot means for transmission of motion to said element in response to motion imparted to said stylus in a desired direction by a record groove, and a rigid member extending longitudinally of and adjacent said element between said pivot means, said rigid member being secured rigidly to said element and only in the vicinity of said first pivot means for transmitting reaction forces imparted to said element in response to movement of said stylus in a direction generally at right angles to the said desired direction through said rigid member to said second pivot means.

---



2,771,515

## ELECTROMECHANICAL TRANSDUCERS

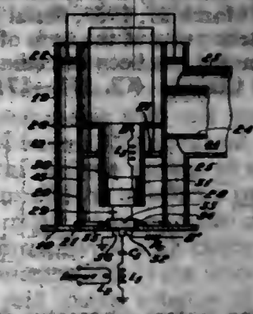
Stanley Kelly and John Watson Brownlee, Enfield, England, assignors to Connocord Limited, Enfield, England, a British company

Application March 10, 1952, Serial No. 275,775

8 Claims. (Cl. 179—100.41)

1. A gramophone pickup comprising a casing, a relatively rigid rod, pivot means mounting said rod at its end portions in said casing to render said rod capable of movement about its longitudinal axis, a cantilever arm extending laterally of said rod and secured at one end thereof to an end portion of said rod, a stylus secured to the other free end of said arm, said arm having a relatively low compliance for movement of the stylus in a radial direction about the longitudinal axis of said rod to follow the excursions of a record groove and said arm having a relatively high compliance in the direction of said longitudinal axis, and a piezo-electric crystal element secured to said rod only at the same end thereof as is said cantilever arm.

---



2,771,516

## MEANS OF COUPLING ENERGY TO OR FROM A COAXIAL RESONATOR

Arnold M. Buchsbaum, Grinnell, Iowa, assignor to Collins Radio Company, Cedar Rapids, Iowa, a corporation of Iowa

Application June 7, 1952, Serial No. 292,341

2 Claims. (Cl. 179—171)

2. Means for efficiently coupling an electron tube to an output coaxial line comprising, a ground plate, a first hollow conducting cylindrical member attached to said ground plate, a second hollow conducting cylindrical member mounted concentrically within said first cylindrical member, an annular dielectric member attached between an end of said second cylindrical member and said ground plate, a disc mounted within said second hollow cylindrical member, an inner conducting cylindrical member attached to said disc and extended toward said ground plate, a first tuning plunger generally annular in shape mounted between said first and second cylindrical members, a second tuning plunger annular in shape mounted between said second cylindrical member and said inner cylindrical member, the outer conductor of said output coaxial line connected transversely to said first cylindrical member, and the inner conductor of said output coaxial line connected transversely to said second cylindrical conductor, said electron tube coaxially supported with its plate connected to said inner cylindrical member and its grid connected to said ground plate, whereby an impedance match is obtained between said coaxial line and the plate of said tube by tuning said plungers.

---

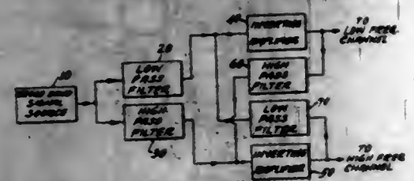
2,771,517

## POWER AMPLIFIER FOR TELEVISION

Charles W. Harrison, Gillette, and George Nielsen, Jr., Bernardsville, N. J., assignors to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York

Application December 28, 1953, Serial No. 400,561

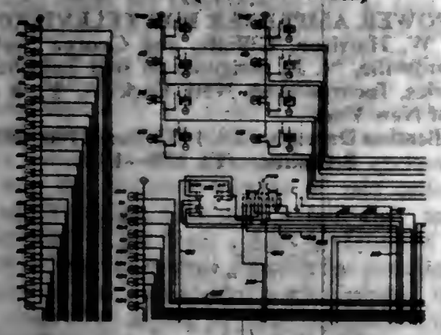
8 Claims. (Cl. 179—171)



1. An amplifier including an input terminal, means for applying a varying signal to said input terminal, means including a multiple feed arrangement for providing current to said amplifier, said current means being selected so that in the absence of said signal substantially all of

the current to said amplifier is carried in a first arm of said feed arrangement and in the presence of said signal the differential current resulting therefrom is carried in the second arm of said feed, said second arm comprising a plurality of impedances connected in series, feedback means connected between a junction of said impedances and said input terminal, and a bias means connected to said input terminal whereby an additional current may be caused to flow in said second arm.

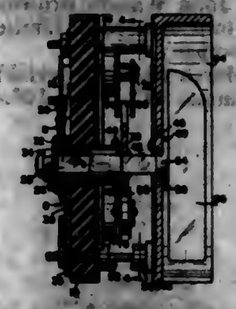
---



2,771,518
FREQUENCY BAND SEPARATION AMPLIFIER SYSTEM
George C. Sziklai, Princeton, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application March 27, 1953, Serial No. 345,014
The terminal fifteen years of the term of the patent to be granted has been disclaimed
8 Claims. (Cl. 179—171)

1. In a signaling system, apparatus for separating the high frequency components of a signal from the low frequency components of said signal, said apparatus comprising in combination a low pass network, a high pass network, means for cophasally applying said signal to said low pass network and to said high pass network, a pair of phase inverters each having respective input and output circuits, the input circuit of one of said pair of phase inverters being coupled to said low pass network, the input circuit of the other of said pair of phase inverters being coupled to said high pass network, a feedback circuit coupling the output circuit of said one phase inverter to the input circuit of said other phase inverter, a second high pass network being included in said feedback circuit, and an additional feedback circuit coupling the output circuit of said other phase inverter to the input circuit of said one phase inverter, a second low pass network being included in said additional feedback circuit.

---



2,771,519
ROUTINE TRUNK TEST CIRCUIT
Robert C. Nance, Wood-Ridge, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application June 29, 1955, Serial No. 518,769
11 Claims. (Cl. 179—175.2)

1. A routine testing circuit for testing a plurality of pieces of automatic telephone equipment, means in said testing circuit to connect with said pieces of equipment in succession, means responsive to the connection of said testing circuit with one of said pieces of equipment to make a plurality of tests of the connected piece of equipment, means in said testing circuit responsive to the correct operation of said piece of equipment in response to said plurality of tests to cause said connecting means to connect said test circuit with another piece of equipment, class of trouble indicating means in said testing circuit, means responsive to the faulty operation of said piece of equipment in response to one of said plurality of tests for operating one of said indicating means, and means under the selective control of said indicating means to cause said testing circuit to repeat said plurality of tests on said one piece of equipment.

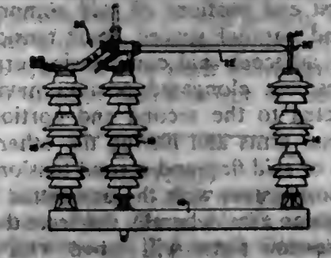
---

2,771,520
ROTARY SWITCH
Arthur Myron Stevens, Middletown, Ohio, assignor to The Barkelew Electric Manufacturing Co., Middletown, Ohio, a corporation of Ohio
Application November 1, 1952, Serial No. 318,208
9 Claims. (Cl. 200—15)

1. In a rotary switch; a panel of insulating material, a plurality of stationary flat contact elements mounted in circumferentially spaced relation on the back side of said panel, a rotary contact arm also on the back side of said panel, adapted for successively engaging said contact elements, said contact arm comprising a pair of elements spaced apart the thickness of a stationary contact in order to receive the contacts in a successive manner as the arm is rotated, the elements of said pair being coincidentally positioned one over the other so as to wipe only one contact at any one time, a shaft supporting said arm and extending through said panel and journalled on said panel, a star wheel carried by the shaft on the front side of said panel, a pair of arms pivoted to spaced points on the front side of said panel, said arms extending beyond the star wheel, a spring interconnecting the free ends of said arms for urging them toward said star wheel, and a roller carried by each arm and engaging the periphery of said star wheel, each of said rollers being annularly grooved and the grooves in the said rollers being of such a width as to receive therein the periphery of the said star wheel.

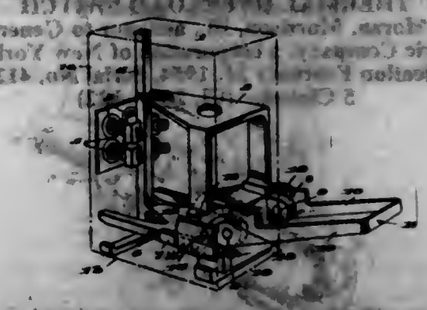
---

2,771,521
REMOTE CONTROL KEY SWITCH
Robert C. Creasman and Earl F. Rollman, Warwick, R. I., assignors to General Electric Company, a corporation of New York
Application November 30, 1954, Serial No. 471,976
2 Claims. (Cl. 200—42)



1. A low voltage momentary-contact key switch comprising a hollow housing with a center contact and one or more side contacts mounted therein, the center contact having an aperture to receive a portion of a key member so that the key may pivot therein to make contact with one or the other of the side contacts, and a centering spring supported in the housing and adapted to hold a key member in a neutral open circuit position when the key is left in the switch, the said centering spring being supported by an anchoring leg from the bottom portion of the housing, while the main portion of the spring encompasses a boss formed as an integral part of the top portion of the housing to provide a pair of spring fingers adapted to engage and resist any turning movement of the key.

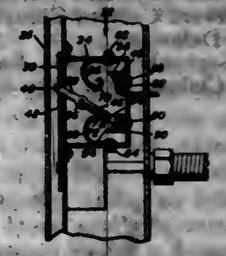
---



2,771,522
DISCONNECTING SWITCH
Peder B. Hoye, Maywood, Ill., assignor to Electrical Engineers Equipment Co., Melrose Park, Ill., a corporation of Illinois
Application May 17, 1955, Serial No. 516,670
6 Claims. (Cl. 200—48)

1. In a disconnecting switch having a switch blade rotatable about its own axis and arcuately movable between two end positions, operating mechanism for the blade comprising a frame, a blade hinge pivotally mounted on the frame, a blade carriage rotatably mounted on the hinge, and a rotatable operating crank operatively connected to the carriage, the pivot axis of said hinge and the axes of rotation of said carriage and said crank in one end position of the blade each being disposed substantially at right angles to the other two axes, one of said axes of rotation substantially intersecting the pivot axis of said hinge and the other being substantially offset from said pivot axis; said carriage including a rigid angular extension and said crank including a complementary extension, said extensions being operatively connected for relative sliding, rotating and swiveling movement.

---

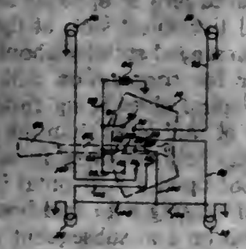


2,771,523
DISCONNECTABLE RELAY APPARATUS
Josef Stocklin, Ennetbaden, and Mario Lura, Baden, Switzerland, assignors to Aktiengesellschaft Brown, Boveri & Cie, Baden, Switzerland, a joint-stock company
Application July 18, 1955, Serial No. 522,646
Claims priority, application Switzerland February 18, 1955
4 Claims. (Cl. 200—50)

1. Disconnectable relay apparatus comprising a casing having a front opening, fixed contact means disposed on the inside of the rear wall of said casing, a relay frame adapted to be slidably inserted in said casing through said front opening, said relay frame including relay contact means at the rear thereof for connection with and disconnection from said fixed contact means, a U-shaped lever, the outer ends of the leg portions of said lever being pivotally mounted on the front portion of said frame on co-axially arranged pivot means for rotation about a horizontal axis and means responsive to pivotal movement of said lever for forcibly moving said relay frame and hence said relay contact means towards or away from said fixed contact means to connect or disconnect said contact means, respectively, depending upon the direction of movement of said lever, last said means including horizontal co-axially placed pins at opposite sides of said casing, and open-ended like spiral slots at the outer leg portions of said lever arranged spirally about the axis of rotation of said lever for cooperation with said pins, the open ends of said spiral slots being further away from the axis of rotation of said lever than the opposite closed ends thereof, said pins being engaged in said slots through the open ends thereof upon a horizontal insertion of said relay frame into said casing with said lever in a substantially horizontal position and subsequent rotation of said lever into a vertical position serving to move said spiral slots along said pins thereby to effect a pulling movement of said lever and relay frame and the contact means at the rear thereof inwardly of said casing for connection with said fixed contact means at the inner side of the vertical rear wall of said casing, rotation of said lever from the vertical position toward the horizontal position serving to move said slots in the opposite direction along said pins thereby pushing said relay frame and retracting said contact means thereon from said fixed contact means.

---

2,771,524
SPEED ALARM
Carl B. Flasher, Los Angeles, Calif.
Application March 30, 1954, Serial No. 419,697
2 Claims. (Cl. 200—56)



1. An actuation device adapted to be used with a hood mounted visual signal device and actuated by the indicator of a speedometer comprising a casing, a switch handle rotatably mounted in said casing and having an end portion extending outwardly of said casing for engagement by the speedometer indicator, a pair of opposed resilient seats in said casing, one of said seats being electrically conductive, and a resilient contact on said switch handle adapted to resiliently engage and seat in one of said seats when said switch handle is actuated by said indicator, and a pair of springs partially overlying said seats and engageable by said switch handle, said springs being stressed to permit said indicator to pass over said switch handle, said springs returning said switch handle into position for subsequent engagement by said indicator.

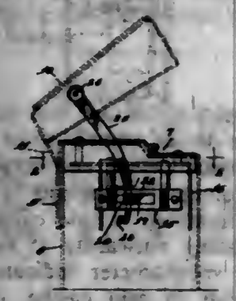
---

2,771,525
SIGNAL DEVICE FOR MOTOR VEHICLES
Morris Sivak, Brooklyn, N. Y.
Application November 19, 1954, Serial No. 469,286
1 Claim. (Cl. 200—61.27)

In a directional and stop signal device for vehicles, switching mechanism including a casing having "left" and "right" sets of contacts adapted to close circuits to the left and right signal lamps respectively of a vehicle when

bridged, an insulating switch handle pivoted in the casing, a conducting sleeve on said handle constituting a bridge adapted to bridge said sets in opposite extreme "left" and "right" positions to which the handle is shifted, a third set of contacts between the first and second sets bridged by the bridge in a third position of the handle and arranged to close a circuit to both the left and right signal lamps of a vehicle simultaneously, and a fourth set of contacts closed by the handle in a fourth position thereof and also arranged to close the circuit to both the left and

right signal lamps simultaneously, the "left" and "right" sets of contacts being disposed in a common horizontal plane, said switch handle being pivoted about a first axis to swing in said plane, the third set of contacts being disposed above said plane, the switch handle being pivoted to swing upwardly in a plane normal to the first plane to bridge said third set of contacts, the fourth set of contacts being disposed below the horizontal plane, said switch handle when swung about the second axis thereof being shiftable downwardly to close said fourth set of contacts.



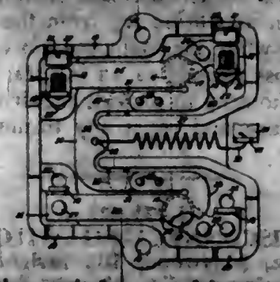
---

2,771,526

## SWITCH ACTUATOR APPARATUS

Carl W. Clarus and Theodore Wickstrom, Chicago, Ill., assignors to Revere Camera Company, Chicago, Ill., a corporation of Delaware

Application September 1, 1954, Serial No. 453,599
5 Claims. (Cl. 200—61.62)



1. In combination, a case, a cover, a hinge between said case and said cover, said hinge providing random-direction movement and dimensionally irregular relation between said cover and said case, a switch mounted within said case, a switch actuator extending laterally from a face of said switch, a fixed element in close proximity to said actutor, said actuator being biased toward said fixed element, a keeper spaced from said switch face and an elongated combination cover stay and switch operator having one end attached to said cover in a pivotal manner, said stay and operator being curvilinear and tapering in width from said one end and having a stop element at the other end, said stay and operator extending through the space bounded by said switch face, said switch actuator, said fixed element and said keeper, whereby longitudinal movement of said stay and operator when said cover is opened and closed is effective, respectively, to close and open said switch.

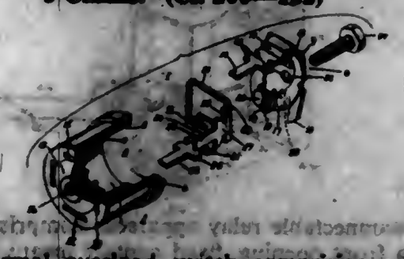
2,771,527

## SNAP ACTION SWITCH

George M. Hausler, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York

Application July 16, 1954, Serial No. 443,523
7 Claims. (Cl. 200—67)

1. A snap action switch comprising a pair of parallel spaced apart elongated compression arms each having opposite first and second end portions which are movable in a transverse direction, relatively rigid means interconnecting the first end portions of said compression arms, first and second parallel spaced apart tension arms disposed laterally adjacent said compression arms and each including a resilient elongated portion having one end flexibly connected to the second end portion of one of said compression arms and having the other end fixedly mounted, each of said first and second tension arms forming a snap action system with the associated flexibly connected compression arm, whereby the second end portions of said compression arms will move with snap action whenever the compression centerline of said compression arms is moved through a position of alignment with the tension centerline of said first and second tension members in response to transverse movement of said interconnecting means, a third elongated tension arm disposed intermediate and in parallel relationship to said compression arms and having one end movable in a transverse direction and the other end pivotally connected to said interconnecting means to form with said compression arms another snap action system, whereby said interconnecting means will move with snap action whenever the tension centerline of said third tension arm is moved through a position of alignment with the compression centerline of said compression arms in response to transverse movement of said one end of said third tension arm, a movable actuating member connected to said one end of said third tension arm and disposed to apply tensile stress to said third tension arm while moving in a transverse path thereby to actuate the snap action systems, a pair of movable switch contacts mounted for movement with the second end portions of said compression arms, and a pair of stationary switch contacts fixedly mounted in cooperating relationship with said movable switch contacts.



---

2,771,528

## THERMAL OVERLOAD SWITCH

Don E. Moran, Morrison, Ill., assignor to General Electric Company, a corporation of New York

Application February 25, 1954, Serial No. 412,468
5 Claims. (Cl. 200—122)

1. A thermal overload switch comprising a housing member of insulating material having a cavity formed therein, a metallic mounting member positioned in said cavity spaced from the bottom thereof and extending

substantially across the same, said mounting member having a portion extending through said housing member bottom to form an external terminal, a bimetallic element in said cavity intermediate said housing member bottom and said mounting member and having a point thereon secured to said mounting member adjacent one end thereof, a movable contact mounted on said bimetallic element opposite from said point and facing said housing member bottom, a terminal member having one end in said cavity and extending through said housing member bottom to form a second external terminal, a stationary contact mounted on said one end of said terminal member and cooperating with said movable contact, another terminal member having one end in said cavity and extending through said housing member bottom to form a third external terminal, a heater positioned in said cavity and having its ends respectively connected to said one end of said terminal members, said mounting member being normally longitudinally bowed away from said housing member bottom, and means for selectively deflecting said mounting member toward said bottom thereby to set one characteristic of said switch, said mounting member having a portion extending toward said bimetallic element and adapted to limit movement of the same thereby to set another characteristic of said switch.

---

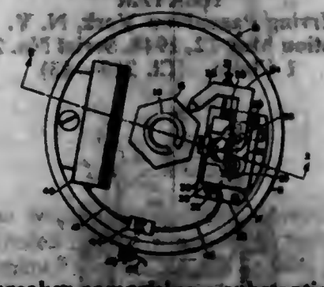
2,771,529

## COAXIAL LINE SWITCH

John A. Kostrisa, New Dorp, N. Y., assignor to International Telephone and Telegraph Corporation, Nutley, N. J., a corporation of Maryland

Application March 29, 1954, Serial No. 419,267
1 Claim. (Cl. 200—153)

A coaxial electric switch comprising inner and outer conductors, said inner conductor having a section movable radially to break conduction along said inner conductor while maintaining said outer conductor stationary, a bead of dielectric material disposed in said outer conductor to support said inner conductor axially thereof, said bead having a recess in one side thereof to receive said section, said outer conductor having an opening therethrough in alignment with said recess, and means extending through said opening for moving said section radially out of alignment with said inner conductor and into said recess.



---

2,771,530

## CIRCUIT BREAKER

Louis P. Trombetta, Miami, Fla.

Application February 9, 1953, Serial No. 335,717
1 Claim. (Cl. 200—166)

A circuit breaker comprising a substantially rectangular housing, a chamber in said housing, said chamber forming an opening in at least two sides of said housing, a spherical member contained in said chamber, a pair of roller members pivotally mounted within said chamber, a spring

having one end secured to said housing and its other end extending across one of said openings yieldingly urging said spherical member into contact with said roller members, an operating lever extending through said other opening in said housing to a position adjacent said spherical member, and pivot means mounting said operating lever whereby upon the pivotal movement of said operating lever said spherical member is moved out of contact engagement with said rollers while substantially simultaneously effecting a rotational movement of said spherical and roller members.

---

2,771,531

## ELECTRIC SWITCH CONTACT CONSTRUCTION

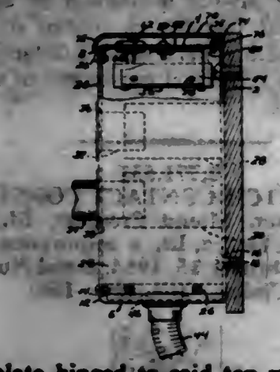
Wilhelm A. Strauss, Mount Prospect, Ill., assignor to Oak Mfg. Co., Chicago, Ill., a corporation of Illinois

Application February 15, 1954, Serial No. 410,355
2 Claims. (Cl. 200—166)

1. A multi-contact switch construction for television turret tuners or the like comprising a stator carrying at least one elongated insulating stator strip with a plurality of contacts rigidly secured thereon, said contacts being disposed in side-by-side relation along the length of said strip, a rotor carrying a plurality of elongated rotor strips, said rotor axis, stator strip and rotor strips being parallel, the rotor strips being movable with rotor movement past the stator strip, each rotor strip carrying a plurality of rotor contacts rigidly secured thereto, each rotor contact having a cooperating stator contact, a pair of cooperating rotor and stator contacts having the following construction: one of said cooperating contacts having as the active part a blade whose plane should be perpendicular to the rotor axis, the other cooperating contact having a pair of spring jaws extending toward the blade contact when a pair of contacts are in circuit-closing condition, the blade and jaws cooperating so that the leading edge of the blade is a side edge and the cooperating jaw edges are also side edges, said jaw side edges being flared away from each other so that the blade may enter properly, said jaws being springable to separate when said blade enters between said jaws, the other cooperating contact having a mounting portion for securing to the insulating strip and having in intermediate portion between each jaw and mounting portion, the intermediate portion for one jaw being apertured and the intermediate portion for the other jaw having a tongue cut out therefrom and extending through the aperture of the one jaw with the tongue bent over to lock the two jaws together, said jaws extending substantially straight from their intermediate portions, the tongue and aperture for the jaw contacts being substantially midway between the sides of each jaw portion, said contacts during assembly being susceptible to misalignment whereby any blade entering between the open jaw tips of a cooperating contact even though out of alignment will finally make firm contact between the contact-making portions of the jaws, the tongue and slot arrangement serving to maintain the jaws together, said blades and jaws being free for accommodation.

---

2,771,532

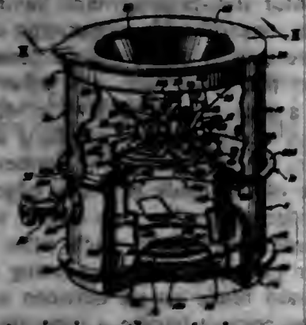


## SAFETY SWITCH ASSEMBLY

Louis M. Bellis, East Boston, Mass.

Application June 24, 1954, Serial No. 439,088
3 Claims. (Cl. 200—168)

1. A switch assembly comprising a switch box defined by front, back, top, bottom and side walls, two switches



mounted within said box, one of said switches being normally open and the other of said switches being normally closed, said normally open switch having an actuating button extending through an opening in said front wall, said normally closed switch having a spring-loaded actuating member extending through an opening in said top

wall, and a plate hinged to said top wall and overlying said actuating member, said plate when depressed acting to open said normally closed switch, said actuating button and said hinged plate being sufficiently proximate each other to be simultaneously actuated by the thumb and one of the fingers of a human hand.

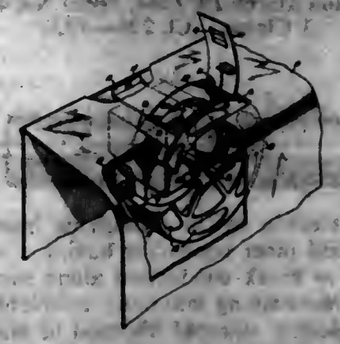
---

2,771,533
**WASTE DISPOSAL DEVICE**
Chester F. Ostberg, San Diego, Calif., and Clifford B. Cooper, Fort Worth, Tex., assignors, by mesne assignments, to General Dynamics Corporation, a corporation of Delaware
Application September 3, 1953, Serial No. 378,362
17 Claims. (Cl. 219—19)

11. A waste incinerating device comprising a first receptacle for receiving waste, said first receptacle having an inlet opening and an outlet opening, a second receptacle having an opening communicating with said outlet opening of said first receptacle, means within said second receptacle for incinerating waste, a first door means adapted for normally closing said outlet opening of said first receptacle whereby waste may be accepted within said first receptacle, a second door means arranged in the plane of and normally biased to sealing relation with said opening of said second receptacle, actuable means for moving both said first door means and said second door means to an open position whereby the waste passes from a position in said first receptacle to said second receptacle, and exhaust means associated with said second receptacle for ejecting incinerated waste products therefrom.

---

2,771,534
**ROTATING NYLON BELT CUTTER**
Joseph L. Schwaiss, Philadelphia, Pa.
Application July 19, 1955, Serial No. 523,131
1 Claim. (Cl. 219—29)
(Granted under Title 35, U. S. Code (1952), sec. 266)



A cutting device for cutting a synthetic belting material in specified lengths comprising a pair of closely spaced drums mounted on separate shafts, means to rotate one of said drums, synchronizing meshing gear means mounted on said shafts to thereby rotate the drums at the same speed, a plurality of longitudinal wells set into the periphery of one of the drums, a similar plurality of mating longitudinal wells set into the periphery of the other of said drums, a heating wire mounted in each of the wells of the one of said drums, a set of copper end plates

mounted on the ends of the one of said drums, said plates connected to an electrical source and to the terminals of said wires, a plurality of pins mounted on the periphery of the other of said drums, rotation of said drums causing said belting to pass between the drums with the pins engaging said belting and aiding the drums to pass said belting between the drums and said wire heated by the electrical current passed therethrough cutting and fusing the belting on its travel through the drums.

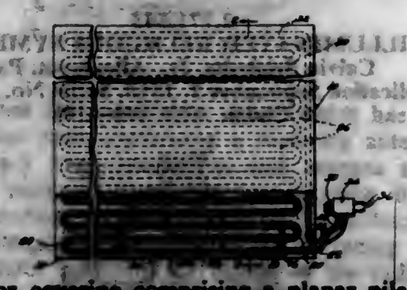
---

2,771,535
**ROTARY SWITCH**
Donald G. Kimball, Stratford, Conn., assignor to General Electric Company, a corporation of New York
Application November 19, 1954, Serial No. 469,593
6 Claims. (Cl. 219—37)

2. An electric switch assembly comprising a rotary switch having a rotatable control shaft projecting outwardly therefrom, a control drum mounted on said control shaft, a pilot lamp socket fixedly positioned with respect to said rotary switch on the interior of said control drum, and an access door in the periphery of said control drum, said access door providing an opening to the interior of said drum for removing and replacing the pilot lamp mounted in said socket.

---

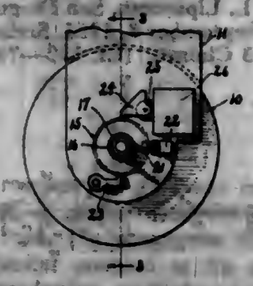
2,771,536
**AUTOMATIC PRESSURE COOKER AND ELECTRIC HEATER**
Irving Page, New York, N. Y.
Application May 22, 1948, Serial No. 28,627
1 Claim. (Cl. 219—43)



1. In a pressure cooker having a heating pot into which it rests and an electric heater, a removable pressure tight

cover having electric control means secured thereto, wires and contact terminals secured to said cover, connected to said electric control means and said heater removable with said cover, a stand secured to said cooker having contact terminals disposed vertically in its top for breaking the circuit to said control means and for mating with said terminals secured to said cover and for supplying electric current to said control means, said contact terminals being electrically disconnected and separable by raising said cooker from said heating pot and by raising said cover, as when removed from said cooker.

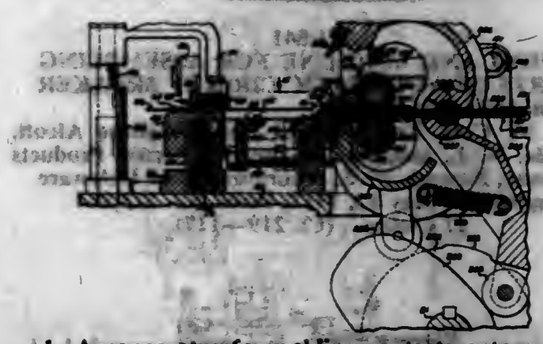
---



2,771,537
**THERMAL FLOOR COVERING**
Morris D. Lichtenstein, Chicago, Ill.
Application June 4, 1954, Serial No. 434,469
2 Claims. (Cl. 219—46)

1. A floor covering comprising a planar pile surface portion, a fabric backing supporting said pile surface portion, a resilient base element secured to said fabric backing, a heating element disposed within said floor covering, said heating element comprising two elongated electrical resistance elements following side by side tortuous paths whereby the area of said planar surface is subdivided into a plurality of small uniform areas, flexible conductor means extending from each of said resistance elements, and switch means terminating said flexible conductors, said switch means comprising a housing, a plurality of wall socket engaging prongs extending from said housing, and a movable switch element mounted in said housing to selectively connect one of said resistance elements to said prongs, both of said elements to said prongs in series, or both of said resistance elements in parallel relationship.

---



2,771,538
**WELDING APPARATUS**
Arthur L. Williams, Warren, Ohio, assignor to The Federal Machine and Welder Company, Warren, Ohio, a corporation of Ohio
Application June 16, 1953, Serial No. 362,069
12 Claims. (Cl. 219—78)

1. A seam welder construction, comprising a support, a shaft journaled in said support for both rotational and axial movement, a weld wheel fixedly secured to said shaft and movable therewith, means having a cam-like surface carried by said shaft and movable axially therewith, said means and said shaft being rotatable relative to one another, follower means secured to said support and engageable with said cam-like surface, and means for selectively rotating the means having a cam-like surface for shifting said shaft in an axial direction to distribute wear evenly across the face of said wheel.

2,771,539
**APPARATUS FOR WELDING CONTACTS ONTO WIRE SPRING RELAYS**
Hubert A. Myers, Los Angeles, Calif., assignor to Western Electric Company, Incorporated, New York, N. Y., a corporation of New York
Application October 19, 1953, Serial No. 386,742
23 Claims. (Cl. 219—79)

1. An apparatus for welding contacts onto a plurality of springs of a relay part comprising a pair of welding stations, feed means for intermittently moving relay parts successively to and from said welding stations, means at said welding stations for positioning the relay part and the springs thereon in a predetermined position at said stations, means at said welding stations for feeding a plurality of contact tapes onto the ends of one set of alternate springs of the said relay part in one of said stations and onto the ends of the other set of alternate springs of the relay part in the other station, means at said welding stations for welding the ends of the tapes to the ends of said springs, and means for severing the welded ends of the tapes from the tapes to form the contacts on the springs.

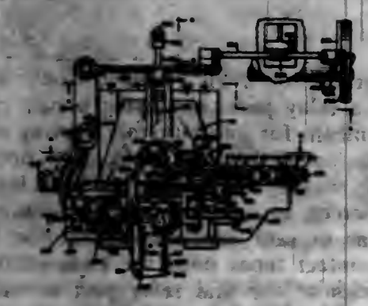
2,771,540
**SOLDERING TRANSFORMER FOR SPLICING COAXIAL CABLES**
Ray H. Dittmore, Milwaukee, Walther Richter, Whitefish Bay, Daniel Shadd and James A. McMillan, Milwaukee, and Russell W. Trichle, Jr., Janesville, Wis., assignors to Dittmore-Prudworth Corp., Milwaukee, Wis., a corporation of Wisconsin
Original application June 28, 1954, Serial No. 439,752. Divided and this application February 1, 1955, Serial No. 485,004
6 Claims. (Cl. 219—85)

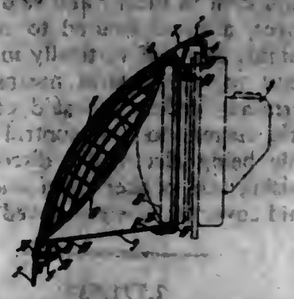


1. In a transformer for use in soldering the abutting ends of conductors in axially alined lengths of electrical or electronic cable with the insulating sheaths on the conductors extending close to the ends of the latter, the combination of a portable body containing a primary winding, a split secondary winding associated with the latter and including a first pair of substantially parallel terminal arms and a second pair of substantially parallel terminal arms, the arms of the two pairs being in laterally opposed relation and all of said arms projecting out of the body and being resiliently yieldable in lateral direc-

tions at right angles to each other, a conductor clamping jaw at the outer extremity of each of said arms, said jaws being arranged in coacting pairs to grip the alined conductors between them, one pair of jaws being on each of the opposed arms of said first and second pairs, separate adjustable means between the laterally opposed arms of said first and second pairs to move the coacting jaws into gripping engagement with alined conductor ends, and spring means associated with the intermediate portions of all of said arms to bias the pairs of jaws toward each other to hold the gripped conductor ends in contact.

---

**2,771,541**
**METHOD AND MACHINE FOR ASSEMBLING PARTS OF AUTOMATIC CIRCUIT BREAKER SUB-ASSEMBLIES**
Herbert M. Cole, Teaneck, and David Wallace Alcott, Hillside, N. J., assignors to Federal Electric Products Company, Newark, N. J., a corporation of Delaware
Application May 12, 1951, Serial No. 225,954
17 Claims. (Cl. 219—117)



10. The method of making subassemblies for circuit breakers or the like, each subassembly having two metal parts of different forms united to a piece of flexible metallic braid and with said parts separated from each other by a connecting length of said braid, said method including the steps of uniting a series of metal parts of one of said forms to a continuous length of flexible metallic braid at intervals long enough to provide each said united part with a said connecting length of braid and the thus united metal parts and braid constituting a supply of units each including one of said united parts and a connecting length of braid, mechanically feeding said supply of units successively to a uniting device, mechanically presenting a series of metal parts of the second form individually and sequentially to said uniting device, operating said uniting device to unite each of said second form of parts to each respective unit of said supply at a point spaced by said connecting length of braid from the first form of part previously united thereto, and cutting each said unit from said supply of units.

---

**2,771,542**
**HEADLAMP AND DOOR ASSEMBLY**
Harley J. Earl, Grosse Pointe Farms, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application December 8, 1953, Serial No. 396,943
6 Claims. (Cl. 240—8.1)

1. A headlamp door assembly adapted for use with a standard sealed beam headlamp mounted within an aperture in the streamlined body of a vehicle comprising a tubular spacer element obliquely truncated on its outer end and adapted to conceal the headlamp mounting and adjusting structure, a groove formed on the inner end of said spacer, a resilient sealing gasket positioned in said groove for establishing a weatherseal with the headlamp, a finish ring adapted to blend-in flush with the vehicle surface about the headlamp aperture, the outer end of said spacer being secured to the inner surface of said ring, and means secured to the upper portion of the assembly for supporting the assembly in the aperture,

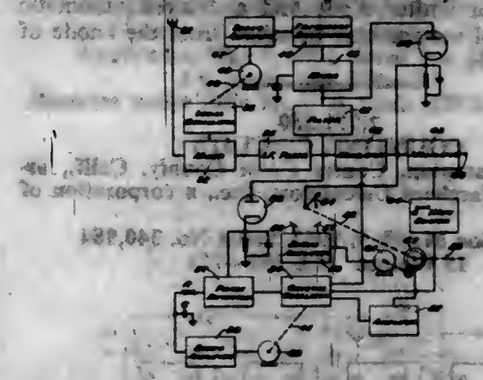
the assembly being adapted to be removably secured within the aperture.

---

**2,771,543**
**ILLUMINATED RELIGIOUS SYMBOL**
Calvin Seidholtz, Jr., Allentown, Pa.
Application September 2, 1953, Serial No. 378,156
1 Claim. (Cl. 240—10)

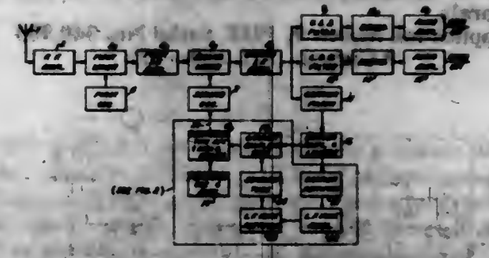
A lamp including a standard of translucent material and of generally cruciform configuration, the meeting edges of the faces of said standard being rounded to permit uninterrupted refraction of light therethrough, the surface area of said faces being provided with contiguous frusto-pyramidal projections permitting interrupted transmission of light therethrough, a hollow base connected to said standard, said base including a continuous depending skirt and a substantially centrally located dome-shaped interior surface, the upper outer surface of said base comprising a plurality of stepped surfaces of progressively reduced surface areas, a bracket mounted within said base upon an inner surface of said depending skirt, a source of illumination carried by said bracket and positioned to direct light rays upwardly against said dome-shaped surface to illuminate said standard, a reflecting cover plate below said hollow base, and a ventilating aperture located in one wall of said depending skirt and providing communication between said hollow base and the outer atmosphere.

---



**2,771,544**
**COLLAPSIBLE CONCENTRIC RING LUMINAIRE**
Willis L. Lipscomb, San Diego, Calif.
Application September 8, 1953, Serial No. 378,799
3 Claims. (Cl. 240—78)

1. In a luminaire comprising a hanger-supported member, a plurality of horizontally spaced light-shielding rings concentric with said member and a plurality of sets of flexible linear elements suspending said rings from said member, each linear element of each set being secured to only one ring, said elements being removable from said member, and removable retainer elements securing said linear elements to said rings, said rings being collapsible within the confines of the largest ring.

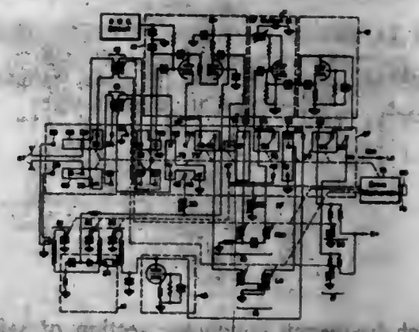


**2,771,545**
**MULTIPLE FREQUENCY COMMUNICATION SYSTEM**
Melvin L. Doolo, Glendale, Calif., assignor to Collins Radio Company, Cedar Rapids, Iowa, a corporation of Iowa
Application November 3, 1951, Serial No. 254,756
4 Claims. (Cl. 250—5)

2. A receiver for receiving a signal which has a low signal to noise ratio comprising a receiving antenna, a radio frequency stage attached to said antenna and receiving said incoming signal and heterodyning it down to an intermediate frequency, a crystal oscillator synchronized with the modulation of the incoming signal, a first modulator receiving the output of the radio frequency stage, said first modulator receiving an input from said crystal oscillator which has a shape fulfilling the mathematical function of cosine squared and modulating the output of the radio frequency stage, a wave shaper receiving an input from said crystal oscillator and producing an output which has a shape fulfilling the mathematical function of an exponential curve, a second modulator receiving the output of the first modulator and the output of said wave shaper and modulating the signal with the wave of exponential shape, a plurality of mechanical resonators each tuned to a different frequency receiving the output of said second modulator, and resolving means connected to the mechanical resonators to determine which one of them is energized.

---

**2,771,546**
**SQUELCH CIRCUIT**
Robert Eldon Schock, Riverhead, N. Y., assignor to Radio Corporation of America, a corporation of Delaware
Application August 16, 1955, Serial No. 527,587
14 Claims. (Cl. 250—20)



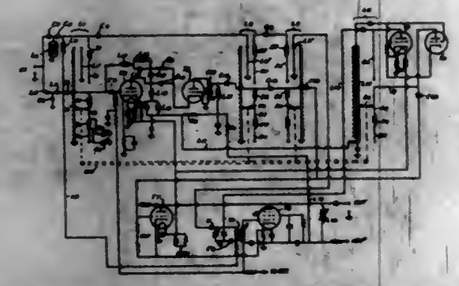
1. In a receiver receptive of sideband intelligence and also a carrier signal, a carrier filter for separating out the carrier signal from the composite received signal, an amplifier and limiter coupled to the output of said filter, a local heterodyning oscillator in said receiver for determining the frequency of said separated carrier signal, an automatic frequency control circuit coupled to the output of said amplifier and limiter and normally operating to maintain the frequency of said oscillator at a value such that said separated carrier signal has substantially a predetermined frequency, and means responsive to variations in the amplitude level of the separated, amplified, and limited carrier signal for opening

the coupling between said frequency control circuit and the amplifier and limiter output, thereby rendering ineffective said frequency control circuit.

---

**2,771,547**
**MULTIBAND FREQUENCY SELECTOR AND FREQUENCY CONVERTER**
John F. Bell, Glenview, and Roger M. Nordby, Evanston, Ill., assignors to Zenith Radio Corporation, a corporation of Illinois
Application August 5, 1955, Serial No. 526,710
8 Claims. (Cl. 250—20)

1. A frequency-selective device for tuning a television receiver to each of a plurality of different frequency channels located within a low frequency range, a middle frequency range, and a high frequency range, said device comprising: an electrical signal-translating network including an amplifier, a first oscillator, a first mixer circuit, a second oscillator, and a second mixer circuit; first tunable circuit means for adjusting said amplifier, said first oscillator, and said first mixer for operation within said low frequency range; second tunable circuit means for adjusting said amplifier, said first oscillator, and said first mixer for operation within said middle frequency range; third tunable circuit means for adjusting said second oscillator and said second mixer for operation within said high frequency range and for adjusting said amplifier and said first mixer for operation as amplifiers at a predetermined intermediate frequency; switching means for selectively individually intercoupling said tunable circuit means with said signal-translating network; and a unicontrol mechanism, operated by continuous rotation of a single shaft, for actuating said switch means and for tuning each of said tunable circuit means in predetermined sequence to condition said signal-translating network for operation throughout said three frequency ranges.



8. In a frequency selective apparatus for tuning a television receiver to any of a plurality of different frequency channels located within a predetermined frequency range, a heterodyning stage comprising: an oscillator circuit, including a pair of output terminals; a mixer circuit, including an asymmetrically conductive device and an output lead coupled to said device; and coupling means for electrically coupling said oscillator circuit to said mixer circuit, said coupling means comprising a conductive feed-through capacitor member encompassing a predetermined portion of said output lead of said mixer circuit, the opposite ends of said feed-through capacitor member being individually coupled to respective output terminals of said oscillator.

---

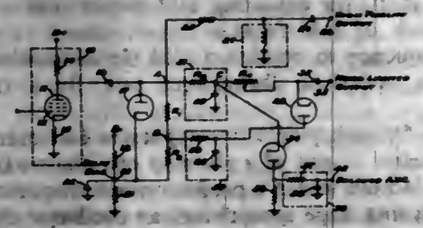
**2,771,548**
**RECEIVER TUNABLE OVER V. H. F. AND U. H. F. TELEVISION BANDS**
Sid Deutsch, Brooklyn, N. Y., assignor to Polytechnic Research & Development Co., Inc., Brooklyn, N. Y., a corporation of New York
Application July 8, 1952, Serial No. 297,706
11 Claims. (Cl. 250—20)

5. A receiver for short radio waves comprising a shielded transmission line having a short-circuiting slider

movable throughout the length thereof, the transmission conductor of said line being divided into two linear sections comprising a low-frequency section and a high-frequency section, means for applying received waves to each of said conductor sections, an output circuit, detector circuits connecting said conductor sections to said output circuit, a second shielded transmission line having a short-circuiting slider movable throughout the length thereof and having its transmission conductor divided into two linear sections comprising a low-frequency section and a high-frequency section, means connecting said sliders for ganged operation, an electronic tube connected

to the high-frequency conductor section of said second transmission line and producing oscillations of a frequency determined by the length of the high-frequency conductor section of the second line, a second electronic tube connected with the low-frequency conductor section of the second line and producing oscillations of a frequency determined by the length of the connected low-frequency conductor section, connections for supplying oscillations from said electronic tubes to the respective detector circuits, and connections for selectively supplying anode current to said electronic tubes through the short-circuiting slider of said second transmission line.

---



2,771,549

**SIGNAL RECEIVING CIRCUIT**

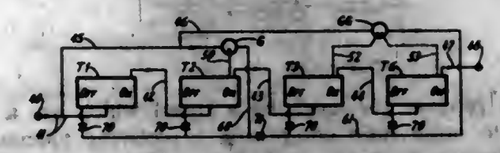
Domenick P. Viteral, Cedar Rapids, Iowa, assignor to Collins Radio Company, Cedar Rapids, Iowa, a corporation of Iowa

Application February 10, 1955, Serial No. 487,387

3 Claims. (Cl. 250—20)

1. A receiving circuit connected to a source of modulated radio-frequency energy providing an output with one side grounded, the circuit comprising, a charging capacitor having one side connected to the ungrounded side of said signal output, a detector diode having its anode connected to the other side of the charging capacitor, a pair of resistors connected in series across the detector diode, a B plus source, a voltage divider connected between the B plus source and ground, the cathode of the detector diode connected to an intermediate point on the divider, a third resistor with one end connected to the point common to the pair of resistors, a noise limiter diode with its anode connected to the other end of the third resistor, a second capacitor connected between ground and the anode of the limiter diode to provide a low pass filter with the third resistor having a cut-off frequency above the modulation frequency, a second pair of resistors connected between the anode of the detector diode and the cathode of the limiter diode, a third capacitor connected between ground and the common point of the second pair of resistors to comprise a modulation blocking low pass filter with the resistor connected to the detector diode, a delay diode having its cathode connected to the ungrounded side of said third capacitor, and another resistor connected serially between ground and the anode of the delay diode, whereby a noise limited signal may be taken from the cathode of the limiter diode and a delayed automatic volume control voltage may be taken from the anode of the delay diode.

---



2,771,550

**COUNTING CIRCUITS**

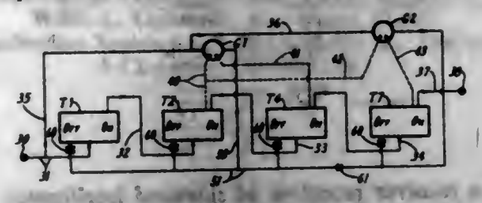
Robert W. Hampton, Contra Costa County, Calif., assignor to Marchant Calculators, Inc., a corporation of California

Application March 9, 1953, Serial No. 340,984

15 Claims. (Cl. 250—27)

1. The combination of: four stages of circuitry, each stage having a first and a second stable condition of operation and each stage being initially in its first condition of operation; means for applying input signals to the first stage; means interconnecting said stages for setting a respective unique combination of said stages to their respective second conditions of operation in response to each number, 0–9, of applied signals; a circuit, including said interconnecting means, for preventing more than two of said stages from standing in their respective second conditions of operation in response to the application of any number, 0–9, of input signals to said first stage; a circuit, including said interconnecting means, for establishing a permanent relationship between the second condition of operation of each of said stages and a single number of input signals; and a reset circuit comprising normally disabled means connected to the third and fourth stages and controlled thereby, when the third and fourth stages are concurrently in respective predetermined conditions of operation, for resetting all four stages to their respective first conditions of operation.

---



2,771,551

**COUNTING CIRCUITS**

Robert W. Hampton, Contra Costa County, Calif., assignor to Marchant Calculators, Inc., a corporation of California

Application March 9, 1953, Serial No. 340,983

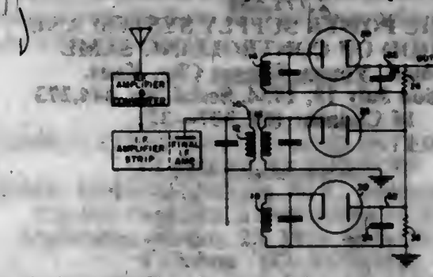
9 Claims. (Cl. 250—27)

1. In a counting circuit, the combination of: first, second, third and fourth counting stages, each stage having a first and a second stable state of operation and each stage being initially in its first state; an input pulse source connected to the first stage; means coupling the stages in cascade and operable in response to the input pulses for causing the stages to alternate between their two states in binary progression; a modifying circuit, including said coupling means, for preventing more than two of said stages from standing in their respective second states of operation in response to the application of any single number, 0–9, of input pulses to said first stage; and a

circuit, including said modifying circuit, for establishing a permanent relationship between the second state of operation of each of said stages and the application of 1, 2, 4 and 7 input pulses, respectively, to said first stage.

---

2,771,552



**DISCRIMINATING DETECTOR**

Donald W. Lynch, Washington, D. C.

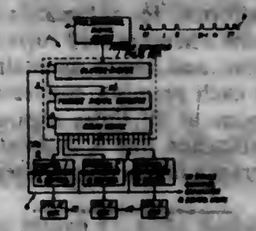
Application May 9, 1951, Serial No. 225,437

3 Claims. (Cl. 250—27)

(Granted under Title 35, U. S. Code (1952), sec. 266)

1. A detector circuit comprising in combination, a first detector channel operative to provide demodulated output signals of one polarity, second and third detector channels operative to provide demodulated output signals of a polarity opposite to the polarity of the output of said first detector channel, each of said detector channels having a predetermined bandpass; said second and third detector channels having bandpass center frequencies within the bandpass of said first detector channel and at the high and low ends thereof respectively, the bandpass of each of said second and third detector channels being less than one half the bandpass of said first detector channel, and means combining the outputs of said detector channels whereby the resultant demodulated output of all of said channels is the algebraic sum of the individual outputs of said detector channels.

---



2,771,553

**MULTIPLEX DEMODULATOR**

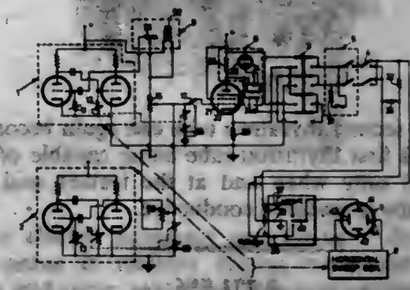
Sidney Metzger, Bergenfield, Robert W. Hughes, Mountain Lakes, and Bruce McAdams, North Arlington, N. J., assignors to International Telephone and Telegraph Corporation, a corporation of Maryland

Application November 3, 1952, Serial No. 318,456

4 Claims. (Cl. 250—27)

1. In a multiplex pulse communication system wherein a marker signal is followed by a train of interleaved time modulated channel pulses; detector means to detect said marker signal, means responsive to said detected marker signal to produce a plurality of differently timed gating pulses each synchronized for the time modulated pulses of a different channel, a plurality of blocking oscillator circuits each having a first and second conduction condition to separate from and demodulate the corresponding channel pulses of said train of pulses, means including an RC time constant network to normally maintain each of said oscillator circuits at said first conduction condition for a time interval greater than the time interval between successive pulses of each channel, means to apply the gating pulses to respective ones of said oscillator circuits to trigger said oscillator circuits into said second conduction condition to establish a substantially constant time positioned leading edge for corresponding channel width modulated output pulses, means to apply the said train of pulses to each of said oscillator circuits, the pulses of the corresponding channel returning said oscillator to said first conduction condition to establish the trailing edge for said width modulated output pulses in accordance with the time modulated condition of the pulses of said corresponding channel, and extraction means coupled to the output of each of said oscillator circuits for direct removal of the audio intelligence from said width modulated output pulses.

---



2,771,554

**IMPULSE GENERATOR FOR MEDICAL USE**

Kurt Gratzl, Vienna, Austria

Application April 11, 1950, Serial No. 155,154

18 Claims. (Cl. 250—27)

1. In a therapeutic apparatus for the generation if electrical impulses, in combination, an input stage comprising a source of impulses, an output stage comprising an electronic device having a cathode, a grid and a plate, circuit means for applying said impulses to said grid, control means for varying the amplitude of said impulses, a load circuit having a pair of terminals for transmitting impulses from said output stage to the body of a patient, said load circuit including a first and a second resistance connected, respectively, to said cathode and to said plate, and switch-over means inserted between said load circuit and said electronic device for selectively connecting the latter across said load circuit as a constant-current device or as a constant-voltage device, said switch-over means having a first position short-circuiting said first resistance while connecting said terminals across said second resistance and a second position short-circuiting said second resistance while connecting said terminals across said first resistance, said first resistance being small and said second resistance being large compared to the body resistance of the patient.

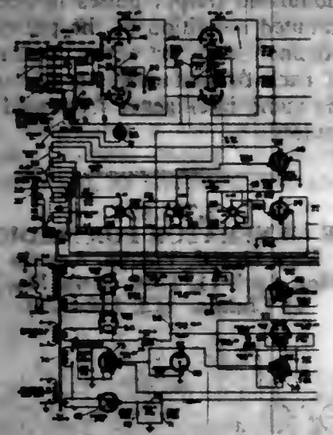
2,771,585

**APPARATUS FOR INDICATING AND/OR RECORDING PRESSURE CONDITIONS**

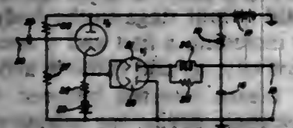


Maurice W. Harrell, Detroit, Mich., assignor to Aeroquip Corporation, Jackson, Mich., a corporation of Michigan

Continuation of application Serial No. 787,586, November 22, 1947. This application October 9, 1951, Serial No. 250,541

3 Claims. (Cl. 250—27)

1. In electrical oscilloscope voltage measuring and indicating apparatus comprising a time base generator direct coupled to a push-pull amplifier and in which the time base generator includes a thyratron tube and a resistance capacity charging circuit, a triggering circuit for controlling the operation of the time base generator, said triggering circuit comprising a second thyratron tube and a selector switch, said selector switch including contacts connected with the grid and the cathode of the first and the second thyratron tubes, respectively, and including an adjustable contactor for electrically connecting said contacts, a re-set switch included in the anode circuit of said second thyratron tube for rendering said second tube non-conductive, said first thyratron tube being then incapable of receiving a signal, means for applying negative



bias to the grid of the second thyratron tube, said bias being effective to maintain said second thyratron tube non-conductive when said re-set switch is again closed, and means for rendering said negative grid bias ineffective

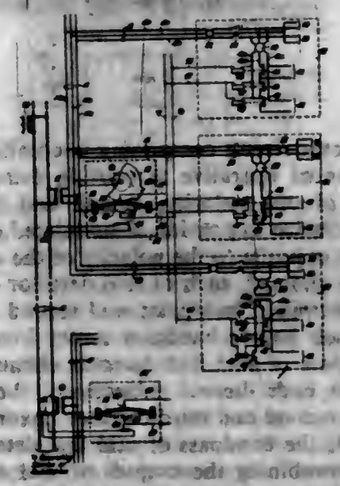
so that said second thyratron tube can again become conductive, said first thyratron tube being capable of receiving a signal only when and at the instant said second thyratron tube is rendered conductive.

---

2,771,556
SAW-TOOTH GENERATOR
William A. Anderson, Middletown, and Charles W. Harrison, Gillette, N. J., assignors to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application December 31, 1953, Serial No. 401,528
5 Claims. (Cl. 250—36)

4. A saw-tooth wave generator comprising a constant potential source having a positive terminal and a negative terminal, a charging condenser, means for connecting one plate of said condenser to said positive terminal and the other plate of said condenser to said negative terminal for charging said condenser at a constant rate, and means responsive to an external source of signals for discharging said condenser at a sinusoidal rate, said means comprising an inductor, an asymmetrically conducting device and a resistance connected in series between said one plate and the negative terminal of said source, and a low impedance signal generator connected in series between said asymmetrically conducting device and said positive terminal for causing said asymmetrically conducting device to conduct whereby said charging condenser is discharged.

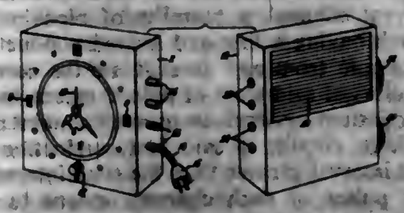
---



2,771,557
COLOR TELEVISION SYNCHRONIZATION
Edward S. Rogers, Trenton, and Reginald A. Hackley, Princeton, N. J., assignors to Radio Corporation of America, a corporation of Delaware
Application February 5, 1953, Serial No. 335,286
8 Claims. (Cl. 250—36)

3. Apparatus for controlling the frequency of an oscillator whose output is compared in phase with a reference frequency signal to derive a controlling voltage which is applied to a reactance tube across said oscillator, comprising means coupled to said oscillator for preventing the phase comparison of said reference signal and the output of said oscillator in response to a deviation of said oscillator of more than a predetermined number of cycles from its resonant frequency, and means adapted to control said reactance tube in response to said frequency deviation of said oscillator.

---

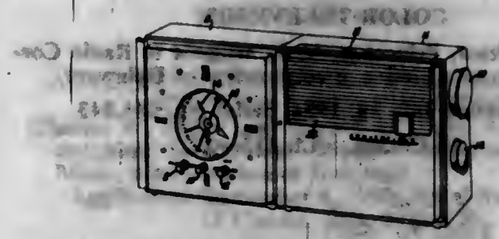


2,771,558
ELECTRIC POWER SUPPLY SYSTEM AND METHOD OF CONTROLLING SAME
Glenn S. Young, Kansas City, Kans.
Application July 19, 1954, Serial No. 444,273
16 Claims. (Cl. 307—35)

13. In a distribution system for supplying electric power to utilization equipment at different consumers' premises, a common feeder having branch lines extending to the different consumers' premises, a main feeder, a transformer connecting said common feeder to said main feeder for receiving power therefrom, each premises having thereat a primary utilization line, at least one of said premises also having a secondary utilization line normally connected to the branch line at that premises but having means operable to disconnect same therefrom, current sensitive means controlled in accordance with the magnitude of the current flowing in said main feeder at a point ahead of said transformer for automatically operating said disconnecting means whenever said current flow exceeds a predetermined value, and means maintaining the primary utilization line at each premises connected to the branch line at that premises at all times regardless of whether said secondary utilization line is connected to or disconnected from the branch line at its premises.

---

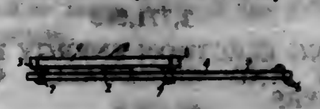
2,771,559
PORTABLE CLOCK RADIO
Richard Montanari, Syracuse, N. Y., assignor to General Electric Company, a corporation of New York
Application January 25, 1956, Serial No. 561,196
7 Claims. (Cl. 307—154)



7. A clock-receiver combination comprising: a first housing, an electric clock mounted in said first housing, a power-supply device mounted in said first housing and adapted to develop operating potentials for a receiver,

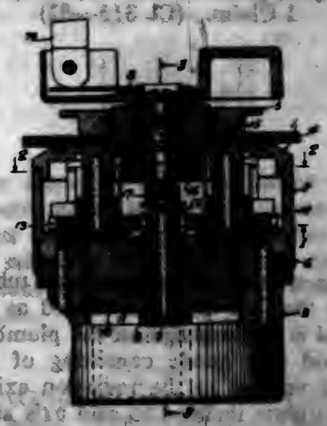
conductors coupling potentials to said clock and to said power-supply device, a switch interposed in a conductor leading to said power-supply device, said switch being connected to said clock whereby said clock may actuate said switch at predetermined times and permit operation of said power-supply device; a second housing, a receiver mounted in said second housing, a circuit in said second housing adapted to furnish operating potentials for said receiver from a battery power-supply or from said power-supply device; and cooperating means on said first and said second housings whereby they may be selectively joined to one another and the receiver operating potentials from said power-supply device may be coupled to said circuit.

---



2,771,560
COMBINATION SWITCH AND INTERLOCK FOR ELECTRICAL DEVICES
Lyle P. Cretsman, Syracuse, N. Y., assignor to General Electric Company, a corporation of New York
Application January 25, 1956, Serial No. 561,195
6 Claims. (Cl. 307—156)

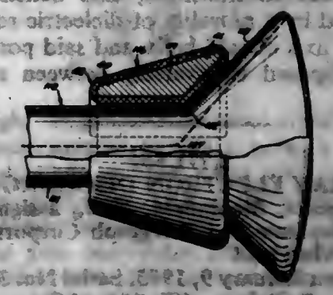
4. A clock-receiver combination comprising a self-contained clock unit including a power supply, a self-contained receiver unit including a battery power supply unit; means for releasably attaching said units to one another, said means including a plate slidably mounted in said receiver unit, said clock unit having an opening provided therein, said opening being disposed adjacent said receiver unit when said units are to be attached, said plate being slidable through said opening into said clock unit, movable latch means in clock unit engageable with said plate when said units are attached, connectors in said receiver unit to couple operating potential thereto, busses on said plate engageable with said connectors and said clock unit power supply when said units are assembled and engageable with said connectors and said battery power supply when said units are not assembled.



---

2,771,561
QUARTZ CRYSTAL UNITS
Dennis Quintrell Feller, Cambridge, England, assignor to Pye Limited, Cambridge, England, a British company
Application March 17, 1952, Serial No. 276,900
4 Claims. (Cl. 310—9.6)

1. A quartz crystal unit comprising a support plate of insulating material, two elongated electrical contact tracks of a conducting metal paste arranged side-by-side, but spaced apart, in contact with said plate throughout the length of the track, a quartz crystal plate parallel to said plate of insulating material, conducting electrodes on the two opposite faces of said quartz crystal plate, each of said electrodes having a part of its surface on the same side of said quartz crystal plate, and electrical connections between said contact tracks and said electrode parts on said same side of said quartz crystal plate.

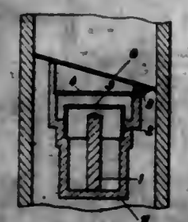


2,771,562
TELEPHONE RINGING GENERATOR
George F. McCarthy, Teaneck, and Adalen N. Gabbard, Palisades Park, N. J., assignors to International Telephone and Telegraph Corporation, Nutley, N. J., a corporation of Maryland
Application April 11, 1955, Serial No. 500,506
4 Claims. (Cl. 310—69)

1. An electric generator comprising a drive shaft, a rotor, means to transfer driving movement from said shaft to said rotor, said transfer means having a first cam element, a driving gear having a second cam element and a driven gear disposed in cooperation with the gear teeth of said driving gear, said first cam element being fixed to said drive shaft and said driving gear being rotatably carried by said shaft and movable axially on said shaft by a given amount, the teeth of said driving gear being maintained in mesh relation with respect to the teeth of said driven gear throughout the axial movement of said driving gear, means to normally bias said driving gear with said second cam element axially toward said first cam element, a switching element disposed adjacent said second cam element for actuation thereby when said second cam element is moved by cam action axially away from said first cam element.

---

2,771,563
CATHODE RAY DEFLECTION COILS
Wolfgang Reinhard, Pforzheim, Germany, assignor to International Standard Electric Corporation, New York, N. Y., a corporation of Delaware
Application November 8, 1951, Serial No. 255,353
Claims priority, application Germany November 10, 1950
5 Claims. (Cl. 313—76)



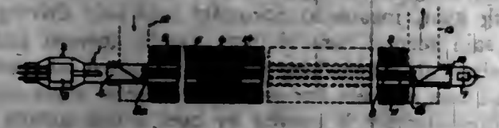
1. In a cathode ray tube of the electromagnetic deflection type, the combination with an envelope including an elongate neck portion leading into an enlarged end portion, a toroidal core of magnetic material positioned circumferentially of said envelope with a substantial portion thereof extending both along said neck portion and along said enlarged end portion, and a plurality of deflection coil windings operatively associated with said core.

2,771,564

**RADIATION GENERATION SYSTEM FOR ELECTRONIC RADIATION VALVES WITH IONIC TRAP**

Bernhard Hensel, Berlin-Friedenau, Germany, assignor to Loewe Opta Aktiengesellschaft, Berlin-Steglitz, Germany, a company of Germany

Application February 15, 1954, Serial No. 410,103
Claims priority, application Germany February 16, 1953
1 Claim. (Cl. 313—82)



An electrode system for electron beam tubes with ionic trap in which the first anode is shaped as a perforated diaphragm and is inclined against the plumb level of the beam axis, said first anode consisting of a perforated plate arranged vertical to the radiation axis and a second perforated plate inclined to said axis and connected with the first plate by an electrical conductor, said first perforated plate being arranged inside a cylindrical ceramic carrier, the face of which pointing in the direction of radiation is bevelled and carries said second perforated plate.

2,771,565

**TRAVELING WAVE TUBES**

John H. Bryant, Nutley, and Billy D. McNary, Pompton Lakes, N. J., assignors to International Telephone and Telegraph Corporation, a corporation of Maryland

Application August 19, 1952, Serial No. 305,151
6 Claims. (Cl. 315—3.5)

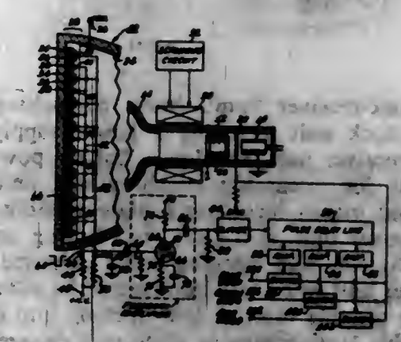
1. In a traveling wave electron discharge device having a conductor in the form of a helix for transmission of radio frequency energy and means to project a beam of electrons parallel to the axis of said helix having interaction with the electromagnetic field of the radio frequency energy transmitted by said conductor; an attenuator disposed along certain of the turns of said helix, said attenuator comprising a concentrated body of resistive material having its central portion only in direct contact with at least one of said certain turns for maximum attenuation and spaced relative to other of said certain turns for impedance transition, said helical conductor being supported by a plurality of dielectric rods disposed parallel to the axis of said helix and said portion of said body being disposed transversely between at least two of said rods.

2,771,566

**CATHODE RAY ELECTRON DISCHARGE DEVICE**

Albert J. Baracket, Bloomfield, N. J., assignor to International Telephone and Telegraph Corporation, a corporation of Maryland

Application January 9, 1953, Serial No. 330,524
7 Claims. (Cl. 315—16)



1. An automatic focus system for an electrostatic cathode ray electron discharge device having an envelope containing therein at least an electron emitter, a control electrode, a screen electrode, an accelerating electrode and a focusing electrode, comprising a low voltage power supply for supply of a predetermined D.-C. potential to certain ones of electron beam forming electrodes of said cathode ray device, a high voltage power supply for supply of a predetermined D.-C. potential to other ones of said electron beam forming electrodes, and a focusing unit located within the envelope of said cathode ray device, said focusing unit being coupled to said high voltage power supply and to said accelerating and said focusing electrodes for automatic maintenance of optimum electron beam focusing, said focusing unit including a series resistance coupled between said accelerating electrode and said focusing electrode to establish a D.-C. potential at said focusing electrode related to the D.-C. potential at said accelerating electrode by a predetermined fraction thereof, said series resistance comprising a layer of resistive material of predetermined configuration adhering to the inner surface of said envelope.

2,771,567

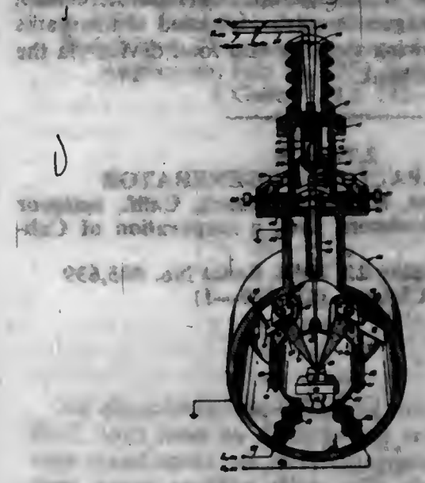
**COLOR TELEVISION**

Paul K. Weimer, Princeton, N. J., assignor to Radio Corporation of America, a corporation of Delaware

Application July 30, 1954, Serial No. 446,843
14 Claims. (Cl. 315—21)

1. In a cathode ray tube having means for producing an electron beam, a target comprising a plurality of groups of strip-like elements, each element of a group being definitive of a different selected component color of an image being televised and each group including at least three of said strip-like elements; a strip-like layer of conductive material on each of said color-definitive strip-like elements representative of a first color; and a strip-like layer of conductive material in each of said groups coextensive with at least a part of each of those strip-like color-definitive elements in that group other than that element representative of said first color.

2,771,568

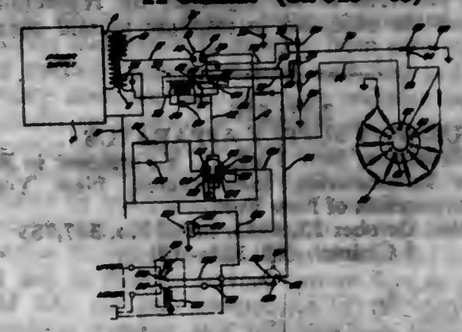


**UTILIZING ELECTRON ENERGY FOR PHYSICALLY AND CHEMICALLY CHANGING MEMBERS**

Karl Heinz Steigerwald, Meabach, Germany, assignor, by mesne assignments, to Carl Zeiss, Wurttemberg, Germany

Application November 28, 1951, Serial No. 258,671
6 Claims. (Cl. 315—31)

3. In an electron gun, a source of electrons, means for causing said electrons to move in a given direction, a control electrode adjacent said source of electrons at a point at which said electrons have relatively low velocity in the given direction, said control electrode comprising a conical and a cylindrical section, said conical section having its apex positioned downstream with respect to its base, said cylindrical section extending external of said conical section from the base thereof toward and beyond the said apex.



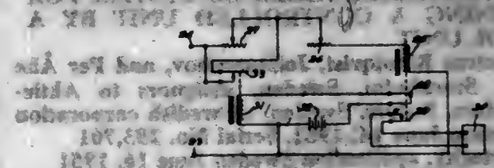
2,771,569

**AUTOMATIC HEADLIGHT DIMMER SYSTEM—HIGH VOLTAGE SWITCHING**

Charles W. Miller and Harold E. Todd, Anderson, Ind., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware

Application September 4, 1952, Serial No. 307,818
11 Claims. (Cl. 315—83)

1. In a control system for multibeam headlamps, a source of power, switching means connected to the source and to the headlamps alternately connecting said source to the different filaments of the headlamps, control means actuating the switching means connected to the source of power and including a light sensitive means, potentiometer means connected between the sources of power and the light sensitive means to supply voltage to the light sensitive means and additional switching means actuated by the control means connected in shunt to a portion of the potentiometer means between the source of power and the light sensitive means to vary the voltage supplied to the light sensitive means between the different filament energizing positions.



2,771,570

**ADJUSTABLE CIRCUIT CONTROL APPARATUS**

Charles H. Fishecker, Chicago, Ill., assignor to Cook Electric Company, Chicago, Ill., a corporation of Illinois

Application April 5, 1952, Serial No. 280,825
1 Claim. (Cl. 317—139)

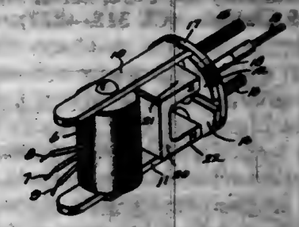
Circuit control apparatus for controlling external circuits in accordance with the magnitude of a controlling voltage comprising electromagnetic means to be energized by said controlling voltage, contact means controlled by said electromagnetic means for completing such external circuits, first resistance means in series with said electromagnetic means to determine a first control voltage of such external circuits, normally closed contact means to be opened by said electromagnetic means at said first control voltage, second electromagnetic means including time delay means to be energized when said normally closed contact means are closed, normally open contact means to be closed by the energization of said second electromagnetic means, and second resistance means connected across said normally open contact means and in series with said first resistance means and first electromagnetic means to determine a second control voltage for such apparatus.

2,771,571

**MAGNETIC CHUCK FACE PLATE**

George J. Carson, West Boylston, and Elmer B. Hallberg, Holden, Mass.

Application April 8, 1952, Serial No. 281,282
1 Claim. (Cl. 317—162)



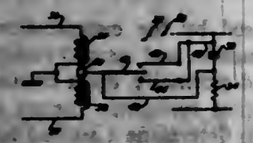
In a magnetic chuck, a face plate having a magnetic work-supporting surface and having a grooved clearance recess in said surface, and said grooved recess having a facing of non-magnetic material lining the sides and bottom thereof and effective to prevent magnetic adherence to any part of the structure enclosing said grooved recess of any ferrous object inserted in said recess.

2,771,572

**POLARIZED SELF-NEUTRALIZING SERVOMOTOR**

Frank R. Adams, Janesville, Wis.

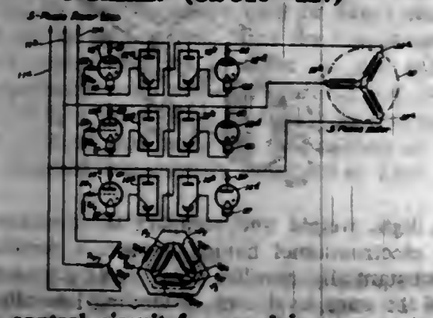
Application November 16, 1953, Serial No. 392,168
4 Claims. (Cl. 317—172)



1. A light weight and compact servo-motor comprising an electromagnet having a core, a winding on the core, substantially parallel polar arms connected to the ends of the core, said arms extending laterally from the core and having inturned ends with spaced apart margins comprising pole pieces for said electromagnet, a non-magnetic plate mounted on said pole pieces and spanning the space therebetween, said plate constituting a connector for tying together the ends of said arms, said plate being provided with a bearing between said pole pieces, a rock shaft rotatable in said bearing on an axis transverse to said core, and a polarized armature mounted on the rock shaft and having the form of a channel with elongated polar flanges rotatable in a plane substantially parallel to that of the pole pieces and adapted inherently to span the gap between the pole pieces when the

coil is de-energized, the flanges of the polarized armature being adapted to align themselves at opposite sides of the gap with particular pole pieces when the coil is energized.

---



2,771,573
**REMOTE CONTROL FOLLOW-UP SYSTEM FOR POSITIONING A CONTROLLED UNIT BY A CONTROL UNIT**
Åke Hugo Petrus Blomqvist, Johannesfred, and Per Åke Lindegren, Stockholm, Sweden, assignors to Aktiebolaget Bofors, Bofors, Sweden, a Swedish corporation
Application June 14, 1952, Serial No. 293,701
Claims priority, application Sweden June 16, 1951
9 Claims. (Cl. 318—30)

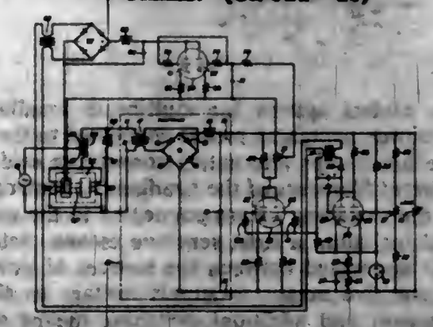
1. A follow-up system for positioning a controlled unit by a control unit situated at a remote point, the said system comprising electric signal means operatively connected with the control unit and the controlled unit and arranged to generate an error signal variable in strength corresponding to the position of the control unit and the controlled unit relative one to the other, amplifying means including filter network means connected in circuit with the signal means for feeding the said error signal to the input side of the amplifying means, reversible drive means operatively connected with the controlled unit for moving the latter, electric regulating means connected in circuit with the drive means for operational and directional control of the same and with the output side of the amplifying means for control of the regulating means by the signal output of the amplifying means as passed by the filter network means, the said filter network means including components sensitive to the signal strength and impeding the normal operation of the system in response to a signal having a strength above a predetermined value, and electric control means responsive to the signal strength and arranged electrically to inactivate the said components in response to a signal above the said predetermined value.

---

2,771,574
**MOTOR-CONTROL APPARATUS**
Charles Weller, Geneva, Ill., assignor to National Electronics, Inc., Geneva, Ill., a corporation of Illinois
Application January 19, 1956, Serial No. 560,162
5 Claims. (Cl. 318—227)

1. In a control circuit for supplying power to a load device from a three-phase power line, said load device having a plurality of input terminals, the combination which comprises two banks of ignitron tubes connected between said line and said input terminals to provide going and return current paths for load current, adjustable phasing means connected in circuit with the ignitor electrodes of the ignitrons in one of said banks for initiating the conduction periods of such ignitrons in predetermined phase relation to the power-line voltage, and charge-responsive means connected in circuit respectively between said input terminals and the ignitor electrodes of the ignitrons in said other bank operative to initiate conduction periods of said other ignitrons in automatic response to the accumulation of charge on said input terminals, whereby said other ignitrons provide timed return paths for load current flowing through said load device via the ignitrons in said first bank.

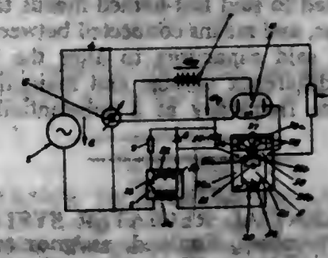
---



2,771,575
**DIODE CAPACITOR REGENERATOR**
Robert W. Hampton, Richmond Annex, Calif., assignor to Marchant Calculators, Inc., a corporation of California
Application January 22, 1954, Serial No. 405,639
13 Claims. (Cl. 320—1)

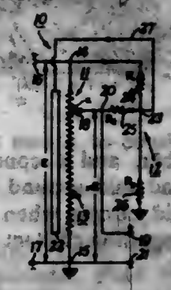
3. A capacitor charge regenerator comprising: a precharged capacitor; a normally nonconducting gas-filled diode having first and second electrodes; means for establishing a pulse circuit from the capacitor to said first electrode for causing conduction of said diode if at least a predetermined minimum absolute value of charge resides on said capacitor; means for changing the potential of said second electrode in response to said conduction; and means for establishing a D. C. circuit from said second electrode to the capacitor for regenerating the charge on the capacitor in response to said change of potential.

---



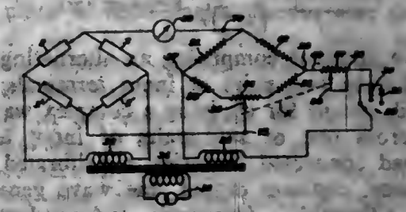
2,771,576
**CURRENT SUPPLY APPARATUS**
George W. Mesmore, New York, N. Y., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application October 22, 1953, Serial No. 387,753
6 Claims. (Cl. 321—18)

1. In combination, rectifying means having an input and an output, said rectifying means having resistance, a load connected across said output, means for impressing an alternating voltage from an alternating-current supply source upon said input to cause direct current to be supplied to said load, a space current device having a space current path and control means for controlling the resistance of said space current path in response to a control voltage impressed upon said control means, a shunt current path including said space current path connected across said output in parallel with said load, means for impressing upon said control means a control voltage which varies in response to load voltage changes for substantially instantaneously controlling the current in said shunt current path to minimize said changes of load voltage, and means responsive to average current changes in said shunt current path for controlling the alternating voltage impressed upon said input to minimize changes of average current in said shunt current path.



2,771,577
**ELECTROMAGNETIC SWITCHING CIRCUITS**
Fritz Kesselring, Zollikon-Zürich, Switzerland, assignor to FKG Fritz Kesselring Gesellschaft A. G., Bachtobel-Wetzikon, Thurgau, Switzerland
Application July 24, 1951, Serial No. 237,721
1 Claim. (Cl. 321—48)

An electromagnetic switching circuit for energizing a D.-C. load from an A.-C. source comprising a saturable core transformer, an electromagnetic switch and a mercury vapor rectifier tube; said electromagnetic switch comprising a core assembly, a switching element and an energizing coil; said energizing coil being wound on said core assembly, said core assembly having a first and second portion; said first and second portions being positioned to form a magnetic loop with first and second series connected air gaps; the opposed surfaces of said first and second portions forming said first air gap comprising a first and second stationary contact for bridging contact cooperation with said switching member; a resilient restraining means; said resilient restraining means being operatively connected to said switching member; said resilient restraining means being constructed to resiliently restrain said switching member from entering into bridging contact engagement with said first and second stationary contacts; said switching member being at least partially constructed of magnetic material; said switching member being movable into contact engagement with said first and second contacts responsive to the magnetic field created by energization of said energizing coil; said second air gap being positioned to prevent electrical conduction through the core material adjacent to said second air gap to thereby prevent current flow in parallel with said first air gap irresponsive of the position of said switching member; said saturable core transformer comprising a magnetic core having an air gap therein and a primary and secondary winding; said A.-C. source, D.-C. load, second portion of said electromagnetic switch core assembly, switching element, first portion of said electromagnetic switch core assembly, energizing winding and said saturable transformer primary winding being connected in series; said rectifier tube comprising a plate, a control grid and a hot cathode; said rectifier tube having a saturating current of at least one ampere; a rectifier and a capacitor; said rectifier and said capacitor being connected in parallel with one another and in series with said first air gap and said plate and cathode of said rectifier tube; said parallel connection of said rectifier and said capacitor being connected in series with said saturable transformer secondary winding; a source of grid voltage for said rectifier tube; said source of grid voltage for said rectifier tube being constructed to impress an alternating potential having a positive direct component between said grid and cathode of said rectifier tube; said source of said grid voltage being further constructed to adjustably shift the phase of the alternating voltage component with respect to the phase of the voltage of said A.-C. source to thereby control the time of contact engagement with respect to said A.-C. source; said saturable core transformer supplying the plate potential for said rectifier tube during the interval immediately preceding contact disengagement to that the current through said contacts is substantially smaller than the current through said energizing coil.



2,771,578
**POTENTIAL DIVIDER COUPLING CIRCUITS**
James L. West and Meaven H. Hayes, Binghamton, N. Y., assignors to Link Aviation, Inc., Binghamton, N. Y., a corporation of New York
Application January 11, 1954, Serial No. 403,400
21 Claims. (Cl. 323—79)

1. A coupling circuit comprising as a voltage source a potential divider having impedance means and a conductive body located in capacitive relation to said impedance means, and a summing and dividing network connected between said voltage source and said conductive body to minimize phase shift between said impedance means and said conductive body.

---

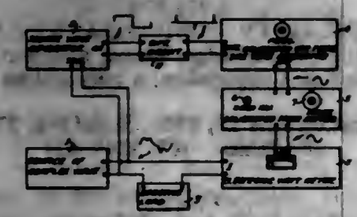
2,771,579
**NON-LINEARITY COMPENSATION MEANS**
Arthur C. Rupp, Cambridge, Mass., assignor to Baldwin-Lima-Hamilton Corporation, a corporation of Pennsylvania
Application July 23, 1953, Serial No. 372,829
8 Claims. (Cl. 324—62)

1. A measuring circuit comprising at least one potentiometer network responsive to a condition to be measured and said network having two input and two output terminals whereby the electrical output of said network is responsive to the condition, a voltage source for energizing the potentiometer network, said voltage source being connected in series wiht said input terminals, means responsive to the said condition and means controlled by said condition responsive means for causing the voltage acting across said input terminals to vary automatically as a predetermined function of both the magnitude of said condition and of the magnitude of said voltage source, said last-named means having an element connected in series with said voltage source whereby the output of said potentiometer network in response to the condition is caused to vary non-linearly in a predetermined manner from the output of the network when energized only from a constant voltage source, and measuring means responsive to the output of said potentiometer network.

---

2,771,580
**TEST PROBE**
John T. Schott, Plainfield, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application April 27, 1953, Serial No. 351,301
5 Claims. (Cl. 324—72.5)

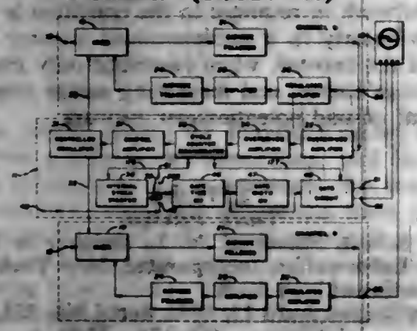
4. A test probe comprising a tubular metallic housing member, a test electrode insulatedly mounted in said member and protruding therefrom, a movable coaxial insulating sleeve enclosing said electrode and slid-



ably mounted thereon, a spring member in said housing biasing said sleeve outwardly to an extended position protruding beyond the tip of said electrode, a conductive circuit terminating in said electrode for connecting to an associated indicating device, a ground terminal mounted

on said housing member, and a conductive circuit between said electrode and said ground terminal including means for opening said circuit when said sleeve is retracted, said means comprising contact members mounted in said movable sleeve.

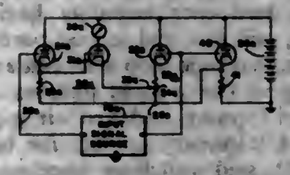
---



2,771,581
WAVE ANALYZER
Robert W. Stahmbach, Dayton, Ohio, assignor to the United States of America as represented by the Secretary of the Air Force
Application October 14, 1955, Serial No. 540,658
4 Claims. (Cl. 324—77)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. A wave analyzer comprising an alternating current wattmeter having two pairs of input terminals; a non-reactive load; means for applying a complex wave to be analyzed across one of said pairs of input terminals and said load connected in series; a calibrated, adjustable frequency, constant output sine wave generator; a calibrated, adjustable, frequency independent phase shifter; means coupling the output of said generator through said phase shifter to the other of said pairs of terminals; and means responsive to said complex wave and connected to said generator for synchronizing said generator with said complex wave.

---



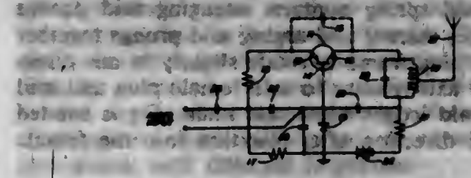
2,771,582
PHASE METER
Chester N. Winningstad, San Lorenzo, and Quentin A. Kerns, Berkeley, Calif., assignors to the United States of America as represented by the United States Atomic Energy Commission
Application December 9, 1953, Serial No. 397,288
2 Claims. (Cl. 324—85)

1. In a radio-frequency phase meter having an oscillator with biased voltage-sensitive capacitors in a frequency-determining tank circuit and means developing a voltage at a frequency equal to the difference frequency between an input voltage and the voltage of said oscillator, the combination comprising amplifier means developing a square wave voltage in response to said voltage of difference frequency, means connected to said amplifier means developing a voltage having a magnitude proportional to said difference frequency, voltage means having a valve of voltage proportional to the bias of said capacitors connected to said last-named means to provide a difference voltage, and means connected between said voltage means and said capacitors to alter the bias in response to said difference voltage and maintain the voltage of difference frequency at a substantially constant frequency.

---

2,771,583
DIFFERENTIAL REPEATER SYSTEM
Alfred Bloch, Wembley, England, assignor to Hazeltine Research, Inc., Chicago, Ill., a corporation of Illinois
Application June 28, 1952, Serial No. 296,233
Claims priority, application Great Britain July 2, 1951
4 Claims. (Cl. 324—123)

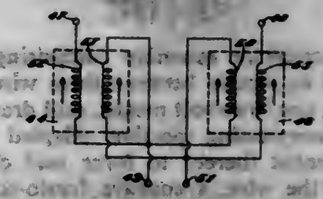
1. A differential repeater system comprising: two electron-discharge devices having substantially identical electrical characteristics and including individual anodes, cathodes, and control electrodes; individual cathode resistors having first terminals connected to individual ones of said cathodes and having interconnected second terminals; a source of potential having a positive terminal coupled to said anodes and a negative terminal coupled to a fixed potential point; an alternating-potential source comprising an impedance bridge circuit including a first pair of conjugate terminals, one thereof being connected to said point, and including a second pair of conjugate terminals coupled between said control electrodes for supplying thereto an input signal having a value small with reference to potentials developed between said control electrodes and said point thereby to control anode-cathode electron discharges in said devices; an output circuit including an alternating-current meter coupled to said two devices and responsive to the difference between the magnitudes of said anode-cathode electron discharges therein for deriving an output signal representative of said input signal and the difference between the magnitudes of said discharges; and a control apparatus including a cathode-follower repeater having an input circuit connected between one of said control electrodes and said interconnected terminals and having one terminal of the cathode resistor thereof connected to said point for deriving between said interconnected terminals and said point a control potential substantially equal to said developed potentials, whereby said output signal is substantially unaffected by the value of said developed potentials.



---

2,771,584
FREQUENCY-CONTROLLED TRANSISTOR OSCILLATORS
Donald E. Thomas, Madison, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application April 15, 1953, Serial No. 348,991
19 Claims. (Cl. 332—29)

1. In combination, a transistor, means to produce self-oscillations by said transistor, and means to vary the c

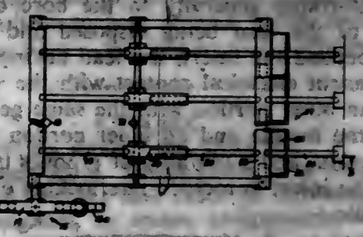


cut-off frequency of said transistor under the control of

an input signal, whereby the oscillation frequency of said transistor is varied under the control of the input signal.

---

2,771,585
IMPEDANCE TRANSFORMER NETWORK
Vincent R. De Long, Cedar Rapids, Iowa, assignor to Collins Radio Company, Cedar Rapids, Iowa, a corporation of Iowa
Original application April 26, 1951, Serial No. 223,090, now Patent No. 2,669,698, dated February 16, 1954. Divided and this application October 6, 1952, Serial No. 313,243
3 Claims. (Cl. 333—32)



1. An impedance transformer for obtaining a nine-to-one impedance transformation at high impedance levels comprising first and second inductance coils, each coil including first and second input terminals and first and second output terminals, each coil also having a pair of separate windings, with one of said windings being connected between the first input and output terminals, and the other of said windings being connected between the second input and output terminals of the respective coil, each of said windings having two groups of turns wound in the same direction, two closely-wound turns forming each of said groups, with said groups being spaced widely apart relative to the spacing of the turns within a group, each coil having the groups of one winding interleaved with the groups of its other winding in spaced relationship, said transformer having first and second input points, with one input point connected to the first input terminal and the second output terminal of said first coil and to the first input terminal of said second coil, the second input point being connected to the second input terminal of said first coil and to the second input terminal and the first output terminal of said second coil, and output points for said transformer being provided by the first output terminal of said first coil and the second output terminal of said second coil.

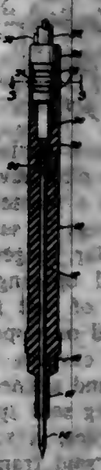
---

2,771,586
NOISE SUPPRESSION DEVICE
Michael J. Di Toro, Bloomfield, N. J., assignor to International Telephone and Telegraph Corporation, a corporation of Maryland
Application May 20, 1952, Serial No. 288,903
3 Claims. (Cl. 333—71)

2. A noise suppression circuit for electrical signals having a wide band of frequencies comprising means to convert said electrical energy into equivalent mechanical energy, means to separate said mechanical energy into a plurality of channels having different predetermined frequency sub-bands, means in each channel to impart a non-linear characteristic to the energy transmitted through subject channel comprising a cam having curved surfaces, means to couple said cam to said separating means, and means to couple energy from the curved surface of said cams, means to reduce distortion due to the imparting of the non-linear characteristic in each

channel and output means to combine the energy of all channels.

---



2,771,587
INDUCTIVE DEVICE
Wayne L. R. Henderson, Fort Wayne, Ind., assignor to General Electric Company, a corporation of New York
Application November 12, 1953, Serial No. 391,612
14 Claims. (Cl. 336—160)

1. An inductive device comprising a first generally O-shaped wound core member, a second wound core member formed of two generally U-shaped portions respectively arranged on either side of said first core member and in a plane at right angles thereto with the ends of the legs of said U-shaped portions being respectively magnetically adjacent opposite sides of said first core member, the laminations of the ends of said legs being respectively in the same planes as the laminations of said opposite sides of said first core member, and at least two coils respectively arranged on only one of said core members on either side of the other of said core members.

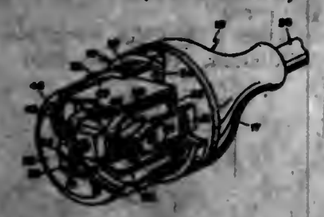
---

2,771,588
PROD CONSTRUCTION FOR VOLTAGE TESTERS AND THE LIKE
William G. Schlaebe and Lee B. Mitchell, Sycamore, Ill., assignors to Ideal Industries, Inc., Sycamore, Ill., a corporation of Delaware
Application August 24, 1953, Serial No. 376,056
3 Claims. (Cl. 339—102)

1. In an electric prod structure, an elongated handle composed of an insulating moldable material, an elongated metal spike molded and imbedded in the handle and projecting from one end, a plug insert imbedded in the

other end of the handle having a central bore generally aligned with the spike, an insulated lead extending through and conforming generally to the bore of the insert, a portion of the lead being disposed and molded in the handle beyond the insert, the lead having a stripped end in permanent electrical contact with the spike, the insert having an outer portion with the same general cross section as the handle and an inner portion with a reduced cross section, and a plurality of grooves in the inner portion of the insert in molded interlocking engagement with the handle.

---



2,771,589
**END CAP FOR FLUORESCENT LAMP**
Ralph Burgess Thomas, Salem, Mass., assignor to Sylvania Electric Products Inc., Salem, Mass., a corporation of Massachusetts
Application December 14, 1954, Serial No. 475,221
4 Claims. (Cl. 339—144)

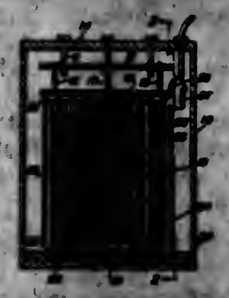
1. In combination with a high voltage tubular fluorescent lamp having a glass envelope and filament lead-in wires projecting from one end thereof, a cap mounted on the end of said glass envelope around said lead-in wires comprising a base, an upstanding elongated boss integral with said base, said boss having an upper end wall, internal walls defining an open passage from the outside through said boss and said base to said envelope, the upper end wall of said boss being indented to form a longitudinal slot therein, a pocket in said slot on each side of said passage, said lead-in-wires extending upwardly through said passage and laterally adjacent to the bottom wall of said slot, one of said lead-in wires terminating in each of said pockets, and an eyelet in frictional engagement with each of said lead-in wires and the walls of one of said pockets.

---

2,771,590
**INTERLOCKING ELECTRICAL PLUG ASSEMBLY**
Benjamin F. Nassler, San Diego, Calif.
Application May 15, 1953, Serial No. 355,299
1 Claim. (Cl. 339—168)

An interlocking electrical plug assembly including a female plug and a male plug having a common axis, said female plug comprising a frame having a central pillar, a pair of slotted openings in said frame spaced on opposite sides of said pillar, ledges within said frame disposed laterally of said openings and defining arcuate cavities with the walls of said frame, a pair of looped spring contacts disposed on opposite sides of said pillar and positioned in said cavities, the loops thereof being opposed to each other and aligned with said openings, insulated plates supporting said spring contacts and holding them in said cavities, a screwed electrically conductive cap secured to said frame and having a central terminal insulated from the cap, one of said spring contacts being connected to said cap and the other of said spring contacts being connected to said terminal, said male plug comprising a frame having a pair of prongs spaced to align with said openings, said prongs each having a projecting lip, said lips being on opposite sides of said prongs, said spring contacts engaging said prongs on opposite sides thereof and urging said prongs together with said male plug frame to rotate slightly in one direction about said axis relative to said female plug and said lips engaging said ledges when said male plug is rotated slightly in said direction after insertion into the female plug.

---

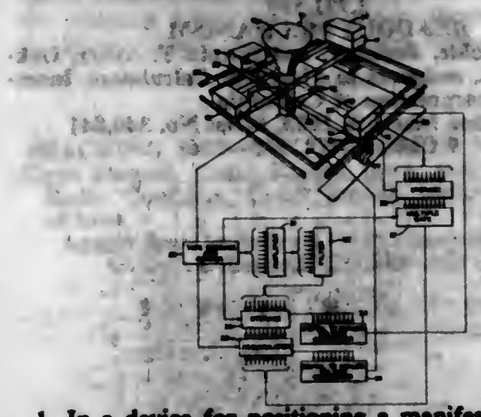


2,771,591
**ELECTRICAL DRAWBOLT TYPE CONNECTOR WITH CONSTANT LOAD WASHER**
Oliver A. Verdriede, St. Louis, Mo., assignor to A. B. Chance Company, Centralia, Mo., a corporation of Missouri
Application May 25, 1953, Serial No. 357,323
3 Claims. (Cl. 339—263)

1. A wire connector assembly comprising two clamp means adapted to receive between them wire to be connected, at least one drawbolt means, said drawbolt means including a compressing portion adapted upon rotation of an element thereof to force said clamp means together upon the wire, a concave frusto-conical spring washer located around the draw-bolt means and also between said compressing portion and one of the clamp means, said washer being characterized in that it has a load-deflection curve including a substantially flat portion over which the load does not substantially change for a substantial range of deflection of the spring washer, whereby the washer may be forced by said compressing portion to a deflection under which relaxing wire movement may occur under a substantially constant pressure on the wire.

---

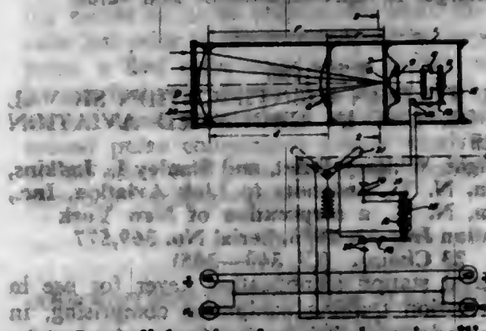
2,771,592
**DETECTING AND RECORDING SYSTEM FOR SEISMIC WAVES**
Jack W. E. Edmonson, San Antonio, Tex.
Application January 9, 1953, Serial No. 330,568
4 Claims. (Cl. 346—17)



1. A capacitive seismometer comprising a stationary housing, a condenser having condenser electrodes facing each other across a dielectric, each electrode consisting of a series of spaced electrically connected electrode strips, a stationary condenser electrode carrier, carrying one series of spaced electrode strips, means for mounting the stationary condenser electrode carrier fixedly in the stationary housing, a movable electrode carrier, carrying a series of spaced electrode strips facing the aforesaid series carried by the fixed electrode carrier, means for mounting the said movable condenser electrode carrier resiliently for free oscillation in a plane parallel to the fixed electrode carrier, said spaced electrode strips extending substantially transversely with respect to the direction of said oscillatory movement, the width of the individual

electrode strips of each series in the direction of movement differing from each other, pairs of facing strips being of substantially equal width so that equal displacement from any point in its normal range of movement of the resiliently mounted electrode carrier indexes different capacity changes in the pairs of electrode strips carried by the condenser electrode carriers facing each other, resulting in a more uniform rate of capacity change for movements with different amplitude.

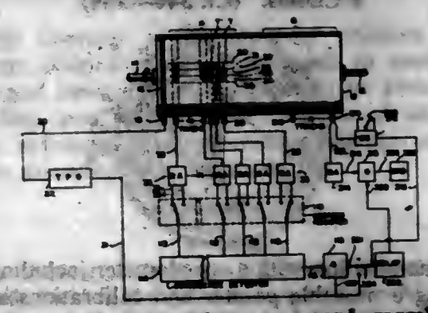
---



2,771,593
**ERROR POSITION INDICATOR FOR TARGET MANIFESTATION DEVICE**
Robert N. Strandt, Binghamton, N. Y., assignor to International Business Machines Corporation, New York, N. Y., a corporation of New York
Application January 20, 1954, Serial No. 405,071
7 Claims. (Cl. 340—24)

1. In a device for positioning a manifestation, means for providing said manifestation, means mounting the last-named means for translation over an area, motive means operatively associated with said mounting means for causing translation thereof, means for receiving position data to control said motive means, means for providing an output signal which is a function of the error in the present position of said mounting means in relation to the position data input, and means for moving said manifestation relative to said mounting means under the control of said output signal.

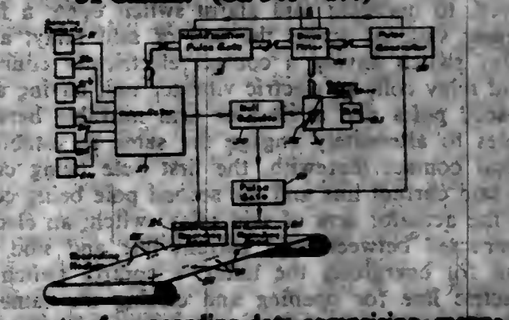
---



2,771,594
**PASS-SIGNAL DEVICE FOR ROAD VEHICLES**
Charles Gourdon, St. Mandé, France, assignor to Avertisseurs Roulers Silencieux, Paris, France, a company of France
Application January 8, 1952, Serial No. 265,498
Claims priority, application France March 1, 1951
8 Claims. (Cl. 340—34)

1. In a light signal responsive signalling system for vehicles, a receiver device, comprising, in combination, an elongated casing open at one end thereof, convergent lens means mounted in said opening, a photo electric cell located in said casing at the other end thereof, a partition in said casing located intermediate said lens means and said photo electric cell and formed with a rectangular horizontal slot located in the focal point of said lens means; and a convergent lens mounted between said partition and said photo-electric cell and adapted to project light rays passing through said slot on substantially the entire light sensitive surface of said photo electric cell while extraneous light is blocked by said partition.

---



2,771,595
**DATA STORAGE SYSTEM**
Arnold P. Hendrickson, Minneapolis, and William R. Keye, St. Paul, Minn., and John H. Howard, Springfield, Pa., assignors, by mesne assignments, to Sperry Rand Corporation, New York, N. Y., a corporation of Delaware
Application December 30, 1950, Serial No. 203,612
1 Claim. (Cl. 340—174)

In data storage apparatus, a record member, magnetic transducer locator scanning means positioned to scan a plurality of magnetizable locator tracks along the record member, means for imparting relative movement between the member and said scanning means for causing said scanning, an area of the record member apart from the locator tracks for containing information, and means for locating predetermined points along said area for a transducing operation therein by an information scanning means, the locating means including coincidence detection means connected to said locator transducer means for comparing binary digital signals generated in said locator transducer means from binary digital signals recorded in said locator tracks with pre-set binary signals for generating an output signal upon occurrence of detection of coincidence between said generated and pre-set binary signals, the apparatus further including a timing transducer positioned to scan a timing track along the member, the timing transducer being responsive to uniformly arrayed repetitive timing indicia on the timing track for generating timing signals having predetermined time occurrence in relation to the positions of said binary digital signals recorded in said locator tracks, and means for gating out said output signals of said coincidence detection means only during the existence of a timing signal.

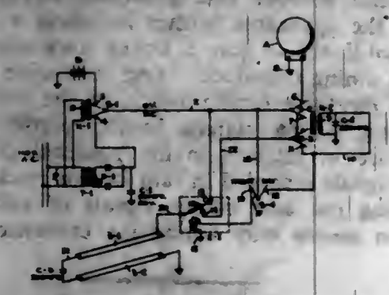
---

2,771,596
**METHOD AND APPARATUS FOR RECORDING AND REPRODUCING DATA**
John C. Rabbany, Chicago, Ill., assignor to Cook Electric Company, Chicago, Ill., a corporation of Illinois
Application June 2, 1950, Serial No. 165,844
31 Claims. (Cl. 340—177)

1. Apparatus for recording data comprising, means for sensing the value of said data in terms of voltage, a re-

corder, a pulse generator for supplying a continuous series of pulses to said recorder, potentiometer means for cyclically sweeping through a voltage varying between certain values and for comparing said sweep voltage with said data voltage, and means for completing a circuit for supplying said pulses from said generator to said recorder when said sweep voltage is at one of said certain values and interrupting said circuit when compared value of voltage is equal to zero.

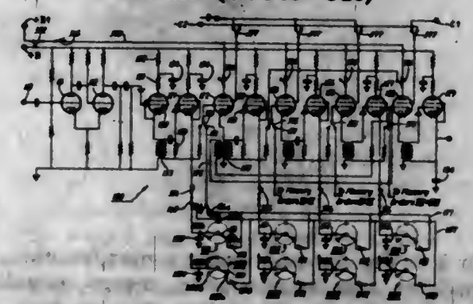
---



**2,771,597**
**SPEED WARNING**
Louis H. Freedman, Fort Worth, Tex.
Application December 1, 1955, Serial No. 550,333
6 Claims. (Cl. 340—266)

1. In combination with a speedometer including a case and having a movable pointer and calibrations arranged near the pointer tip, a speed warning device comprising a light emitter in said case mounted to move with said pointer, means in said case activating said light emitter, a photosensitive cell arranged to receive light from said emitter at a speed indicating position of said pointer relative to said calibrations, an electrical signal, and means electrically connecting said signal with said photosensitive cell.

---



**2,771,598**
**ALARM SYSTEM**
Harry Gerber, Glendale, Calif., assignor to Simplex Industrial Products, Inc., Glendale, Calif., a corporation of California
Application June 16, 1955, Serial No. 515,951
4 Claims. (Cl. 340—276)

1. An electric alarm system, comprising: a low voltage D. C. line; an alarm device and circuit therefore, said circuit being energizable from said current line; an alarm switch interposed between said circuit and said current line, closing of said switch effecting energization of said alarm device; a relay operative, when energized, to maintain said alarm switch open; a first condenser shunted across the coil of said relay; a second, relay switch having a contact electrically connected to said relay coil; an electric vibrator unit having a pair of spaced poles and a vibrator arm movable between the poles to alternately engage the same to establish electrical contact therewith, the first pole being connected to said current line and the second pole being connected to the actuator arm of said relay switch; an electric line connected between said current line and said vibrator unit for energizing the latter; a control switch in said electric line for opening and closing the same; a first metallic strip electrically connected to said vibrator arm; a second metallic strip connected to ground; and a second condenser connected between said strips, closing of said control switch causing current flow to said vibrator unit to energize the same, engagement of said vibrator arm with said first pole causing current flow through said tapes and charging of said second condenser, disengagement of said vibrator arm from said first pole and subsequent engagement of this arm with said second pole effecting discharge of the electric potential from said second condenser and current flow to said first condenser and said relay coil so as to energize said relay and thus maintain said alarm switch open and said relay switch closed, breaking or aborting of either of said metallic strips resulting in opening or shorting the circuit between said condensers and thus rendering said relay inactive to allow closing of said alarm switch and energization of said alarm device.

---

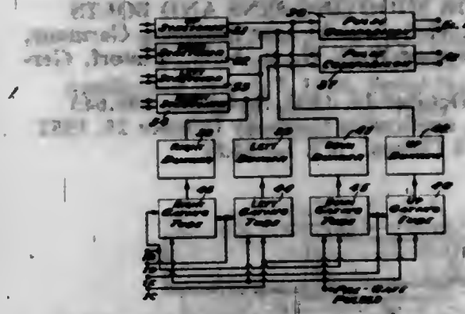
**2,771,599**
**READOUT MECHANISM**
George V. Noble, Berkeley, and Harold T. Avery, Oakland, Calif., assignors to Marchant Calculators, Incorporated, a corporation of California
Application March 6, 1953, Serial No. 340,841
9 Claims. (Cl. 340—316)

1. The combination of: a plurality of capacitors capable of storing electrical charges; means for impressing a selected one of a plurality of combinations of charges on said capacitors, the selected combination of charges representing a respective numeral value and each charged capacitor representing an increment of said value; a sensing circuit; switching means for connecting the sensing circuit to the various capacitors in a predetermined sequence for temporarily energizing the sensing circuit in response to each sensing of a charged capacitor; a movable indicia-bearing member; and mechanism connected to the sensing circuit and responsive to each energization of the latter for imparting to said member a movement proportional to the increment of said value represented by the charged capacitor to which the sensing circuit is connected, whereby the cumulative movement of said member in response to the sensing of said selected combination of charges is representative of said value.

---

**2,771,600**
**UNIVERSAL STATION IDENTIFICATION SIGNAL KEYER FOR USE IN GROUNDED AVIATION TRAINERS**
Leroy D. Wright, Whitney Point, and Stanley L. Judkins, Binghamton, N. Y., assignors to Link Aviation, Inc., Binghamton, N. Y., a corporation of New York
Application July 22, 1953, Serial No. 369,577
23 Claims. (Cl. 340—365)

1. A universal station identification keyer for use in grounded navigation training equipment comprising, in combination, a selector switch having four wafers or the like representing the first, second, third and fourth characters of Morse code letters, each of said wafers having a separate contact for each letter of the alphabet having a Morse code character represented by the wafer, each of said contacts being connected to dot or dash regulating means according to whether the Morse code character represented by the contact is a dot or a dash, a control



for selecting the contacts of the wafers according to the Morse code pattern of any letter of the alphabet, a signal emitter, keying means for activating the signal emitter, a plurality of sequentially operable relays for scanning the selected contacts of the respective wafers to control the

activated periods of the emitter by said dot or dash regulating means in accordance with the potentials on the selected contacts of the wafers, and a bi-stable switching means responsive to said regulating means for activating the scanning relays and alternately therewith disabling the keying means to provide spaces between characters.

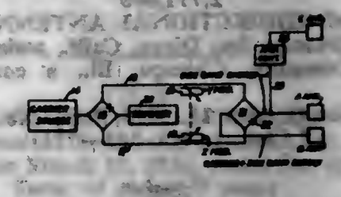
---

**2,771,601**
**TRACKING AND SYNCHRONIZING MECHANISM**
Clyde Stewart, Cedar Rapids, Iowa, assignor to Collins Radio Company, Cedar Rapids, Iowa, a corporation of Iowa
Application December 8, 1951, Serial No. 260,747
6 Claims. (Cl. 343—11)

1. Means for producing elevation and azimuth tracking signals for a radar set comprising, a radar receiver, a master timer supplying pregate pulses immediately preceding received pulses, a four horn antenna receiving the received pulses, switching means connected between the receiver and said antenna, dividing means receiving an output from the master timer and supplying inputs to said switching means, four pulse stretching circuits having their inputs connected to the output of said receiver, said pulse stretching circuits receiving outputs from said dividing means so that each circuit receives every fourth received pulse, dunking means connected to said pulse stretching circuits and receiving inputs from said dividing means so as to respectively dunk the stretcher circuits just prior to the reception of its respective received pulse, a first pulse comparison circuit receiving inputs from a first pair of said stretching circuits to produce an output signal proportional to the azimuth error, and a second pulse comparison circuit receiving the outputs of the other two pulse stretching circuits to produce an elevation tracking signal.

---

**2,771,602**
**ABSORPTION DEVICE FOR ELECTRO-MAGNETIC WAVES**
Rudolf Kühnhold, Braunschweig, Germany, assignor to Electroacustic Gesellschaft mit beschrankter Haftung, Kiel, Germany, a corporation of Germany
Application February 12, 1954, Serial No. 409,988
Claims priority, application Germany February 16, 1953
12 Claims. (Cl. 343—18)



1. An absorption device for electro-magnetic waves comprising a plurality of electrically-conductive grid structures, each grid structure comprising a first plurality of mutually parallel elongated grid elements crossed with a second plurality of mutually parallel elongated grid elements, said grid structures being arranged in spaced relation behind one another, the average conductance of the front one of said grid structures being equal to the

dielectric constant of the material between said grid structures divided by the wavelength in centimeters of the longest electro-magnetic wave to be absorbed, each succeeding front to back grid structure of said plurality of grid structures being of greater average conductance than its preceding grid structure.

---

**2,771,603**
**INSTRUMENT LANDING SYSTEMS**
Sidney B. Pickles, Tarrytown, and Anthony M. Casabona, Hawthorne, N. Y., assignors to International Telephone and Telegraph Corporation, a corporation of Maryland
Application January 13, 1953, Serial No. 331,090
8 Claims. (Cl. 343—108)

1. Glide path apparatus for instrument landing of aircraft comprising first antenna means and second antenna means disposed generally above said first antenna means, a source of carrier frequency energy, first means to modulate said carrier frequency energy with a first given frequency, and second means to modulate said carrier frequency energy with a second given frequency to produce sideband energy, means to couple said carrier energy and said sideband energy to said first antenna means, means to couple said sideband energy to said second antenna means, third antenna means disposed generally above said first and second antenna means, and means to couple said sideband energy to said third antenna means.

---

**2,771,604**
**VEHICULAR SHORT-WAVE ANTENNA**
Samuel E. Goldstein, Los Angeles, Calif.
Application April 3, 1951, Serial No. 219,044
1 Claim. (Cl. 343—749)

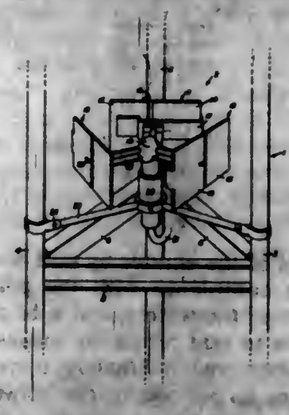
A short-wave antenna of the linear radiator type comprising a pair of relatively lengthy colinear conductive radiator elements having their proximate ends formed to provide threaded studs, and an inductance coil assembly connecting the proximate ends of said elements to constitute the sole mechanical and electrical connection therebetween, said inductance assembly comprising an insulating cylindrical form, an internally threaded metallic collar within each end of said form, an inductance coil wound upon the outside of said form and having each of its opposite ends secured by a conductive screw passing radially through the form and threaded into the respective metallic collar thereof, whereby said screws serve to connect the ends of the coil to the respective collars and to maintain said collars mechanically in position within the ends of said form, a cylindrical metallic

shield open at one end and bell-shaped at the other, said shield encompassing said form and coil with the threaded stud of one of said radiator elements passing through an aperture in the bell shaped end of the shield and threaded

into one of said collars, an insulating spacer disc disposed snugly within the other and open end of said shield, and the threaded stud of the other of said radiator elements passing through an aperture in said spacer disc and threaded into the other of said collars.

---

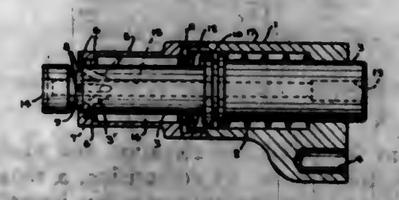
2,771,605
OMNIDIRECTIONAL ANTENNA
Robert A. Kirkman, San Diego, Calif., assignor to Cook Electric Company, Chicago, Ill., a corporation of Illinois
Application October 11, 1954, Serial No. 461,355
7 Claims. (Cl. 343—771)



6. Microwave apparatus comprising a vertically disposed cylindrical wave guide, energizing means for feeding to said guide a transverse electrical wave of dominant mode polarized in a horizontal plane, means in said guide for circularly polarizing said wave in a horizontal plane, and antenna means at the exit of said wave guide for transmitting said wave into space uniformly in all substantially horizontal directions with a vector orientation fixed in a predetermined angular relationship to the axis of said wave guide and the horizontal plane.

---

2,771,606
ULTRA-HIGH FREQUENCY ANTENNA SYSTEM
Arnold G. Kandoian, Glen Rock, N. J., assignor to International Telephone and Telegraph Corporation, a corporation of Maryland
Application February 11, 1953, Serial No. 336,396
1 Claim. (Cl. 343—890)

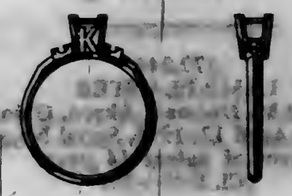


An antenna array comprising a support structure including a plurality of vertical support members disposed about a central vertical axis to form a substantially closed geometric pattern having a given horizontal cross-sectional area and horizontal brace members interconnecting said vertical support members in vertically spaced planes to form a sturdy tower construction, a plurality of horizontally polarized loop radiators of loop area smaller than said cross-sectional area, each of said loop radiators having an axially disposed hub and a plurality

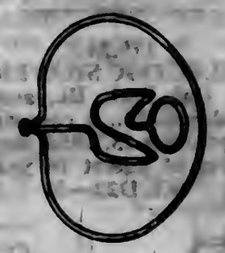
of spoke supports disposed radially thereof and means coupling said spoke supports to said support structure to locate the radiator within the zone defined by said vertical support members and two adjacent planes formed by horizontal brace members.

---

2,771,607
DEVICE FOR SHOOTING PINS AND BOLTS
Max Skumawitz, Tiefenbroich, near Ratingen, Germany, assignor to Bozong-Werk G. m. b. H., Lintorf, Germany
Application October 16, 1953, Serial No. 386,643
Claims priority, application Germany October 25, 1952
3 Claims. (Cl. 1—44.5)



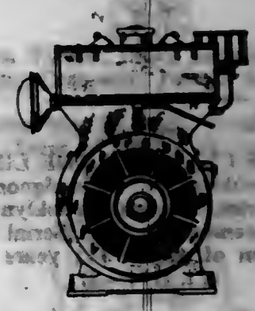
1. A device for shooting pins and bolts into solid material aggregates, such as concrete and stone walls, comprising, in combination, an outer casing, a barrel having a rear portion, a middle portion and a front portion, said casing being axially displaceable with respect to said barrel, an abutment forming part of said barrel, a recoil spring located between said abutment of said barrel and the end wall of said casing so as to hold in the expanded position of said recoil spring said barrel and said casing in a relative position wherein said middle and front portions of said barrel protrude beyond said casing, a sleeve connected to the front portion of said casing and surrounding said middle portion of said barrel, said sleeve forming a gas release chamber surrounding said middle portion of said barrel so as to act as a recoil buffer, and a flange forming the front end of said sleeve, said barrel having a longitudinal bore connected with gas exit openings arranged between said front and middle portions of said barrel, said flange cooperating with said gas exit openings arranged between said front and middle portions of said barrel so that in said expanded position of said recoil spring said barrel protrudes with said gas exit openings beyond said flange arranged at the front end of said sleeve whereas when said recoil spring is compressed said openings communicate with said gas release chamber formed inside said sleeve.



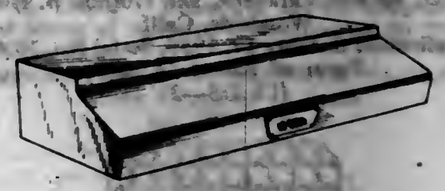
# DESIGNS

## NOVEMBER 20, 1956

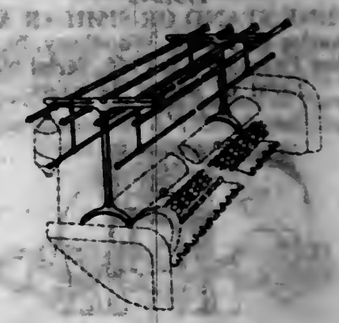
179,233
RING
Edward Abrams, Toronto, Ontario, Canada
Application January 30, 1956, Serial No. 39,960
Term of patent 14 years
(Cl. D45—10)



179,234
NURSING BOTTLE HOLDER
Paul B. Adee, Denver, Colo.
Application March 7, 1956, Serial No. 40,500
Term of patent 14 years
(Cl. D63—1)



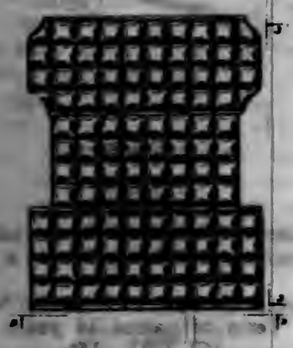
179,235
LEAFLET DISPENSING PULPIT
Gustave Edwin Anderson, La Crosse, Wis.
Application May 23, 1955, Serial No. 36,183
Term of patent 14 years
(Cl. D52—2)



179,236
MOTOR
Jacques Bernard, Paris, France, assignor to Societe Bernard-Moteurs, S. A., Paris, France, a society of France
Application March 22, 1956, Serial No. 40,736
Claims priority, application France October 19, 1955
Term of patent 7 years
(Cl. D77—1)

179,237
VENTILATING RANGE HOOD
Samuel M. Bernstein, Winnetka, Ill.
Application March 14, 1956, Serial No. 40,613
Term of patent 7 years
(Cl. D61—25)

179,238
LINT FREE CREEL
David L. Bohannon, Charlotte, N. C., assignor to Pennmill Corporation, Charlotte, N. C., a corporation of Delaware
Application August 24, 1955, Serial No. 37,640
Term of patent 14 years
(Cl. D92—15)

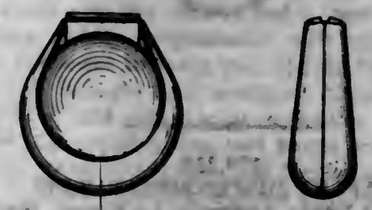


179,239
**BOBBIN HOLDER**
David L. Bohannon, Charlotte, N. C., assignor to Pneumatil Corporation, Charlotte, N. C., a corporation of Delaware
Application April 2, 1956, Serial No. 40,869
Term of patent 14 years
(Cl. D92—15)

179,240
**PAPER CLAMP OR THE LIKE**
Samuel Beker, Brooklyn, N. Y., assignor to Novo-Plas Manufacturing Co., Inc., Brooklyn, N. Y.
Application December 19, 1955, Serial No. 39,382
Term of patent 3½ years
(Cl. D74—2)

179,241
**INFLATABLE MATTRESS**
Edward D. Burton, Lafayette, and Gordon B. Holcombe, Woodside, Calif.
Application October 17, 1955, Serial No. 38,403
Term of patent 14 years
(Cl. D5—2)

179,242
**SHOE SHINE STAND OR SIMILAR ARTICLE**
Charles G. Dallas, Woodbury, N. J.
Application February 13, 1956, Serial No. 40,153
Term of patent 14 years
(Cl. D9—2)

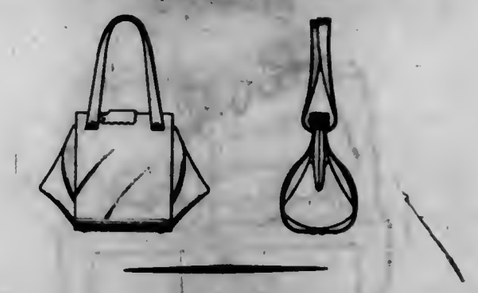


179,243
**DRINK MIXER**
Harry E. Dumon, Jr., Winchester, Mass.
Application November 16, 1955, Serial No. 38,914
Term of patent 14 years
(Cl. D44—1)

179,244
**LAMP PLANTER**
Elbert M. Dorman, Akron, Ohio
Application April 13, 1956, Serial No. 41,065
Term of patent 14 years
(Cl. D48—20)

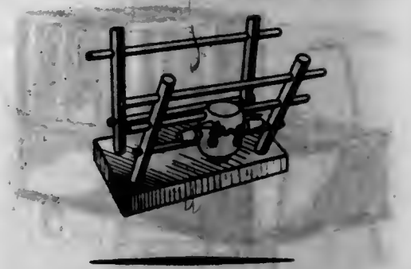
179,245
**ELECTRIC SHAVER**
Robert O. Ernest, Oak Park, Ill., assignor to Sunbeam Corporation, Chicago, Ill., a corporation of Illinois
Application September 13, 1955, Serial No. 37,968
Term of patent 14 years
(Cl. D22—3)

179,246
**GOLF CLUB HEAD**
John Warren Gillon, San Mateo, Calif.
Application January 23, 1956, Serial No. 39,874
Term of patent 14 years
(Cl. D34—5)



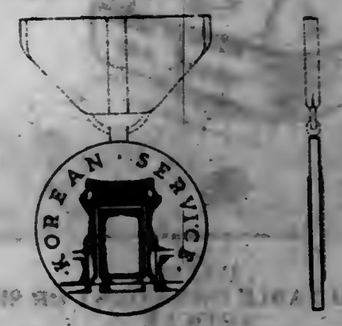
179,247
**INDOOR ANTENNA CABINET**
Henry D. Halperin, New York, N. Y., assignor to General Bronze Corporation, Garden City, N. Y., a corporation of New York
Application July 15, 1955, Serial No. 36,984
Term of patent 3½ years
(Cl. D26—14)

179,248
**HANDBAG**
William H. Hardy, River Edge, N. J.
Application July 31, 1956, Serial No. 42,466
Term of patent 3½ years
(Cl. D67—5)



179,249
**TOY BANK**
Walter F. Heat, Royal Oak, Mich.
Application July 22, 1955, Serial No. 37,093
Term of patent 14 years
(Cl. D34—11)

179,250
**GLOVE**
Julius A. Higier, Johnstown, N. Y.
Application June 19, 1956, Serial No. 41,963
Term of patent 7 years
(Cl. D3—11)



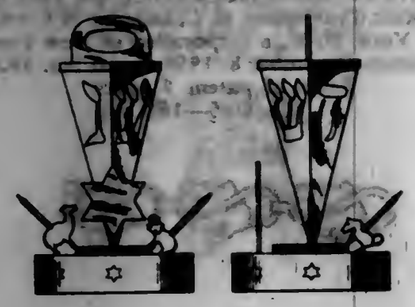
179,251
**NAPKIN HOLDER**
Severus Hilton, Wilton, Maine, assignor to Meneelik-Goldman Company, New York, N. Y., a partnership
Application July 16, 1956, Serial No. 42,286
Term of patent 3½ years
(Cl. D44—24)

179,252
**CHAIR**
James E. Jones, Toledo, Ohio, assignor to The Hettrick Manufacturing Company, Toledo, Ohio, a corporation of Ohio
Application May 18, 1955, Serial No. 36,061
Term of patent 14 years
(Cl. D15—1)

179,253
**MEDAL OR SIMILAR ARTICLE**
Thomas H. Jones, Washington, D. C., assignor to the United States of America as represented by the Secretary of the Army
Application January 27, 1956, Serial No. 39,954
Term of patent 14 years
(Cl. D29—19)

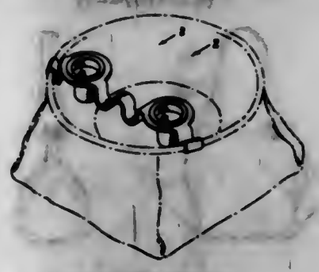
179,254
**LINK CHAIN FOR A NECKLACE OR THE LIKE**
Adolph Katz, Providence, R. I., assignor to Coro, Inc., New York, N. Y., a corporation of New York
Application December 8, 1955, Serial No. 39,229
Term of patent 7 years
(Cl. D45—16)

179,255
PHONOGRAPH CABINET
Harry C. Kline, Jr., Buffalo, N. Y., assignor to Wondt-Sparkrat, Inc., Cheektowaga, N. Y.
Application December 8, 1955, Serial No. 39,244
Term of patent 3½ years
(Cl. D56—4)



179,256
COMBINED CLOSURE CAP AND DISPENSING SPOUT
Harry A. Mart, Los Angeles, Calif.
Application January 24, 1955, Serial No. 34,160
Term of patent 14 years
(Cl. D58—26)

179,257
COMBINED SWING FAUCET AND DISHWASHING FIXTURE
Herbert Carvel Moore, West Los Angeles, Calif., assignor to Electro-Way Corporation, Los Angeles, Calif., a corporation
Application March 19, 1956, Serial No. 40,672
Term of patent 14 years
(Cl. D91—3)



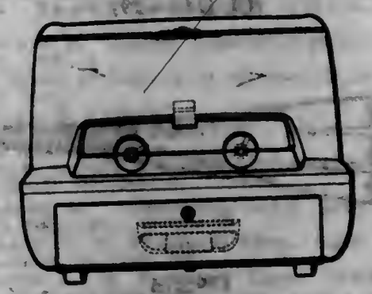
179,258
CHANUKAH TABLE ORNAMENT OR SIMILAR ARTICLE
Sara Rae Naimon, Milwaukee, Wis.
Application March 12, 1956, Serial No. 40,566
Term of patent 14 years
(Cl. D29—23)

179,259
PARTY CONFECTIONERY BASKET
Sara Rae Naimon, Milwaukee, Wis.
Application March 12, 1956, Serial No. 40,568
Term of patent 14 years
(Cl. D52—4)

179,260
COMBINED CIGARETTE HOLDER AND EXTINGUISHER ATTACHMENT FOR AN ASH TRAY OR SIMILAR ARTICLE
Donald J. O'Connor, East Hartford, Conn.
Application May 28, 1956, Serial No. 41,689
Term of patent 14 years
(Cl. D85—2)

179,261
COFFEE PERCOLATOR
Ernest H. Orr, Toronto, Ontario, Canada, assignor to Supreme Aluminum Industries Limited, Toronto, Ontario, Canada, a corporation
Application June 11, 1956, Serial No. 41,853
Term of patent 7 years
(Cl. D44—26)

179,262
WATCH OR SIMILAR ARTICLE
Heinz Pauli, Bettlach, Switzerland, assignor to Ed. Kummer S. A., Bettlach, Switzerland, a Swiss firm
Application November 25, 1955, Serial No. 39,037
Term of patent 3½ years
(Cl. D42—8)

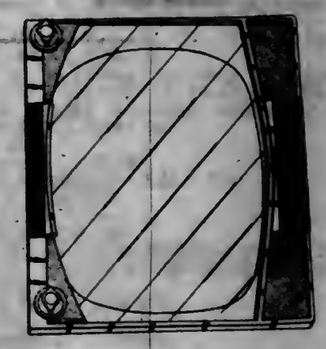


179,263
COMBINED BRUSH HOLDER AND MIRROR ATTACHMENT FOR SUN VISORS OR SIMILAR ARTICLE
Lester R. Pallet and Irving Mark, Chicago, Ill.
Application October 26, 1955, Serial No. 38,569
Term of patent 14 years
(Cl. D14—6)

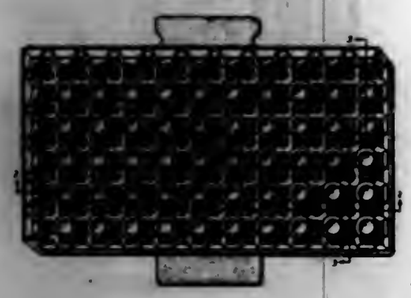
179,264
COMBINATION TOASTER AND OVEN OR SIMILAR ARTICLE
Paul O. Rawson, Jr., Trumbull, and John A. Russo, Bridgeport, Conn., assignors to General Electric Company, a corporation of New York
Application March 15, 1956, Serial No. 40,622
Term of patent 14 years
(Cl. D61—10)

179,265
CAN OPENER
Idus L. Rhodes, St. Louis, Mo., assignor to Swing-A-Way Manufacturing Company, St. Louis, Mo., a corporation of Missouri
Application April 8, 1955, Serial No. 35,426
Term of patent 14 years
(Cl. D22—2)

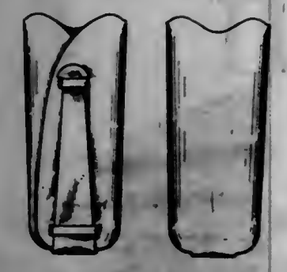
179,266
COMBINED CRASH PAD AND TRAY
Arthur Rich, Flushing, N. Y.
Application January 18, 1956, Serial No. 39,837
Term of patent 14 years
(Cl. D14—6)



179,267
EXHAUST EXTENSION
Lloyd E. Russell, Springfield, Ohio, assignor to Peters & Russell, Inc., Springfield, Ohio, a corporation of Ohio
Application April 5, 1954, Serial No. 29,868
Term of patent 14 years
(Cl. D14—6)

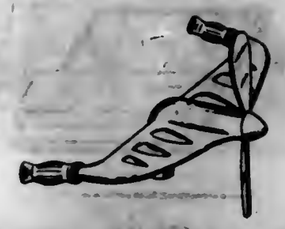


179,268
SWING-SHELF DISPLAY RACK OR THE LIKE
Charles F. Schaiper, Cincinnati, Ohio, assignor to The Coca-Cola Bottling Works Company, Cincinnati, Ohio, a corporation of Ohio
Application May 3, 1956, Serial No. 41,322
Term of patent 14 years
(Cl. D60—9)



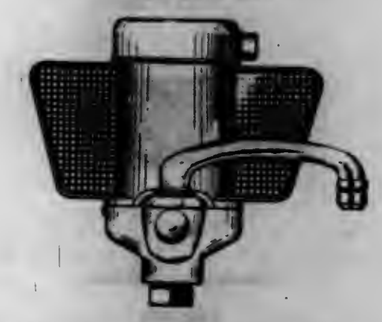
179,269
COMBINED ESCUTCHEON AND FACEPLATE FOR A TELEVISION RECEIVER CABINET
Kenneth P. Schory, Park Ridge, Ill., assignor to Zenith Radio Corporation, a corporation of Illinois
Application May 28, 1956, Serial No. 41,670
Term of patent 7 years
(Cl. D56—4)

179,270
**PACKING TRAY FOR LAMP BULBS**
Ernest L. Shepard, Fairfield, Maine, assignor to Keyes Fibre Company, Portland, Maine, a corporation of Maine
Application May 2, 1955, Serial No. 35,780
Term of patent 14 years
(Cl. D58—13)



179,271
**SPECTACLE CASE**
Raymond F. E. Stegeman, Greece, N. Y., assignor to Bausch & Lomb Optical Company, Rochester, N. Y., a corporation of New York
Application April 15, 1955, Serial No. 35,536
Term of patent 7 years
(Cl. D57—1)

179,272
**TILE OR SIMILAR ARTICLE**
Robert W. Sterrett, Park Ridge, Ill., assignor to Zonolite Company, Evanston, Ill., a corporation of Montana
Application May 14, 1956, Serial No. 41,485
Term of patent 14 years
(Cl. D18—2)



179,273
**TRICYCLE HANDLE-BAR OR SIMILAR ARTICLE**
Clifford Brooks Stevens, Milwaukee, Wis., assignor to Junior Toy Corporation, a corporation of Delaware
Application February 13, 1956, Serial No. 40,152
Term of patent 14 years
(Cl. D34—15)

179,274
**SALAD HANDLING IMPLEMENT OR THE LIKE**
Joseph B. Stier, New York, N. Y.
Application June 19, 1956, Serial No. 41,964
Term of patent 14 years
(Cl. D44—29)

179,275
**SINK ATTACHED DISHWASHER UNIT**
George William Walker, Bloomfield Hills, Mich., assignor to Gerity-Michigan Corporation, Adrian, Mich., a corporation of Michigan
Application January 13, 1956, Serial No. 39,756
Term of patent 14 years
(Cl. D91—3)

# LIST OF REISSUE PATENTEES

TO WHOM

## PATENTS WERE ISSUED ON THE 20TH DAY OF NOVEMBER, 1956

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

Stack, Vernon T., to Wilkes Hosiery Mills Co. stitch length control mechanism for knitting machines. Re. 24,239, 11–20–56, Cl. 66—55.

Wilkes Hosiery Mills Co.: *See*— Stack, Vernon T. Re. 24,239.

# LIST OF PLANT PATENTEES

Begonia, Paul B., to Germain's, Inc. Rose plant. 1,528, 11–20–56, Cl. 47—61.

Boerner, Eugene S., to C. W. Stuart & Co. Rose plant. 1,529, 11–20–56, Cl. 47—61.

Germain's, Inc.: *See*— Begonia, Paul B. 1,528.

Stuart, C. W., & Co.: *See*— Boerner, Eugene S. 1,529.

# LIST OF DESIGN PATENTEES

Abrams, Edward. Ring. 179,233, 11–20–56, Cl. D45—10.

Aden, Paul B. Nursing bottle holder. 179,234, 11–20–56, Cl. D83—1.

Anderson, Gustave E. Leaflet dispensing pulpit. 179,235, 11–20–56, Cl. D52—2.

Army, United States of America as represented by the Secretary of the: *See*— Jones, Thomas H. 179,253.

Bausch & Lomb Optical Co.: *See*— Stegeman, Raymond F. E. 179,271.

Bernard, Jacques, to Society Bernard-Moteurs, S. A. Motor. 179,236, 11–20–56, Cl. D77—1.

Bernstein, Samuel M. Ventilating range hood. 179,237, 11–20–56, Cl. D61—25.

Bohannon, David L., to Pneumafil Corp. Lint free creel. 179,238, 11–20–56, Cl. D92—15.

Bohannon, David L., to Pneumafil Corp. Bobbin holder. 179,239, 11–20–56, Cl. D92—15.

Boker, Samuel, to Novo-Plas Mfg. Co., Inc. Paper clamp or the like. 179,240, 11–20–56, Cl. D74—2.

Burton, Edward D., and G. B. Holcombe. Inflatable mattress. 179,241, 11–20–56, Cl. D5—2.

Coca-Cola Bottling Works Co., The: *See*— Schaiper, Charles F. 179,268.

Coro, Inc.: *See*— Katz, Adolph. 179,254.

Dallas, Charles G. Shoe shine stand or similar article. 179,242, 11–20–56, Cl. D9—2.

Damon, Harry E., Jr. Drink mixer. 179,243, 11–20–56, Cl. D44—1.

Dorman, Elbert M. Lamp planter. 179,244, 11–20–56, Cl. D48—20.

Electro-Way Corp.: *See*— Moore, Herbert C. 179,257.

Ernest, Robert O., to Sunbeam Corp. Electric shaver. 179,245, 11–20–56, Cl. D22—3.

General Bronze Corp.: *See*— Halperin, Henry D. 179,247.

General Electric Co.: *See*— Rawson, Paul O., Jr., and Russo. 179,264.

Gerity-Michigan Corp.: *See*— Walker, George W. 179,275.

Gillon, John W. Golf club head. 179,246, 11–20–56, Cl. D34—5.

Halperin, Henry D., to General Bronze Corp. Indoor antenna cabinet. 179,247, 11–20–56, Cl. D26—14.

Hardy, William H. Handbag. 179,248, 11–20–56, Cl. D87—5.

Hess, Walter F. Toy bank. 179,249, 11–20–56, Cl. D34—11.

Hettrick Mfg. Co., The: *See*— Jones, James E. 179,252.

Higier, Julius A. Glove. 179,250, 11–20–56, Cl. D3—11.

Hilton, Severns, to Menschik-Goldman Co. Napkin holder. 179,251, 11–20–56, Cl. D44—24.

Holcombe, Gordon B.: *See*— Burton, Edward D., and Holcombe. 179,241.

Jones, James E., to The Hettrick Mfg. Co. Chair. 179,252. 11–20–56, Cl. D15—1.

Jones, Thomas H., to the United States of America as represented by the Secretary of the Army. Medal or similar article. 179,253, 11–20–56, Cl. D29—19.

Junior Toy Corp.: *See*— Stevens, Clifford B. 179,273.

Katz, Adolph, to Coro, Inc. Link chain for a necklace or the like. 179,254, 11–20–56, Cl. D45—16.

Keyes Fibre Co.: *See*— Shepard, Ernest L. 179,270.

Kline, Harry C., Jr., to Wendt-Squires, Inc. Phonograph cabinet. 179,255, 11–20–56, Cl. D86—4.

Kummer, Ed., S. A.: *See*— Pauli, Heins. 179,262.

Mark, Irving: *See*— Pellet, Lester R., and Mark. 179,263.

Mart, Harry A. Combined closure cap and dispensing spout. 179,256, 11–20–56, Cl. D58—26.

Menschik-Goldman Co.: *See*— Hilton, Severns. 179,251.

Moore, Herbert C., to Electro-Way Corp. Combined swing faucet and dishwashing fixture. 179,257, 11–20–56, Cl. D91—3.

Naimon, Sara R. Chanukah table ornament or similar article. 179,258, 11–20–56, Cl. D29—23.

Naimon, Sara R. Party confectionery basket. 179,259, 11–20–56, Cl. D58—4.

Novo-Plas Mfg. Co., Inc.: *See*— Boker, Samuel. 179,240.

O'Connor, Donald J. Combined cigarette holder and extinguisher attachment for an ash tray or similar article. 179,260, 11–20–56, Cl. D85—2.

Orr, Ernest H., to Supreme Aluminum Industries Ltd. Coffee percolator. 179,261, 11–20–56, Cl. D44—26.

Pauli, Heins, to Ed. Kummer S. A. Watch or similar article. 179,262, 11–20–56, Cl. D42—6.

Pellet, Lester R., and I. Mark. Combined brush holder and mirror attachment for sun visors or similar article. 179,263, 11–20–56, Cl. D14—6.

Peters & Russell, Inc.: *See*— Russell, Linus E. 179,267.

Pneumafil Corp.: *See*— Bohannon, David L. 179,238. Bohannon, David L. 179,239.

Rawson, Paul O., Jr., and J. A. Russo, to General Electric Co. Combination toaster and oven or similar article. 179,264, 11–20–56, Cl. D61—10.

Rhodes, Idus L., to Swing-A-Way Mfg. Co. Can opener. 179,265, 11–20–56, Cl. D22—2.

Rich, Arthur. Combined crash pad and tray. 179,266, 11–20–56, Cl. D14—6.

Russell, Linus E., to Peters & Russell, Inc. Exhaust extension. 179,267, 11–20–56, Cl. D14—6.

Russo, John A.: *See*— Rawson, Paul O., Jr., and Russo. 179,264.

Schaiper, Charles F., to The Coca-Cola Bottling Works Co. Swing-shelf display rack or the like. 179,268, 11–20–56, Cl. D60—9.

Schory, Kenneth P., to Zenith Radio Corp. Combined escutcheon and faceplate for a television receiver cabinet. 179,269, 11–20–56, Cl. D56—4.

Shepard, Ernest L., to Keyes Fibre Co. Packing tray for lamp bulbs. 179,270, 11–20–56, Cl. D58—13.

Society Bernard-Moteurs, S. A.: *See*— Bernard, Jacques. 179,236.

Stegeman, Raymond F. E., to Bausch & Lomb Optical Co. Spectacle case. 179,271, 11–20–56, Cl. D57—1.

Sterrett, Robert W., to Zonolite Co. Tile or similar article. 179,272, 11–20–56, Cl. D18—2.

Stevens, Clifford B., to Junior Toy Corp. Tricycle handle-bar or similar article. 179,273, 11–20–56, Cl. D34—15.

Stier, Joseph B. Salad handling implement or the like. 179,274, 11–20–56, Cl. D44—29.

Sunbeam Corp.: *See*— Ernest, Robert O. 179,245.

Supreme Aluminum Industries Ltd.: *See*— Orr, Ernest H. 179,261.

Swing-A-Way Mfg. Co.: *See*— Rhodes, Idus L. 179,265.

Walker, George W., to Gerity-Michigan Corp. Sink attached dishwasher unit. 179,275, 11–20–56, Cl. D91—3.

Wendt-Squires, Inc.: *See*— Kline, Harry C., Jr. 179,255.

Zenith Radio Corp.: *See*— Schory, Kenneth P. 179,269.

Zonolite Co.: *See*— Sterrett, Robert W. 179,272.

# LIST OF PATENTEES

TO WHOM

## PATENTS WERE ISSUED ON THE 20TH DAY OF NOVEMBER, 1956

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

AB Svenska Flaktfabriken: *See*—
Larsson, Gustaf. 2,771,266.

APRA Precipitator Corp.: *See*—
Welts, Jeremy. 2,771,150.

Abs, Alfred J.: *See*—
Barnett, Arthur R., Suter, and Abs. 2,770,887.

Achilles, Werner. Apparatus for felling backings. 2,771,120, 11–20–56, Cl. 154—37.

Achtsig, Christoph, to Porzellanfabrik Weiden Gebrueder Bauscher, Zweigniederlassung der Lorenz Hutschenreuther Aktiengesellschaft in Selb. Cup with handle. 2,770,956, 11–20–56, Cl. 63—13.

Adams, Frank R. Polarized self-neutralizing servomotor. 2,771,572, 11–20–56, Cl. 317—172.

Adams, Madonna R.: *See*—
Shirmeyer, Maxine R., and Adams. 2,771,061.

Adlaf, William J., to Boyar-Schultz Corp. Lead screw taping attachment having torque responsive feed nut. 2,770,821, 11–20–56, Cl. 10—135.

Aerosquip Corp.: *See*—
Horrell, Maurice W. 2,771,555.

Afferbaugh, Merle F. Method of packaging ice cream and container therefor. 2,771,369, 11–20–56, Cl. 99—180.

Agriculture, United States of America as represented by the Secretary of: *See*—
Benedict, Robert G., and Stodola. 2,771,397.

Air Force, United States of America as represented by the Secretary of the: *See*—
Stolzenbach, Robert W. 2,771,581.

Aktiebolaget B. A. Hjorth & Co.: *See*—
Gustavsson, Karl A. G. 2,771,157.

Aktiebolaget Bofors: *See*—
Blomqvist, Åke H. P., and Lindegren. 2,771,573.

Aktiengesellschaft Brown, Boveri & Cie: *See*—
Stoecklin, Josef, and Lura. 2,771,523.

Alco Valve Co.: *See*—
Schenk, John A. 2,771,062.

Alcott, David W.: *See*—
Cole, Herbert M., and Alcott. 2,771,541.

All American Engineering Co.: *See*—
Doolittle, Donald B. 2,771,128.
Doolittle, Donald B. 2,771,257.

Allbright, Dennis H. to Dunlop Rubber Co. Ltd. Locking mechanism for fluid pressure operated devices. 2,771,060, 11–20–56, Cl. 121—40.

Allegretti, Dante M., and L. P. Brunette. Adjustable control ring. 2,770,889, 11–20–56, Cl. 33—214.

Allen, Clyde H. French fried onion rings and the method of making same. 2,771,370, 11–20–56, Cl. 99—193.

Allied Chemical & Dye Corp.: *See*—
Hennig, Ralph R. 2,771,153.
Weinstock, Harry H., Jr. 2,771,461.

Allied Laboratories, Inc.: *See*—
Bockstahler, Earl R. 2,771,391.

Allis-Chalmers Mfg. Co.: *See*—
Ferguson, Rector C. 2,771,017.
Hansen, Alfred J. 2,770,997.

Alric, Gustave. Fuel injectors. 2,771,321, 11–20–56, Cl. 239—107.6.

Altman, Harry: *See*—
Levine, Arnold M., and Altman. 2,771,507.

Ambrose, Paul E.: *See*—
Bader, Harry F., Barth, and Ambrose. 2,770,808.

American Air Filter Co., Inc.: *See*—
Gonzales, Don J. 2,771,154.
Palmore, Robert A. 2,771,155.

American Bosch Arma Corp.: *See*—
Bischoff, Waldemar O. 2,771,066.

American Cyanamid Co.: *See*—
Hastings, Randall, Drechsel, and Strasdins. 2,771,464.
Stoddard, Edgar A., Jr., and Williams. 2,771,490.
Tanner, Charles A., Jr. 2,771,345.

American Hardware Corp., The: *See*—
Bigelow, Lyford C. 2,770,964.

American Home Products Corp.: *See*—
Chase, Fletcher A., and Laursen. 2,771,364.

American Machine & Foundry Co.: *See*—
Kottmann, Arthur A. 2,770,934.

American Mattress Co.: *See*—
Cash, James A., Jr. 2,771,045.

American Permanent Wear Co.: *See*—
McGinley, William L. 2,771,332.

American Radiator & Standard Sanitary Corp.: *See*—
Tinker, Townsend. 2,771,290.

American Telephone and Telegraph Co.: *See*—
Morris, Richard S., Jr. 2,771,511.

American Viscose Corp.: *See*—
Messmer, Robert C. 2,771,182.

Anderson, Arthur J., to General Motors Corp. Supporting shell molds during metal pouring operations. 2,770,858, 11–20–56, Cl. 22—90.

Anderson, Gordon C., and P. B. West, to Saco-Lowell Shops. Tube gear for sliver oilers. 2,770,845, 11–20–56, Cl. 19—159.

Anderson, William A., and C. W. Harrison, to Bell Telephone Laboratories, Inc. Saw-tooth generator. 2,771,556, 11–20–56, Cl. 250—36.

Andis Clipper Co.: *See*—
Andis, Mathew. 2,771,280.

Andis, Mathew, to Andis Clipper Co. Triturating and mixing machine. 2,771,280, 11–20–56, Cl. 259—108.

Andres, Lloyd J., to Permo, Inc. Stylus and socket therefor. 2,771,295, 11–20–56, Cl. 274—37.

Angelici, Wilbert W., and R. T. Miller. Retractable ball-type castering device. 2,770,831, 11–20–56, Cl. 16—24.

Annen, James E., to Sutherland Paper Co. Dispensing cartons provided with cutters. 2,771,185, 11–20–56, Cl. 206—58.

Anthony, Theodore: *See*—
Elser, Philip, Sommerfeld, and Anthony. 2,770,805.

Antonsen, Randolph: *See*—
Bray, Richard L., and Antonsen. 2,771,158.

Applebaum, Norman L.: *See*—
Landsperger, Christian, and Applebaum. 2,771,074.

Armstrong Cork Co.: *See*—
Schneider, Charles F., and Turkington. 2,771,246.

Army, United States of America as represented by the Secretary of the: *See*—
Brown, James W., and Weintraub. 2,771,217.
MacCaffray, Rex S. 2,771,121.
Snyder, Thomas L. 2,771,396.

Arnold, Orlan M., and R. M. Jamison, to Olin Mathieson Chemical Corp. Method for stabilizing hydrazine against decomposition by copper in contact therewith. 2,771,343, 11–20–56, Cl. 23—190.

Arundale, Erving: *See*—
Banes, Fred W., and Arundale. 2,771,459.

Ash, Charles S. Four-wheel driven tractor. 2,771,147, 11–20–56, Cl. 180—49.

Ash, Charles S. Power-actuated laterally and vertically adjustable draft means. 2,771,806, 11–20–56, Cl. 280—456.

Ateliers de Constructions Electriques de Charleroi: *See*—
Coquelet, Jules. 2,771,506.

Ateliers de Construction Oerlikon: *See*—
Morcillon, Raymond. 2,771,259.

Audrieth, Ludwig F., and E. S. Scott, to University of Illinois Foundation, Chemical Process. 2,771,489, 11–20–56, Cl. 260—552.

Aust, Joseph B.: *See*—
Van Ormer, William K., and Aust. 2,770,928.

Automatic Electric Laboratories, Inc.: *See*—
Ostline, John E. 2,771,510.

Avco Mfg. Corp.: *See*—
Jansen, Robert A. 2,770,954.

Avertisseurs Routiers Silencieux: *See*—
Gourdou, Charles. 2,771,594.

Avery, Harold T.: *See*—
Nolde, George V., and Avery. 2,771,599.

Avery, Harold T., and R. W. Hampton, to Marchant Research, Inc. Readout devices. 2,771,505, 11–20–56, Cl. 178—23.

Babcock & Wilcox Co., The: *See*—
Koolstra, Lambert F., and Cobb. 2,771,460.

Babel, Paul V., to International Business Machines Corp. Record controlled punch with provision for serial numbering. 2,771,137, 11–20–56, Cl. 164—115.

Babunovic, Momir, and N. D. Dalton, to Quirk Machinery Co. Cutter for woodworking machine. 2,771,108, 11–20–56, Cl. 144—229.

Bachman, George S.: *See*—
Fitzgerald, John V., and Bachman. 2,770,922.

Bader, Harry F., H. J. Barth, and P. E. Ambrose. Deposited rubber undergarment with variegated surfaces. 2,770,808, 11–20–56, Cl. 2—37.

Badin, Ferdinand. Centrifugal powder clutches. 2,771,170, 11–20–56 Cl. 192—58.

Badische Anilin- & Soda-Fabrik Aktiengesellschaft: *See*—
Reppe, Walter, Friederich, and Wiebusch. 2,771,478.

Baes, Guillermo F. Rotary pumps and the like. 2,771,036, 11–20–56, Cl. 103—90.

Bailey, William D., and J. T. Cooper. Suction and pressure controlled valve system. 2,771,094, 11–20–56, Cl. 137—620.

Baker, James G., to The Perkin-Elmer Corp. Objectives comprising two outer positive doublets enclosing a middle negative component for aerial photography. 2,771,007, 11–20–56, Cl. 88—57.

Baker Oil Tools, Inc.: *See*—
Baker, Reuben C., and Ragan. 2,771,091.

Baker, Reuben C., and T. M. Ragan, to Baker Oil Tools, Inc. Drill pipe float valve. 2,771,091, 11–20–56, Cl. 137—542.

Baldridge, Byron C.: *See*—
Holmes, Raymond S., Baldridge, O'Neill, and Silk. 2,771,851.

Baldridge, Byron C., to Olin Mathieson Chemical Corp. Explosive. 2,771,350, 11–20–56, Cl. 52—6.1.

Baldwin-Lima-Hamilton Corp.: *See*—
Ruge, Arthur C. 2,771,579.

Ballard, Sam L. Pipe bending machine for industrial piping. 2,771,116, 11–20–56, Cl. 153—48.

Banes, Fred W., and E. Arundale, to Esso Research and Engineering Co. Cationic derivatives of itaconate-diene copolymers. 2,771,459, 11–20–56, Cl. 260—72.6.

Barnacket, Albert J., to International Telephone and Telegraph Corp. Cathode ray electron discharge device. 2,771,566, 11–20–56, Cl. 315—16.

Barclay, Harry A., and D. P. Nichols, to Socony Mobil Oil Co., Inc. Subsurface igniter. 2,771,140, 11–20–56, Cl. 166—60.

Barkelew Electric Mfg. Co., The: *See*—
Stevens, Arthur M. 2,771,520.

Barker, Sydney W., to Lastrafil Ltd. Apparatus for treating threads. 2,771,180, 11–20–56, Cl. 202—65.

Barnes, Arthur W., R. S. Dyer, and A. A. Gibson, to Imperial Chemical Industries Ltd. Production of vinyl chloride polymers. 2,771,457, 11–20–56, Cl. 260—92.8.

Barnett, Arthur R., O. Suter, and A. J. Abs, to Technical Oil Tool Corp., Ltd. Directional inclination recording apparatus. 2,770,887, 11–20–56, Cl. 33—206.5.

Baton, Charlotte M. Rocking bed structure and synchronized respirator. 2,771,089, 11–20–56, Cl. 128—29.

Baroni, Francisco J. L. Blind for straight openings. 2,771,134, 11–20–56, Cl. 160—115.

Barth, Harry J.: *See*—
Bader, Harry F., Barth, and Ambrose. 2,770,808.

Barth, Otto F. F., to Hoganäs-Billesholms Aktiebolag. Method for gaining vanadium values from vanadium containing iron ores. 2,771,341, 11–20–56, Cl. 23—51.

Bass, Charles S. Agricultural disc sharpener. 2,770,986, 11–20–56, Cl. 76—89.2.

Bates, Lawrence G., to Continental Say-When Corp. Universal liquid dispenser. 2,771,226, 11–20–56, Cl. 222—401.

Bauman, William C.: *See*—
Simpson, Donald W., and Bauman. 2,771,193.

Baxter Filtration Corp.: *See*—
Baxter, Thomas D., and McIntyre. 2,771,194.

Baxter, Thomas D., and A. A. McIntyre, to Baxter Filtration Corp. Method of filtering. 2,771,194, 11–20–56, Cl. 210—150.

Beal, Philip F.: *See*—
Hogg, John A., Beal, Nathan, and Lincoln. 2,771,475.

Beale, Evelyn S. L., to Alan Muntz & Co. Ltd. Turbines operated by free-piston gas generators. 2,770,943, 11–20–56, Cl. 60—13.

Beck, Curt E., and C. A. Stokes, to Godfrey L. Cabot, Inc. Densification of ink grade carbon blacks. 2,771,347, 11–20–56, Cl. 23—314.

Beckadolph, Richard, and W. Niclas, to Continental Gummi-Werke Aktiengesellschaft. Belt transmissions. 2,770,977, 11–20–56, Cl. 74—229.

Becker, Adam W., and A. W. Weker, to the United States of America as represented by the United States Atomic Energy Commission. Crucible and stopper therefor. 2,770,856, 11–20–56, Cl. 22—57.

Beeson, Donald M., to Esso Research and Engineering Co. Waterflooding method of secondary recovery. 2,771,138, 11–20–56, Cl. 166—9.

Bell, Elva L. Securing strip. 2,771,165, 11–20–56, Cl. 189—76.

Bell, John F., and R. M. Nordby, to Zenith Radio Corp. Multiband frequency selector and frequency converter. 2,771,547, 11–20–56, Cl. 250—20.

Bell Telephone Laboratories, Inc.: *See*—
Anderson, William A., and Harrison. 2,771,556.
Dudley, Homer W., and Harris. 2,771,509.
Fuller, Calvin S. 2,771,382.
Harrison, Charles W., and Nielsen. 2,771,517.
King, John H., and Kleinfelder. 2,771,502.
Mesmaros, George W. 2,771,576.
Nance, Robert C. 2,771,519.
Schott, John T. 2,771,580.
Thomas, Donald E. 2,771,584.

Bellamy, John C., to Cook Electric Co. Method and apparatus for recording and reproducing data. 2,771,596, 11–20–56, Cl. 340—177.

Bellio, Louis M. Safety switch assembly. 2,771,532, 11–20–56, Cl. 200—168.

Bellon, François B., and J. L. M. H. Lenoir. Magnetic element for apparatus designed to determine the direction of a magnetic field. 2,770,890, 11–20–56, Cl. 33—222.

Bendix Aviation Corp.: *See*—
Farron, John R. 2,771,061.
Kasten, Walter, and Rohs. 2,771,156.
Polye, William R. 2,770,932.

Benedict, Robert G., and F. H. Stodola, to the United States of America as represented by the Secretary of Agriculture. Antibiotic and method for producing it by Bacillus polymyxa. 2,771,397, 11–20–56, Cl. 195—96.

Berg, Elmer W., and E. J. Johnston, to International Harvester Co. Power actuated reel operating means. 2,770,939, 11–20–56, Cl. 56—222.

Berger, Donald E.: *See*—
Miller, Elmer C., and Berger. 2,771,149.

Bergstrand, Richard H., to The Moline Tool Co. Transfer tables. 2,771,172, 11–20–56, Cl. 198—19.

Bernstein, Nahum A.: *See*—
Zepelovitch, Nathan. 2,771,205.

Beryllium Corp., The: *See*—
Morana, Simon J. 2,771,339.

Best, Stanley G., Jr., to United Aircraft Corp. Emergency fuel control system. 2,771,130, 11–20–56, Cl. 158—36.3.

Bieber, Theodore I. Method of preparing alkyl isocyanates from inorganic cyanates. 2,771,483, 11–20–56, Cl. 260—453.

Biefeld, Lawrence P., and R. F. Shannon, to Owens-Corning Fiberglas Corp. Method for producing molded products comprising melamine formaldehyde resin and gypsum. 2,770,840, 11–20–56, Cl. 18—47.5.

Bigelow, Lyford C., to The American Hardware Corp. Adapter housing for door locks. 2,770,964, 11–20–56, Cl. 70—451.

Binder, George G., Jr.: *See*—
Johnso, Edward F., and Binder. 2,771,139.

Bing, John H.: *See*—
Collins, William F., and Bing. 2,771,206.

Birch, Stanley F., T. V. Cullum, and R. A. Dean, to The British Petroleum Co. Ltd. Hypochlorite process for the treatment of petroleum distillates. 2,771,402, 11–20–56, Cl. 196—29.

Bird, Alyce L. Combination can opener and measuring cup. 2,770,877, 11–20–56, Cl. 30—123.

Bird & Son, Inc.: *See*—
Wright, William R. 2,770,847.

Birdseye, Clarence, and H. D. Stuck, to Process Evaluation and Development Corp. Dehbration processes. 2,771,361, 11–20–56, Cl. 92—1.

Bischoff, Waldemar O., to American Bosch Arma Corp. Fuel injection pump. 2,771,066, 11–20–56, Cl. 123—139.

Bissell Carpet Sweeper Co.: *See*—
Pullen, Fred W. 2,770,825.

Blake, Nicholas M. Closure fastener. 2,771,313, 11–20–56, Cl. 292—142.

Blake, Thomas G., to Olin Mathieson Chemical Corp. Blasting cap. 2,771,034, 11–20–56, Cl. 102—28.

Blaser, Bruno, and G. Tischbirek, to Henkel & Cie. G. m. b. H. Sulfonation of organic hydroxy compounds. 2,771,464, 11–20–56, Cl. 260—459.

Bloch, Alfred, to Hazeltine Research, Inc. Differential repeater system. 2,771,583, 11–20–56, Cl. 324—122.

Bloch, Herman S., to Universal Oil Products Co. Insecticidal compounds. 2,771,479, 11–20–56, Cl. 260—407.

Blomqvist, Åke H. P., and P. A. Lindegren, to Aktiebolaget Bofors. Remote control follow-up system for positioning a controlled unit by a control unit. 2,771,573, 11–20–56, Cl. 318—30.

Blue, John, Co. Inc.: *See*—
Johnston, Douglas. 2,771,037.

Bobkowicz, Emilian. Method and apparatus for making unwoven fabric from bast fibers. 2,771,118, 11–20–56, Cl. 154—1.75.

Bockstahler, Earl R., to Allied Laboratories, Inc. Physiologically active p-alkoxy-beta-piperidinopropiophenones causing cns depressant and anesthetic effects in animals. 2,771,391, 11–20–56, Cl. 167—53.

Boerger, Earl A. Hand carried liquid dispenser. 2,771,224, 11–20–56, Cl. 222—210.

Boho, Lawrence M. Movable bracket for can openers and the like. 2,771,263, 11–20–56, Cl. 248—298.

Boice, Lendall O. Vulcanising machine. 2,770,839, 11–20–56, Cl. 18—18.

Boisson, Pierre, to Societe Metallurgique Ariegeoise et Lorraine. Mould for the centrifugal casting of pipes and other pieces. 2,770,857, 11–20–56, Cl. 22—65.

Bologna, Louis. Wire cutting and stripping tool. 2,770,969, 11–20–56, Cl. 81—9.5.

Bolt, John A.: *See*—
Kalinowski, Mathew L., and Bolt. 2,771,405.

Booth, James H., and A. W. Gair, to Thompson Products, Inc. Sectionalised steering knuckle. 2,771,301, 11–20–56, Cl. 280—96.2.

Booth, James H., and A. W. Gair, to Thompson Products, Inc. Steering arm, spindle, and support bridge assembly. 2,771,302, 11–20–56, Cl. 280—96.2.

Borden, Joseph H., and H. F. Vlasak, to Haughton Elevator Co. Means for distributing elevator service according to demand. 2,771,160, 11–20–56, Cl. 187—29.

Borg-Warner Corp.: *See*—
Selberg, John P., and Currie. 2,771,270.

Borsani, Osvaldo. Divan with independently adjustable back and seat. 2,771,124, 11–20–56, Cl. 155—118.

Bosong-Werk G. m. b. H.: *See*—

De Groote, Melvin, to Petrolite Corp. Process for breaking petroleum emulsions employing certain amine-modified thermoplastic phenol-aldehyde resin salts. 2,771,441, 11–20–56, Cl. 252—341.

De Groote, Melvin, to Petrolite Corp. Process for breaking petroleum emulsions employing certain amine-modified thermoplastic phenol-aldehyde resin salts. 2,771,442, 11–20–56, Cl. 252—341.

De Groote, Melvin, to Petrolite Corp. Process for breaking petroleum emulsions employing certain amine-modified thermoplastic phenol-aldehyde resin salts. 2,771,443, 11–20–56, Cl. 252—341.

De Groote, Melvin, to Petrolite Corp. Process for breaking petroleum emulsions employing certain amine-modified thermoplastic phenol-aldehyde resin salts. 2,771,444, 11–20–56, Cl. 252—341.

De Groote, Melvin, to Petrolite Corp. Process for breaking petroleum emulsions employing gluconic acid salts of oxyalkylated amine-modified thermoplastic phenol-aldehyde resins. 2,771,445, 11–20–56, Cl. 252—341.
2,771,445, 11–20–56, Cl. 252—341.

De Groote, Melvin, to Petrolite Corp. Process for breaking petroleum emulsions employing gluconic acid salts of oxyalkylated amine-modified thermoplastic phenol-aldehyde resins. 2,771,446, 11–20–56, Cl. 252—341.

De Groote, Melvin, to Petrolite Corp. Process for breaking petroleum emulsions employing gluconic acid salts of oxyalkylated amine-modified thermoplastic phenol-aldehyde resins. 2,771,447, 11–20–56, Cl. 252—341.

De Groote, Melvin, to Petrolite Corp. Process for breaking petroleum emulsions employing gluconic acid salts of oxyalkylated amine-modified thermoplastic phenol-aldehyde resins. 2,771,448, 11–20–56, Cl. 252—341.

De Groote, Melvin, to Petrolite Corp. Process for breaking petroleum emulsions employing gluconic acid salts of oxyalkylated amine-modified thermoplastic phenol-aldehyde resins. 2,771,449, 11–20–56, Cl. 252—341.

De Groote, Melvin, to Petrolite Corp. Polycarboxy acid esters of oxypropylated hexides. 2,771,471, 11–20–56, Cl. 260—347.4.

De Groote, Melvin, and K.-T. Shen, to Petrolite Corp. Process for breaking petroleum emulsions employing certain polyepoxide treated derivatives obtained by reaction of monoepoxides with resins. 2,771,430, 11–20–56, Cl. 252—338.

De Groote, Melvin, and K.-T. Shen, to Petrolite Corp. Process for breaking petroleum emulsions employing certain polyepoxide treated derivatives obtained by reaction of monoepoxides with resins. 2,771,431, 11–20–56, Cl. 252—338.

De Groote, Melvin, and K.-T. Shen, to Petrolite Corp. Process for breaking petroleum emulsions employing certain polyepoxide treated derivatives obtained by reaction of monoepoxides with resins. 2,771,432, 11–20–56, Cl. 252—338.

De Groote, Melvin, and K.-T. Shen, to Petrolite Corp. Process for breaking petroleum emulsions employing certain polyepoxide treated derivatives obtained by reaction of monoepoxides with resins. 2,771,432, 11-20-56, Cl. 252—328.

De Groote, Melvin, and K.-T. Shen, to Petrolite Corp. Process for breaking petroleum emulsions employing certain polyepoxide treated derivatives obtained by reaction of monoepoxides with resins. 2,771,434, 11-20-56, Cl. 252—328.

De Groote, Melvin, and K.-T. Shen, to Petrolite Corp. Process for breaking petroleum emulsions employing certain oxyalkylated polyepoxide-treated amine-modified thermoplastic phenol-aldehyde resins. 2,771,425, 11-20-56, Cl. 252—338.

De Groote, Melvin, and K.-T. Shen, to Petrolite Corp. Process for breaking petroleum emulsions employing certain oxyalkylated polyepoxide-treated amine-modified thermoplastic phenol-aldehyde resins. 2,771,426, 11-20-56, Cl. 252—338.

De Groote, Melvin, and K.-T. Shen, to Petrolite Corp. Process for breaking petroleum emulsions employing certain oxyalkylated polyepoxide-treated amine-modified thermoplastic phenol-aldehyde resins. 2,771,427, 11-20-56, Cl. 252—338.

De Groote, Melvin, and K.-T. Shen, to Petrolite Corp. Process for breaking petroleum emulsions employing certain oxyalkylated polyepoxide-treated amine-modified thermoplastic phenol-aldehyde resins. 2,771,428, 11-20-56, Cl. 252—338.

De Groote, Melvin, and K.-T. Shen, to Petrolite Corp. Process for breaking petroleum emulsions employing certain oxyalkylated polyepoxide-treated amine-modified thermoplastic phenol-aldehyde resins. 2,771,429, 11-20-56, Cl. 252—338.

De Groote, Melvin, and K.-T. Shen, to Petrolite Corp. Process for breaking petroleum emulsions employing certain polyepoxide treated amine-modified thermoplastic phenol-aldehyde resins. 2,771,435, 11-20-56, Cl. 252—338.

De Groote, Melvin, and K.-T. Shen, to Petrolite Corp. Process for breaking petroleum emulsions employing certain polyepoxide treated amine-modified thermoplastic phenol-aldehyde resins. 2,771,436, 11-20-56, Cl. 252—338.

De Groote, Melvin, and K.-T. Shen, to Petrolite Corp. Process for breaking petroleum emulsions employing certain polyepoxide treated amine-modified thermoplastic phenol-aldehyde resins. 2,771,437, 11-20-56, Cl. 252—338.

De Groote, Melvin, and K.-T. Shen, to Petrolite Corp. Process for breaking petroleum emulsions employing certain polyepoxide treated amine-modified thermoplastic phenol-aldehyde resins. 2,771,438, 11-20-56, Cl. 252—338.

De Groote, Melvin, and K.-T. Shen, to Petrolite Corp. Process for breaking petroleum emulsions employing certain polyepoxide treated amine-modified thermoplastic phenol-aldehyde resins. 2,771,439, 11-20-56, Cl. 252—338.

De Groote, Melvin, and K.-T. Shen, to Petrolite Corp. Process for breaking petroleum emulsions, certain oxyalkylated polyepoxide-treated amine-modified thermoplastic phenol-aldehyde resins and method of making same. 2,771,451, 11-20-56, Cl. 252—344.

De Groote, Melvin, and K.-T. Shen, to Petrolite Corp. Process for breaking petroleum emulsions, certain oxyalkylated polyepoxide-treated amine-modified thermoplastic phenol-aldehyde resins and method of making same. 2,771,452, 11-20-56, Cl. 252—344.

De Groote, Melvin, and K.-T. Shen, to Petrolite Corp. Process for breaking petroleum emulsions, certain oxyalkylated polyepoxide-treated amine-modified thermoplastic phenol-aldehyde resins and method of making same. 2,771,453, 11-20-56, Cl. 252—344.

De Groote, Melvin, and K.-T. Shen, to Petrolite Corp. Process for breaking petroleum emulsions, certain oxyalkylated polyepoxide-treated amine-modified thermoplastic phenol-aldehyde resins and method of making same. 2,771,454, 11-20-56, Cl. 252—344.

De Groote, Melvin, and K.-T. Shen, to Petrolite Corp. Process for breaking petroleum emulsions, certain oxyalkylated polyepoxide-treated amine-modified thermoplastic phenol-aldehyde resins and method of making same. 2,771,455, 11-20-56, Cl. 252—344.

De Groote, Melvin, and B. Keiser, to Petrolite Corp. Process for breaking emulsions. 2,771,450, 11-20-56, Cl. 252—341.

De Haan, Abel, Jr.: *See*—
Kamen, Martin D., and De Haan. 2,771,240.

De Leng, Vincent R., to Collins Radio Co. Impedance transformer network. 2,771,585, 11-20-56, Cl. 333—32.

Demalander, Roger, to The Compagnie de Pont-A-Mousson. Filler metal piece for the welding of spheroidal graphite cast iron. 2,770,871, 11-20-56, Cl. 29—196.1.

De Montagut, Jacques A. Medical apparatus for injection, insufflation, and the like. 2,771,072, 11-20-56, Cl. 128—241.

Dermond, Lawrence C.: *See*—
Olson, Elmer, and Dermond. 2,771,282.

Despard, Victor R., to Pass & Seymour, Inc. Convenience outlet for installation in finished walls. 2,771,501, 11-20-56, Cl. 174—53.

Detrex Corp.: *See*—
Kearney, Thomas J. 2,771,023.
Kearney, Thomas J. 2,771,086.

Deutsch, Sid, to Polytechnic Research & Development Co., Inc. Receiver tunable over V. H. F. and U. H. F. television bands. 2,771,543. 11-20-56. Cl. 250—20.

Deutsche Gold- und Silber-Scheideanstalt vormals Roessler: *See*—
Weibe, Adolf, and Hoffmann. 2,771,485.

Dewey, Roberta L. Integrated holder and dispenser. 2,771,219. 11-20-56. Cl. 222—93.

Diamond Match Co., The: *See*—
Cox, John W. 2,771,283.

Dick, A. B., Co.: *See*—

Fitzgerald, John V., and G. S. Bachman, to Pittsburgh Plate Glass Co. Radiation colorable chromium glass. 2,770,922, 11-20-56, Cl. 40—36.

Fitzpatrick, Henry. Hat hanger and identifying means for hat. 2,771,230, 11-20-56, Cl. 224—5.

Flagiello, Vincent A. Air operated clock. 2,770,941, 11-20-56, Cl. 58—42.

Fleischer, Arthur, to Nickel Cadmium Battery Corp. Electric battery plate and method of producing the same. 2,771,499, 11-20-56, Cl. 136—24.

Fleming, John S.: *See*—
Fleming, Margaret E. 2,771,084.
Fleming, Margaret E. 2,771,085.

Fleming, Margaret E., to J. S. Fleming. Dental cleaner. 2,771,084, 11-20-56, Cl. 132—89.

Fleming, Margaret E., to J. S. Fleming. Dental cleaner. 2,771,085, 11-20-56, Cl. 132—89.

Flex-O-Lators, Inc.: *See*—
Platt, John G. 2,771,129.

Flight Refuelling Ltd.: *See*—
MacGregor, Peter S., and Smith. 2,771,090.

Flora, Laurence H., to Tinnerman Products, Inc. Sheet metal lock nut with spring locking arm. 2,771,113, 11-20-56. Cl. 151—11.

Florence, Robert T.: *See*—
Chambers, Thomas S., and Florence. 2,771,372.
Chambers, Thomas S., and Florence. 2,771,373.
Chambers, Thomas S., and Florence. 2,771,374.

Flubacker, Charles H., to Cook Electric Co. Adjustable circuit control apparatus. 2,771,570, 11-20-56, Cl. 317—139.

Flynn, John B., to General Motors Corp. Ash tray. 2,771,209, 11-20-56. Cl. 220—18.

Folmsbee, Clyde H., to Union Tank Car Co. Tank anchor means for tank cars. 2,771,040, 11-20-56, Cl. 105—362.

Food Machinery and Chemical Corp.: *See*—
Dye, Harry W. 2,771,389.

Food Technology, Inc.: *See*—
Williams, Henry L. 2,771,247.

Foraker, Robert W., to National Lead Co. Glass-like composition and method for making the same. 2,771,375, 11-20-56, Cl. 106—49.

Fram Corp.: *See*—
Hockett, Carl G., Kennedy, and Vander Pyl. 2,771,119.

Franke, Norman W.: *See*—
Brown, George P., Jr., Crowley, and Franke. 2,771,482.

Frantz, Frederick H., and W. O. Schink, to General Aniline & Film Corp. Variable speed drive mechanism. 2,770,976, 11-20-56, Cl. 74—194.

Frazier Tandem Systems: *See*—
Frasier, Van L. 2,771,303.

Frasier, Van L., to Frasier Tandem Systems. Tandem axle spring suspension unit. 2,771,303, 11-20-56, Cl. 280—104.5.

Free Sewing Machine Co.: *See*—
Haile, Clement. 2,771,187.

Freedman, Louis H. Speed warning. 2,771,597, 11-20-56, Cl. 340—266.

Freeport Sulphur Co.: *See*—
Monroe, John E., Jr. 2,771,284.

Friederich, Herbert: *See*—
Reppe, Walter, Friederich, and Wiebusch. 2,771,478.

Fries, Peter, Jr.: *See*—
Danchig, Ira. 2,771,198.

Fry, William L.: *See*—
Cutter, Richard W., Strzala, and Fry. 2,771,177.

Fuchs, Reinhard, and E. J. Hechreiter, to The Budd Co. Panel structure particularly letterboard for railway cars. 2,771,041, 11-20-56, Cl. 105—401.

Fuller, Calvin S., to Bell Telephone Laboratories, Inc. Method of fabricating semiconductors for signal translating devices. 2,771,382, 11-20-56, Cl. 148—1.5.

Fuller, Dennis Q., to Pye Ltd. Quartz crystal units. 2,771,561, 11-20-56, Cl. 310—9.0.

Gagarine, Dmitry M., and H. Repokis, to Dan River Mills, Inc. Acrolein-formaldehyde condensation products and process of applying the same to cellulose fabric. 2,771,337, 11-20-56, Cl. 8—116.4.

Gair, Albert W.: *See*—
Booth, James H., and Gair. 2,771,301.
Booth, James H., and Gair. 2,771,302.

Galley, Gordon W., to Unilever Ltd. Servo mechanisms. 2,770,975, 11-20-56, Cl. 74—96.

Gammeter, John R. Apparatus for testing and sorting thin rubber articles. 2,771,190, 11-20-56, Cl. 209—74.

Gavey, Warren A. Variable door frame. 2,770,849, 11-20-56, Cl. 20—11.

Gehrig, Walter. Combined fishing weights and assembly bodies. 2,770,910, 11-20-56, Cl. 43—44.9.

Gem Oil Tool Co., Inc.: *See*—
Lewis, Farral F. 2,771,141.

General Aniline & Film Corp.: *See*—
Frantz, Frederick H., and Schink. 2,770,976.

General Dynamics Corp.: *See*—
Osberg Chester F., and Cooper. 2,771,533.

General Electric Co.: *See*—
Bramhall, George H., and Kemnitz. 2,771,152.
Creiman, Lyle P. 2,771,500.
Creesman, Robert C., and Reihman. 2,771,521.
Hansler, George M. 2,771,527.
Henderson, Wayne L. R. 2,771,587.
Hollister, Edwin S. 2,771,022.
Johnson, Frithiof V. 2,771,258.
Judd, Edwin B. 2,770,962.
Kimball, Donald G. 2,771,535.
Montmeat, Richard. 2,771,559.
Moran, Don E. 2,771,528.

General Mills, Inc.: *See*—
Hakomaki, Raymond I., and Huch. 2,770,933.
Holmberg, Stanton W. 2,770,896.
Ryan, James J. 2,771,256.

General Motors Corp.: *See*—
Anderson, Arthur J. 2,770,858.
Burrell, Gilbert. 2,771,064.
Cross, Charles T. 2,771,409.
Doane, Harry C. 2,770,971.
Earl, Harley J. 2,771,542.
Flynn, John B. 2,771,209.
Henry, Donald J. 2,770,859.
Miller, Charles W. and Todd. 2,771,569.
Olson, Elmer, and Dermaud. 2,771,262.
Webbere, Fisher F. 2,770,869.
General Refractories Co.: *See*—
Heuer, Russell P. 2,771,285.
General Tire & Rubber Co., The: *See*—
Seymour, Malcolm. 2,770,879.
Georgia-Pacific Plywood Co.: *See*—
Buckley, James L. 2,771,021.
Gerber, Harry, to Simplex Industrial Productions, Inc. Alarm system. 2,771,598, 11–20–56, Cl. 340—276.
Gettelman, Robert O., to Wisconsin Marine Co. Snow remover of the rotary type. 2,770,894, 11–20–56, Cl. 37—43.
Giacobbe, Paul: *See*—
Lodi, Emilio. 2,770,881.
Gibbs, Joe W.: *See*—
Sloan, Oliver C., and Gibbs. 2,771,142.
Gibson, Austin A.: *See*—
Barnes, Arthur W., Dyer, and Gibson. 2,771,457.
Gilliard, Joseph W. Car park. 2,771,200, 11–20–56. Cl. 214—16.1.
Godwin, Harry: *See*—
Streckfus, John G., and Godwin. 2,770,868.
Goins, John. Well cable signal device. 2,771,054, 11–20–56, Cl. 116—67.
Goldstein, Samuel E. Vehicular short-wave antenna. 2,771,604, 11–20–56, Cl. 343—749.
Gonsales, Don J., to American Air Filter Co., Inc. Filter frame handle construction. 2,771,154, 11–20–56, Cl. 183—49.
Goodgame, Thomas H.: *See*—
Michel, Laurent P. and Goodgame. 2,771,344.
Goodhue, Lyle D., to Phillips Petroleum Co. Soil conditioning. 2,770,921, 11–20–56, Cl. 47—58.
Goodman Mfg. Co.: *See*—
Miller, Frederick B. 2,771,272.
Goodwin, Roland D. Combination awning and shutter for window opening. 2,770,852, 11–20–56, Cl. 20—57.5.
Gould-National Batteries, Inc.: *See*—
Thompson, Niles J. 2,771,101.
Gourdou, Charles, to Avertisseurs Routiers Silencieux. Passsignal device for road vehicles. 2,771,594, 11–20–56, Cl. 340—34.
Graham and Barker: *See*—
Stevenson, Evan H., Ramore, and Hughes. 2,770,961.
Graham, Phillip. Curved closure device. 2,770,850, 11–20–56, Cl. 20—35.
Gratzl, Kurt. Impulse generator for medical use. 2,771,554, 11–20–56, Cl. 250—27.
Gratzmuller, Jean L. Crankpin-piston connecting means. 2,770,972, 11–20–56. Cl. 74—49.
Greenberger, William: *See*—
Lutz, Harry H., and Greenberger. 2,770,898.
Greminger, George K., Jr., and M. A. Weaver, to The Dow Chemical Co. Thermoplastic compositions of water-soluble cellulose ethers. 2,771,377, 11–20–56, Cl. 106—186.
Gretener, Edgar. Optical illumination system with homogeneous distribution of light for projectors. 2,771,001, 11–20–56, Cl. 88—24.
Grey, John C., to Power Jets (Research & Development) Ltd. Mass flow monitor. 2,770,968, 11–20–56, Cl. 73—205.
Griggs, Bennett T.: *See*—
Wahlbom, Ernest T. 2,771,334.
Griswold, Owen H. Safety caps for aircraft fuel tanks. 2,771,210, 11–20–56, Cl. 220—40.
Groff, Dana M., and C. S. Stanley; said Stanley assor. to said Groff. Louvered window frame. 2,770,853, 11–20–56. Cl. 20—62.
Guhring, Gottlieb: *See*—
Nidelin, Eugen. 2,770,929.
Gulf Research & Development Co.: *See*—
Brown, George P., Jr., Crowley, and Franke. 2,771,482.
Gulnick, Adrien N.: *See*—
McCarthy, George F., and Gulnick. 2,771,562.
Guris, Peter J. Automatic dynamic balancer. 2,771,240, 11–20–56, Cl. 230—134.
Gustafson, Eric W. Boat mooring means. 2,771,053, 11–20–56, Cl. 114—230.
Gustavsson, Karl A. G., to Aktiebolaget B. A. Hjorth & Co. Method of converting kinetic energy to pressure energy and a device for carrying out the method. 2,771,157, 11–20–56, Cl. 183—83.
Guttridge, Eric J., to Powers-Samas Accounting Machines Ltd. Record card controlled statistical machines. 2,771,293, 11–20–56, Cl. 271—88.
Hackley, Reginald A.: *See*—
Rogers, Edward S., and Hackley. 2,771,557.
Hackney, Floyd. End terminals for tape lines. 2,770,883, 11–20–56, Cl. 33—137.
Hadley, Harlan A., to Metrogram Corp. of America. Weighing scales. 2,771,289, 11–20–56, Cl. 265—54.
Hahn, Oliver M., and R. S. Mallouk, to E. I. du Pont de Nemours and Co. Injection molding of polytetrafluoroethylene. 2,770,842, 11–20–56, Cl. 18—55.
Haile, Clement, to Free Sewing Machine Co. Needle packet. 2,771,187, 11–20–56, Cl. 206—66.
Hakomaki, Raymond I., and W. F. Huch, to General Mills, Inc. Method of forming balloons containing messages. 2,770,933, 11–20–56, Cl. 53—29.
Hall, William J. Film developing device. 2,771,015, 11–20–56, Cl. 95—90.5.
Hallberg, Einar B.: *See*—
Carson, George J., and Hallberg. 2,771,571.
Halliday, William, and H. M. Jefferys, to Kelvin and Hughes Ltd. Apparatus for non-destructive testing of solid bodies by acoustic oscillations. 2,770,966, 11–20–56, Cl. 73—67.9.
Halold Co., The: *See*—
Mayo, Clyde R., Crumrine, and Rosenthal. 2,771,002.
Halverson, Kenneth M.: *See*—
Halverson, Merlin L. 2,771,052.
Halverson, Merlin L., to K. M. Halverson. Boat bailer. 2,771,052, 11–20–56, Cl. 114—185.
Hamilton Shoe Co.: *See*—
Morphy, John W. 2,770,824.
Hammond, Cecil F., and W. Shackleton, deceased (C. F. Hammond, administrator), ½ to Lining Components Ltd. Liquid container. 2,771,221, 11–20–56, Cl. 222—111.
Hampton, Robert W.: *See*—
Avery, Harold T., and Hampton. 2,771,505.
Hampton, Robert W., to Marchant Calculators, Inc. Counting circuits. 2,771,550, 11–20–56, Cl. 250—27.
Hampton, Robert W., to Marchant Calculators, Inc. Counting circuits. 2,771,551, 11–20–56, Cl. 250—27.
Hampton, Robert W., to Marchant Calculators, Inc. Diode capacitor regenerator. 2,771,575, 11–20–56, Cl. 320—1.
Hancock Brick and Tile Co., The: *See*—
Schmunk, John D. 2,770,861.
Handley, John, ½ to J. N. Browne. Pit prop. 2,771,264, 11–20–56, Cl. 248—356.
Hankey, Ernest H., to Monsanto Chemical Co. Pressure head for extruders. 2,770,836, 11–20–56, Cl. 18—12.
Hansen, Alfred J., now by change of name J. A. Hansen, to Allis-Chalmers Mfg. Co. Thread arrangement for engaged male and female members having different coefficients of thermal expansion. 2,770,997, 11–20–56, Cl. 85—1.
Hansen, John A.: *See*—
Hansen, Alfred J. 2,770,997.
Hanson, Hasel M.: *See*—
Openorth, John E., and Hanson. 2,771,215.
Hare, Terence G., to Miller Mfg. Co. Car top luggage carrier structure. 2,771,231, 11–20–56, Cl. 224—42.1.
Harley-Davidson Motor Co.: *See*—
Harley, William J. 2,770,869.
Harley, William J., to Harley-Davidson Motor Co. Method of making roller bearing cage. 2,770,869, 11–20–56, Cl. 29—148.4.
Harney, William C.: *See*—
Van Gilder, Carll F., and Harney. 2,771,458.
Harris, Cyril M.: *See*—
Dudley, Homer W., and Harris. 2,771,509.
Harrison, Charles W.: *See*—
Anderson, William A., and Harrison. 2,771,556.
Harrison, Charles W., and G. Nielsen, Jr., to Bell Telephone Laboratories, Inc. Power amplifier for television. 2,771,517, 11–20–56, Cl. 179—171.
Haskell, Alden H. Window. 2,771,133, 11–20–56, Cl. 160—89.
Haskin, Walter E., to Pressed and Welded Steel Products Co., Inc. Book rack. 2,770,913, 11–20–56, Cl. 45—58.
Haskin, Walter E., to Pressed and Welded Steel Products Co., Inc. Binder. 2,771,075, 11–20–56, Cl. 129—1.
Hastings, Randall, E. K. Drechsel, and E. Strasdins, to American Cyanamid Co. Novel sizing agents for paper. 2,771,464, 11–20–56, Cl. 260—101.
Hatala, John, Knob. 2,770,983, 11–20–56, Cl. 74—553.
Haughton Elevator Co.: *See*—
Borden, Joseph H., and Vlasak. 2,771,160.
Hausler, George M., to General Electric Co. Snap action switch. 2,771,527, 11–20–56, Cl. 200—67.
Hayes, Monson H.: *See*—
West, James L., and Hayes. 2,771,578.
Hayner, Paul F., to Sanders Associates, Inc. Two-stage differential servo valve. 2,771,062, 11–20–56, Cl. 121—41.
Haseltine Research, Inc.: *See*—
Bloch, Alfred. 2,771,583.
Headland, Herbert N.: *See*—
Russell, John J., and Headland. 2,771,410.
Hemeyer, Arley C.: *See*—
Vitcha, James F., and Hemeyer. 2,771,308.
Henderson, Edward. Closure assembly. 2,771,218, 11–20–56, Cl. 222—83.
Henderson, Wayne L. R., to General Electric Co. Inductive device. 2,771,587, 11–20–56, Cl. 336—160.
Hendrickson, Arnold P., W. R. Keye, and J. H. Howard, to Sperry Rand Corp. Data storage system. 2,771,595, 11–20–56, Cl. 340—174.
Hendrickson, Fritz E., to Norton Co. Coated abrasive wheel element. 2,770,927, 11–20–56, Cl. 51—193.
Henkel & Cie. G. m. b. H.: *See*—
Blaser, Bruno, and Tischbirek. 2,771,484.
Hennig, Ralph R., to Allied Chemical & Dye Corp. Filter apparatus. 2,771,153, 11–20–56, Cl. 183—46.
Henry, Donald J., to General Motors Corp. Method of treating a metallic pattern for shell molding. 2,770,859, 11–20–56, Cl. 22—193.
Hensel, Bernhard, to Loewe Opta Aktiengesellschaft. Radiation generation system for electronic radiation valves with ionic trap. 2,771,564, 11–20–56, Cl. 313—82.
Hercules Powder Co.: *See*—
Conner, Joshua C., Jr. 2,771,491.
Hervert, George L., to Universal Oil Products Co. Process for the production of secondary alkylaryl hydrocarbons. 2,771,496, 11–20–56, Cl. 260—671.
Hess, Frederic O., to Selas Corp. of America. Apparatus for coating pipes. 2,771,056, 11–20–56, Cl. 118—64.
Hessert, Charles, Jr. Combined fishing sinker and line spreader. 2,770,908, 11–20–56, Cl. 43—42.74.
Heuer, Russell P., to General Refractories Co. Regenerator. 2,771,285, 11–20–56, Cl. 263—15.

Hicks, George L., ½ to R. E. Weinsettel. Wheeled toy with tin can body. 2,770,915, 11–20–56, Cl. 46—22.
Hildebrandt, Alexander B., to Esso Research and Engineering Co. Recycle fluid control in pellet impact drilling. 2,771,274, 11–20–56, Cl. 255—61.
Himel, Curtis J. Ant and insect traps. 2,770,911, 11–20–56, Cl. 43—121.
Hinchman, Digby R. Combination stool and game carrying dolly for hunters. 2,771,299, 11–20–56, Cl. 280—30.
Hindu Incense Mfg. Co.: *See*—
Misseika, Victor J. 2,770,854.
Hochreiter, Edward J.: *See*—
Fuchs, Reinhard, and Hochreiter. 2,771,041.
Hockett, Carl G., W. V. Kennedy, and C. A. Vander Pyl, Jr., to Fram Corp. Apparatus for pleating paper. 2,771,119, 11–20–56, Cl. 154—30.
Hoffmann, Ullrich: *See*—
Weihe, Adolf, and Hoffmann. 2,771,485.
Hoganis-Billesholms Aktiebolag: *See*—
Barth, Otto F. F. 2,771,341.
Hogg, John A., P. F. Beal, A. H. Nathan, and F. H. Lincoln, to The Upjohn Co. Steroids. 2,771,475, 11–20–56, Cl. 260—397.1.
Holliday, Theodore B.: *See*—
Webb, Chester H., and Holliday. 2,771,291.
Hollister, Edwin S., to General Electric Co. Operating mechanism for automatic electric toasters. 2,771,022, 11–20–56, Cl. 99—329.
Holmberg, Stanton W., to General Mills, Inc. Spray flatiron. 2,770,896, 11–20–56, Cl. 38—78.
Holmburger, Max, to Link-Belt Co. Belt conveyor take-up. 2,771,178, 11–20–56, Cl. 198—139.
Holmes, Raymond S., B. C. Baldridge, J. J. O'Neill, Jr., and C. E. Silk, to Olin Mathieson Chemical Corp. Propellant. 2,771,351, 11–20–56, Cl. 52—13.
Holmlund, Evar A. Expandable sanding drum. 2,770,926. 11–20–56, Cl. 51—190.
Holzworth, Lauriene T.: *See*—

Hampton, Robert W. 2,771,575.
Nolde, George V., and Avery. 2,771,599.
Marchant Research, Inc.: *See*—
Avery, Harold T., and Hampton. 2,771,505.
Mark, Victor, to Universal Oil Products Co. Polyhalo-2,3-epoxy-bicyclo (2.2.1) heptanes. 2,771,470, 11–20–56, Cl. 260—327.
Marsden, Keneth R.: *See*—
Wilstefeld, Heinrich. 2,770,970.
Marsh, John C., to Eastern Rotocraft Corp. Adjustable wheel chock. 2,771,162, 11–20–56, Cl. 188—32.
Martin, Claude, to Houdaille Industries, Inc. Swivel wheel damper. 2,770,832, 11–20–56, Cl. 16—35.
Marzuller, Paul A. Combination wardrobe, upending bed, and dressing table. 2,770,813. 11–20–56, Cl. 5—2.
Mascuch, Joseph J.: *See*—
Nardone, Romeo M. 2,771,067.
Mast Development Co., Inc.: *See*—
Mast, Gifford M. 2,771,013.
Mast, Gifford M., to Mast Development Co., Inc. Stereoscopic camera. 2,771,013, 11–20–56, Cl. 95—18.
Mastney, Edward J., and J. H. Williams, to Oak Mfg. Co. Index mechanism. 2,770,982, 11–20–56, Cl. 74—527.
Mauborgne, Paul. Line-winding mechanism for fishing reels with fixed drums. 2,771,253, 11–20–56, Cl. 242—84.1.
Maxwell, Glenn W.: *See*—
Maxwell, Walter. 2,771,024.
Maxwell, Walter, ½ to G. W. Maxwell. Tensioning adjusting device for the baling chambers of baling presses. 2,771,024, 11–20–56, Cl. 100—43.
Mayo, Clyde R., H. E. Crumrine and J. F. Rosenthal, to The Haloid Co. Apparatus for use with xerographic X-ray powder images. 2,771,002, 11–20–56, Cl. 88—24.
Mattikow, Morris: *See*—
Chasanov, Martin G., Kunin, Mattikow, and Thurman. 2,771,480.
McAdams, Bruce.: *See*—
Metzger, Sidney, Hughes, and McAdams. 2,771,553.
McCarthy, George F., and A. N. Gulnick, to International Telephone and Telegraph Corp. Telephone ringing generator. 2,771,562, 11–20–56, Cl. 310—69.
McCormick, Francis A., to Owens-Illinois Glass Co. Lifting fork for stacked articles. 2,771,204, 11–20–56, Cl. 214—655.
McGinley, William L., to American Permanent Wear Co. Detachable serving tray for automobiles. 2,771,332, 11–20–56, Cl. 311—21.
McIntyre, Alexander A.: *See*—
Baxter, Thomas D., and McIntyre. 2,771,194.
McKillop, William M.: *See*—
Ryno, Earle R., and McKillop. 2,771,184.
McLellan, Kenneth M., to Industrial Rayon Corp. Thread-advancing reel. 2,770,962, 11–20–56, Cl. 68—205.
McMillan, James A.: *See*—
Dittmore, Ray H., Richter, Shadd, McMillan, and Trickle. 2,771,540.
McNary, Billy D.: *See*—
Bryant, John H., and McNary. 2,771,565.
Mead, William H., A. A. Zambruno, and A. L. Jett, to W. H. Mead. Instant stop and start blasting device. 2,770,924, 11–20–56, Cl. 51—8.
Meguerian, Garbis H.: *See*—
Kalinowski, Mathew L., and Meguerian. 2,771,403.
Meguerian, Garbis H., to Standard Oil Co. Stabilised cracked petroleum fractions. 2,771,348, 11–20–56, Cl. 44—72.
Mehaffey, Robert J., to Colgate-Palmolive Co. Hair grooming preparation. 2,771,394, 11–20–56, Cl. 167—87.
Mehaffey, Robert J., to Colgate-Palmolive Co. Aqueous alcoholic hair grooming preparation employing sodium carboxymethyl cellulose. 2,771,395, 11–20–56, Cl. 167—87.
Melamed, Sidney: *See*—
Moser, Vincent J., and Melamed. 2,771,362.
Merck & Co., Inc.: *See*—
Schultz, Everett M. 2,771,469.
Mercury Engineering Corp.: *See*—
Zernov, Peter. 2,771,011.
Mers, Edmund H., and G. E. Urban, to Monsanto Chemical Co. Method of forming an electrical winding. 2,771,386, 11–20–56, Cl. 154—80.
Messman, Arthur. Folding typewriter desk for automobiles. 2,771,331, 11–20–56, Cl. 311—21.
Messmer, Robert C., to American Viscose Corp. Dispensing container for needles, punches, and the like. 2,771,192, 11–20–56, Cl. 206—17.
Meszaros, George W., to Bell Telephone Laboratories, Inc. Current supply apparatus. 2,771,576, 11–20–56, Cl. 321—18.
Metoff, Boris G., to Rotex Co. Power driven hand tools. 2,771,105, 11–20–56, Cl. 144—117.
Metrogram Corp. of America: *See*—
Hadley, Harlan A. 2,771,289.
Metzger, Sidney, R. W. Hughes, and B. McAdams, to International Telephone and Telegraph Corp. Multiplex demodulator. 2,771,553, 11–20–56, Cl. 250—27.
Meyer, Geo. J., Mfg. Co.: *See*—
Meyer, George L. N. 2,771,202.
Meyer, George L. N., to Geo. J. Meyer Mfg. Co. Case unloaders. 2,771,202, 11–20–56, Cl. 214—309.
Michaelis, Karl. Wood-bending machine. 2,771,109, 11–20–56, Cl. 144—254.
Michel, Laurent P., and T. H. Goodgame, to Godfrey L. Cabot, Inc. Manufacture of iron oxide pigment. 2,771,344, 11–20–56, Cl. 23—200.
Mid-States Gummed Paper Co.: *See*—
Humphner, Ferdinand W. 2,771,385.

Miessner, Benjamin F. Non-flooding fountain pen. 2,771,059, 11–20–56, Cl. 120—48.

Miller, Charles W., and H. E. Todd, to General Motors Corp. Automatic headlight dimmer system high voltage switching. 2,771,569, 11–20–56, Cl. 315—83.

Miller, Donald M. Automatic control for screw operated press. 2,770,862, 11–20–56, Cl. 25—42.

Miller, Elmer C., and D. E. Berger, to Phillips Petroleum Co. Controlling heat value of a fuel gas in a gas separation system. 2,771,149, 11–20–56, Cl. 183—2.

Miller, Frederick B. to Goodman Mfg. Co. Drilling system. 2,771,272, 11–20–56, Cl. 255—50.

Miller Mfg. Co.: *See*—
Hare, Terence G. 2,771,231.

Miller, Robert T.: *See*—
Angelica, Wilbert W., and Miller. 2,770,831.

Miller, Wallace W.: *See*—
Hook, Charles H., and Miller. 2,771,131.

Mills, Jim W., to G. H. Julien. Adaptor for handling a nursing nipple. 2,771,073, 11–20–56, Cl. 128—252.

Millward, Edward A., to J. A. Phillips and Co. Ltd. Variable speed gear control lever mechanism for bicycles and like vehicles. 2,770,980, 11–20–56, Cl. 74—489.

Mininberg, Ella: *See*—
Mininberg, Nathan D. 2,771,365.

Mininberg, Nathan D., to E. Mininberg. Method of making bread from grain kernels. 2,771,365, 11–20–56, Cl. 99—90.

Misseika, Victor J., to Hindu Incense Mfg. Co. Incense briquette. 2,770,854, 11–20–56, Cl. 21—116.

Mitchell, John H. Automatic releasing hook. 2,771,316, 11–20–56, Cl. 294—83.

Mitchell, Len B.: *See*—
Schinske, William G., and Mitchell. 2,771,588.

Modern Products Mfg. Corp.: *See*—
Von Duyke, Harrison M. 2,770,888.

Moeller, Carl A.: *See*—
Claff, Clarence L., and Moeller. 2,771,236.

Moeller, William C., to Parmelee Plastics Co. Partial frame type spectacles having removable shield section. 2,770,806, 11–20–56, Cl. 2—12.

Moise, James E.: *See*—
Jacks, Robert L., Moise, and Nicholson. 2,771,493.

Moklebust, Olav, and A. G. Oppegaard, to National Lead Co. Concentration of iron ores. 2,771,354, 11–20–56, Cl. 73—33.

Moline Tool Co., The: *See*—
Bergstrand, Richard H. 2,771,172.

Moneagle, Otto F.: *See*—
Kistner, Harold J., and Moneagle. 2,771,025.

Monroe, John E., Jr., to Freeport Sulphur Co. Process for removal of deposits from sulfur mining pipes using hot caustic soda solution. 2,771,284, 11–20–56, Cl. 262—3.

Monsanto Chemical Co.: *See*—
Hanker, Ernest H. 2,770,836.
Mers, Edmund H., and Urban. 2,771,386.

Montgomery, Donald H., and C. D. Pulsifer, to The New Britain Machine Co. Stock tube. 2,771,181, 11–20–56, Cl. 203—92.

Montmeat, Richard, to General Electric Co. Portable clock radio. 2,771,559, 11–20–56, Cl. 307—156.

Moon, Clifford G., to Draper Corp. Loom drive means. 2,771,097, 11–20–56, Cl. 139—1.

Mooney, Laurence R. Stencil assembly. 2,771,026, 11–20–56, Cl. 101—128.2.

Mooradian, Victor G., to The H. A. Wilson Co. Thermosensitive laminated metals. 2,770,870, 11–20–56, Cl. 29—195.5.

Moore, Robert C., and R. G. Clapp, to Philco Corp. Color television indexing system. 2,771,504, 11–20–56, Cl. 178—5.4.

Morain, Paul H. L.: *See*—
Lasserre, Gaston M., Laville, and Morain. 2,771,144.

Moran, Don E., to General Electric Co. Thermal overload switch. 2,771,528, 11–20–56, Cl. 200—122.

Morana, Simon J., to The Beryllium Corp. Rare earth master alloys. 2,771,339, 11–20–56, Cl. 75—170.

Morehouse, Clarence K. to Olin Mathieson Chemical Corp. Dry cell. 2,771,381, 11–20–56, Cl. 136—138.

Moreillon, Raymond, to Ateliers de Construction Oerlikon. Arrangement for the transposition of a hollow cylindrical slide. 2,771,239, 11–20–56, Cl. 230—114.

Morf, Ernest. Motor-spring winding mechanism. 2,771,159, 11–20–56, Cl. 185—39.

Morphy, John W., to Hamilton Shoe Co. Method of making platform shoes. 2,770,824, 11–20–56, Cl. 12—142.

Morris, Richard S., Jr., to American Telephone and Telegraph Co. Line clearing device for receiver-off-hook condition. 2,771,511, 11–20–56, Cl. 179—30.

Morris, Rupert C., and V. W. Buls, to Shell Development Co. Tertiary alkyl substituted cyclohexane carboxylic acids, derivatives thereof, and method for producing the same. 2,771,487, 11–20–56, Cl. 260—514.

Morrison, Albert R. and H. E. Fargo, to Owens-Corning Fiberglas Corp. Glass fiber twine and method of manufacturing the same. 2,770,940, 11–20–56, Cl. 57—150.

Morrison, Willard L., to Union Stock Yards & Transit Co. of Chicago. Apparatus for unloading in gaseous form from a liquefied gas storage body. 2,770,951, 11–20–56, Cl. 62—1.

Morton, Richard N. Animated advertising signs. 2,770,901, 11–20–56, Cl. 40—77.

Moser, Vincent J., and S. Melamed, to Rohm & Haas Co. Cellulose fibrous products containing polymers of vinyloxyethylurea and method of producing them. 2,771,362, 11–20–56, Cl. 92—3.

Motorola, Inc.: *See*—
Fish, James L. 2,771,049.

Wahlbom, Ernest T., to B. T. Griggs. Portable bar. 2,771,334, 11–10–56, Cl. 312—140.4.

Wahlstrom, Magnus, to The Bridgeport Machines, Inc. Rotary work table. 2,771,169, 11–20–56, Cl. 192—4.

Wainwright, William N., W. M. Venner, and P. L. Bowser, Jr., to Sterling Aluminum Products, Inc. Piston ring groove protector. 2,771,328, 11–20–56, Cl. 309—14.

Walker, Brooks. Venetian blind. 2,771,135, 11–20–56, Cl. 160—168.

Wallace, Donald J., and L. Catallo, to Wheel Trueing Tool Co. Form dressing tool. 2,770,925, 11–20–56, Cl. 51—184.1.

Walworth, Clarence B.: *See*—
Winterburn, George A., Walworth, and Lawrence. 2,771,287.

Weaver, Miles A.: *See*—
Greminger, George K., Jr., and Weaver. 2,771,377.

Webb, Chester H., and T. B. Holliday. Elastic cord shock absorber. 2,771,291, 11–20–56, Cl. 267—63.

Webbere, Fred J., to General Motors Corp. Casting readily oxidizable alloys. 2,770,860, 11–20–56, Cl. 22—214.

Webster Electric Co.: *See*—
Jensen, Clarence F. 2,771,513.
Munroe, David J. 2,771,512.

Weedman, John A., to Phillips Petroleum Co. Selective solvent extraction of naphthene hydrocarbons employing 2-pyrrolidone. 2,771,494, 11–20–56, Cl. 260—666.

Weese, Harry. Method for producing a surface of desired contour on a moldable substance. 2,770,864, 11–20–56, Cl. 25—155.

Weihe, Adolf, and U. Hoffmann, to Deutsche Gold- und Silber-Scheideanstalt vormals Roessler. Production of carbamate compounds. 2,771,485, 11–20–56, Cl. 260—482.

Weimer, Paul K., to Radio Corp. of America. Color television. 2,771,567, 11–20–56, Cl. 315—21.

Weinstock, Harry H., Jr., to Allied Chemical & Dye Corp. Process for copolymerising acrylonitrile and acrylate esters. 2,771,461, 11–20–56, Cl. 260—85.5.

Weintraub, Robert L.: *See*—
Brown, James W., and Weintraub. 2,771,217.

Weinzettel, Roy E.: *See*—
Hicks, George L. 2,770,915.

Weiss, Willi, to Brevets Aero-Mecaniques, S. A. Grenade launching device for a firearm having a muzzle brake. 2,770,904. 11–20–56. Cl. 42—1.

Welts, Jeremy, to APRA Precipitator Corp. Protective relay circuits. 2,771,150, 11–20–56, Cl. 183—7.

Wendel, Lorenz A., to The Singer Mfg. Co. Cooled bearings for oven drying machines. 2,770,891, 11–20–56, Cl. 34—218.

Werfeli, Arnold, to Paillard S. A. Highly corrected photographic objectives comprising four axially air spaced components. 2,771,006, 11–20–56, Cl. 88—57.

West, James L., and M. H. Hayes, to Link Aviation, Inc. Potential divider coupling circuits. 2,771,578, 11–20–56, Cl. 323—79.

West, Paul B.: *See*—
Anderson, Gordon C., and West. 2,770,845.

Western Electric Co., Inc.: *See*—
Myers, Hubert A. 2,771,539.

Western Engineering Associates: *See*—
Scurlock, James C. 2,771,164.

Wetter, Charles, to National Electronics, Inc. Motor-control apparatus. 2,771,574, 11–20–56, Cl. 318—227.

Weymouth, Leon J., Jr., to United Aircraft Corp. Lacing for compressor blades. 2,771,267, 11–20–56, Cl. 253—77.

Wheel Trueing Tool Co.: *See*—
Wallace, Donald J., and Catallo. 2,770,925.

White, Walter L.: *See*—
Yocke, Bernard A., Carter, and White. 2,770,882.

Whiteside, Richard H. Body supporting and bathing device. 2,770,812. 11–20–56. Cl. 4—145.

Whitney, William B., to Phillips Petroleum Co. Adsorption process for separating elementary sulfur from sulfurized diaryl alkanes. 2,771,465, 11–20–56, Cl. 260—139.

Wickstrom, Theodore: *See*—
Claras, Carl W., and Wickstrom. 2,771,526.

Wiebusch, Klaus: *See*—
Reppe, Walter, Friederich, and Wiebusch. 2,771,478.

Wiegel, Carol M.: *See*—
Wiegel, Louis A. and D. W. 2,770,820.

Wiegel, Dave W.: *See*—
Wiegel, Louis A. and D. W. 2,770,820.

Wiegel, Louis A. and D. W.: said L. A. Wiegel assor. to C. M. Wiegel. Portable pipe threading tool. 2,770,820, 11–20–56, Cl. 10—89.

Wieser, Clarence C.: *See*—
Odlum, William H., Hosford, and Wieser. 2,771,103.

Wildhaber, Ernest. Mechanical motion mechanism. 2,770,973, 11–20–56. Cl. 74—50.

Wilkening Mfg. Co.: *See*—
Braendel, Helmuth G. 2,771,329.

Williams, Arthur L., and D. F. Brace, to The Federal Machine and Welder Co. Apparatus for producing tubular members. 2,771,046, 11–20–56, Cl. 113—11.

Williams, Arthur L., to The Federal Machine and Welder Co. Welding apparatus. 2,771,538, 11–20–56, Cl. 219—78.

Williams, Claude B. Apparatus and method for the manufacture of spun synthetic threads and/or yarns. 2,770,835, 11–20–56, Cl. 18—8.

Williams, Henry L., to Food Technology, Inc. Constant humidity apparatus. 2,771,247. 11–20–56, Cl. 236—44.

Williams, Holly L. Scraper. 2,770,829, 11–20–56, Cl. 15—236.

Williams, John H.: *See*—
Mastney, Edward J., and Williams. 2,770,982.

Williams, Stewart F.: *See*—
Stoddard, Edgar A., Jr., and Williams. 2,771,490.

Williamson, Byron and T. A. Synergistic insecticidal compositions. 2,771,390. 11–20–56, Cl. 167—30.

Williamson, T. D., Inc.: *See*—
Ver Nooy, Burton. 2,771,096.

Williamson, Thurmond A.: *See*—
Williamson, Byron and T. A. 2,771,390.

Wilson, H. A., Co., The: *See*—
Mooradian, Victor G. 2,770 870.

Wilson, Harry O. Bleeder valve for hydraulic brake systems. 2,771,093, 11–20–56, Cl. 137—614.17.

Winningstad, Chester N., and Q. A. Kerns, to the United States of America as represented by the United States Atomic Energy Commission. Phase meter. 2,771,582, 11–20–56, Cl. 324—85.

Winterburn, George A., C. B. Walworth, and L. E. Lawrence; said Walworth and said Lawrence assors. to said Winterburn. Timing actuator with hydraulic link. 2,771,287, 11–20–56, Cl. 264—13.

Wisconsin Marine Co.: *See*—
Getteiman, Robert O. 2,770,894.

Woker, Alfred W.: *See*—
Becker, Adam W., and Woker. 2,770,856.

Wolin, Louis, and A. M. Carter, Jr. Apparatus for simulating an engine. 2,771,243. 11–20–56, Cl. 235—61.

Woods, John E., to Standard-Thomson Corp. Pilot operated valve. 2 771,265. 11–20–56, Cl. 251—28.

Woodworth, Warner, and A. Orr. Water craft. 2,770,817, 11–20–56. Cl. 9—3.

Wright, Leroy D., and S. L. Judkins, to Link Aviation, Inc. Universal station identification signal keyer for use in grounded aviation trainers. 2,771,600, 11–20–56, Cl. 340—365.

Wright, William R., to Bird & Son, Inc. Building corner construction. 2,770,847. 11–20–56, Cl. 20—5.

Wroughton, Donald, to the United States of America as represented by the United States Atomic Energy Commission. Method of melting metal powder in vacuo. 2,771,357, 11–20–56. Cl. 75—84.1.

Wurtzer, August C.: *See*—
Constance Harry S., Jr., and Wurtzer. 2,771,276.

Wüstefeld, Heinrich, to K. R. Marsden. Lubricating device for gas meters. 2 770,970, 11–20–56, Cl. 73—272.

Wynne, William A.: *See*—
Chapman, James, and Wynne. 2,771,492.

Yocke, Bernard A., W. J. Carter, and W. L. White. Artificial mouth apparatus. 2,770,882. 11–20–56. Cl. 32—71.

Young, Glenn S. Electric power supply system and method of controlling same. 2 771,558. 11–20–56. Cl. 307—85.

Young, Raymond A. Mounting and drive for helicopter rotor. 2,771,255 11–20–56. Cl. 244—17.27.

Zaalberg, Willem, to Smit-Rontgen N. V. Tilting mechanism for X-ray examination table. 2,771,330, 11–20–56, Cl. 311—6.

Zahn, Karl M., to International Harvester Co. Spring mounted tool shank. 2,771,018, 11–20–56, Cl. 97—47.84.

Zambruno, Arthur A.: *See*—
Mead, William H., Zambruno, and Jett. 2,770 924.

Zeegers, Johannes A., to Stamicarbon N. V. Process of converting substances ionized in solution with the help of ion exchangers. 2,771,418, 11–20–56, Cl. 210—24.

Zeiss, Carl: *See*—
Stelgerwald, Karl H. 2,771,568.

Zeltz, Frederick H., ½ to J. D. Smith, Jr. Weeding hoe. 2 771 019. 11–20–56, Cl. 97—68.

Zeller Corp., The: *See*—
Skiatimas, George. 2,771,063.

Zenith Radio Corp.: *See*—
Bell, John F., and Nordby. 2,771,547.

Zepelovitch, Nathan, to N. A. Bernstein. Closure member. 2,771 205, 11–20–56. Cl. 215—52.

Zernov, Peter, to Mercury Engineering Corp. Blank counting mechanism. 2,771,011. 11–20–56, Cl. 93—93.

Zimmerman, Jack J., to Motorola, Inc. Soldering machine. 2,770 875. 11–20–56. Cl. 29—503.

Zimmerman, Jack J., to Motorola, Inc. Automatic soldering mechanism. 2 771,047. 11–20–56. Cl. 113—59.

Zimmerman, Jack J. to Motorola, Inc. Automatic soldering machine. 2 771,048. 11–20–56 Cl. 113—59.

Zimmerman, Jack J. to Motorola, Inc. Automatic soldering machine. 2,771 050 11–20–56. Cl. 113—59.

Zion, Moses, to The Lionel Corp. End constructions for toy cars. 2,770,917, 11–20–56, Cl. 46—218.

# CLASSIFICATION OF PATENTS

## ISSUED NOVEMBER 20, 1956

NOTE.—First number—class, second number—subclass, third number—patent number

1— 44.5: 2,771,607
49: 2,770,804
101: 2,770,805
2— 12: 2,770,806
14: 2,770,807
37: 2,770,808
169: 2,770,809
236: 2,770,810
3— 22: 2,770,811
4— 145: 2,770,812
5— 2: 2,770,813
13: 2,770,814
37: 2,770,815
355: 2,770,816
8—116.4: 2,771,337
9— 3: 2,770,817
10— 27: 2,770,818
89: 2,770,819

The TRADEMARK SECTION of the OFFICIAL GAZETTE, issued weekly, is mailed under the direction of the Superintendent of Documents, Government Printing Office, Washington 25, D. C., to whom all subscriptions should be made payable and all communications addressed; subscription price, $10.00 per annum, foreign mailing $2.00 additional; single copies, 20 cents each.

# MARKS PUBLISHED FOR OPPOSITION

The following marks are published in compliance with section 12(a) of the Trademark Act of 1946. Notice of opposition under section 13 may be filed within thirty days of this publication. See Rules 20.1 to 20.5.

As provided by section 31 of said act, a fee of twenty-five dollars must accompany each notice of opposition.

## CLASS 1

### RAW OR PARTLY PREPARED MATERIALS

SN 684,298. Fiber Bond Corporation, Chicago, Ill. Filed Mar. 28, 1955.

FIBERBOND

For Nonwoven Batts Used for Padding and Made of Synthetic and/or Natural Fibers.
First use on or about Oct. 12, 1954.

SN 684,436. Koppers Company, Inc., Pittsburgh, Pa. Filed Mar. 29, 1955.

DYLEX

For Latex Composition—Namely, Styrene Butadiene Latex.
First use Feb. 28, 1955.

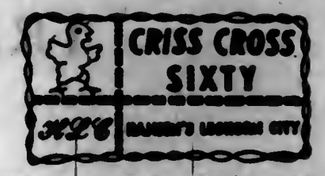
SN 692,998. Aquafil Company, Cedar Rapids, Iowa. Filed Aug. 15, 1955.

CHICK-BED

For Diatomaceous Earth for Use as Surface Covering in Poultry Yards.
First use Aug. 7, 1941.

SN 693,418. Carl Freudenberg Kommanditgesellschaft Auf Aktien, Weinheim an der Bergstrasse, Germany. Filed Aug. 18, 1955.

Marena



Owner of German Reg. No. 481,668, dated Jan. 3, 1936.
For Bristles, Hair, Artificial Bristles, and Artificial Hair Such as Artificial Horsehair, for Use in Upholstery Fillings, Brushes, Brooms, and the Like.

SN 695,913. The B. F. Goodrich Company, d. b. a. B. F. Goodrich Chemical Co., a division of The B. F. Goodrich Company, Akron, Ohio. Filed Oct. 5, 1955.

DARLAN

For Synthetic Fibers and Filaments in the Form of Staple Fibers, Continuous Filaments or Tow.
First use Sept. 12, 1955.

SN 696,439. Henry J. Hansen, Puyallup, Wash. Filed Oct. 14, 1955.

For Hatching Eggs, Baby Chicks, and Breeding Stock Chickens.
First use Feb. 15, 1955.

SN 697,195. Standard Insulation Company, East Rutherford, N. J. Filed Oct. 26, 1955.

STANPREG

For Paper, Glass Cloth, Glass Mat and Woven and Non-Woven Textiles Impregnated With Resins and Used in the Manufacture of Reinforced Laminates for Electrical and Structural Materials.
First use Aug. 26, 1955.

SN 697,398. Pittsburgh Consolidation Coal Company, Pittsburgh, Pa. Filed Oct. 31, 1955.

PINEY FORK

Owner of Reg. No. 621,949.
For Coal.
First use 1903.

SN 697,399. Pittsburgh Consolidation Coal Company, Pittsburgh, Pa. Filed Oct. 31, 1955.

The word "Bradford" is disclaimed apart from the mark as shown. The drawing is lined for red. Owner of Reg. Nos. 336,682, 581,289, and others.
For Coal.
First use Apr. 12, 1955.

SN 697,400. Pittsburgh Consolidation Coal Company, Pittsburgh, Pa. Filed Oct. 31, 1955.

The drawing is lined for red. Owner of Reg. Nos. 336,682, 581,289, and others.
For Coal.
First use June 14, 1955.

SN 697,401. Pittsburgh Consolidation Coal Company, Pittsburgh, Pa. Filed Oct. 31, 1955.

The drawing is lined for red. Owner of Reg. Nos. 336,682, 581,289, and others.
For Coal.
First use June 14, 1955.

SN 697,402. Pittsburgh Consolidation Coal Company, Pittsburgh, Pa. Filed Oct. 31, 1955.

The drawing is lined for the color red. Owner of Reg. Nos. 336,682, 581,289, and others.
For Coal.
First use June 14, 1955.

SN 697,403. Pittsburgh Consolidation Coal Company, Pittsburgh, Pa. Filed Oct. 31, 1955.

CROW HOLLOW

For Coal.
First use July 7, 1955.

SN 697,404. Pittsburgh Consolidation Coal Company, Pittsburgh, Pa. Filed Oct. 31, 1955.

GLEN CASTLE

For Coal.
First use July 7, 1955.

SN 697,405. Pittsburgh Consolidation Coal Company, Pittsburgh, Pa. Filed Oct. 31, 1955.

DUN GLEN

For Coal.
First use July 7, 1955.

SN 697,407. Pittsburgh Consolidation Coal Company, Pittsburgh, Pa. Filed Oct. 31, 1955.

The drawing is lined for red. Owner of Reg. Nos. 336,682, 581,289, and others.
For Coal.
First use Sept. 16, 1955.

SN 697,408. Pittsburgh Consolidation Coal Company, Pittsburgh, Pa. Filed Oct. 31, 1955.

WILLOW GROVE

For Coal.
First use Sept. 16, 1955.

SN 700,780. Borax Consolidated, Limited, d. b. a. Pacific Coast Borax Co., Division of Borax Consolidated, Limited, Los Angeles, Calif., now by change of name Borax (Holdings) Limited, to United States Borax & Chemical Corporation, Los Angeles, Calif. Filed Dec. 29, 1955.

20 MULE TEAM

Owner of Reg. Nos. 50,383, 327,847, and 574,007.
For Elemental Boron in Amorphous Form.
First use Oct. 20, 1955.

SN 189. Borax Consolidated, Limited, d. b. a. Pacific Coast Borax Co., Division of Borax Consolidated, Limited, Los Angeles, Calif., now by change of name Borax (Holdings) Limited, to United States Borax & Chemical Corporation, Los Angeles, Calif. Filed Jan. 5, 1956.

[redacted]

Owner of Reg. Nos. 28,401, 697,749, and others.
For Elemental Boron in Amorphous Form.
First use Oct. 20, 1955.

SN 1,844. British Celanese Limited, London, England. Filed Feb. 1, 1956.

CINEMOID

Owner of British Reg. No. 584,071, dated Mar. 9, 1938.
For Flexible Plastic Sheeting.
First use Jan. 2, 1935.

SN 4,721. Industrias Gracarbon, S. A., Matanzas, Cuba. Filed Mar. 16, 1956.

GRACARBON

For Baked Carbon and Graphite Products.
First use Dec. 11, 1955; in commerce Dec. 11, 1955.

SN 5,087. L. A. Dreyfus Company, Oak Tree, N. J. Filed Mar. 22, 1956.

LADCO BUBBLE BASE

For Chewing Gum Base Not Including Chicle.
First use Aug. 12, 1930.

SN 5,770. Good Bros. Leather Company, Newark, N. J. Filed Apr. 4, 1956.

EVENING DOVE

For Leather.
First use Mar. 9, 1956.

SN 8,401. Garden State Tanning Inc., New York, N. Y. Filed May 16, 1956.

GROVETAN

For Processed Leather Hides.
First use Apr. 20, 1956.

SN 8,403. Garden State Tanning Inc., New York, N. Y. Filed May 16, 1956.

PINEGLOVE

For Processed Leather Hides.
First use Apr. 20, 1956.

SN 8,620. British Celanese Limited, London, England. Filed May 21, 1956.

TRICEL

Owner of British Reg. No. 734,988, dated Oct. 13, 1954.
For Staple Fibres Made Wholly or Partially of Cellulose Derivatives.

SN 8,946. Foam King, Inc., New York, N. Y. Filed May 24, 1956.

VIN-SO-LITE

For Synthetic Sponges Made of Polyvinyl Chloride Foam.
First use May 11, 1956.

SN 9,165. National Lead Company, New York, N. Y. Filed May 28, 1956.

PETRO BOND

For Modified Clay Composition for Molding Sands and Cores and Like Use.
First use Jan. 27, 1956.

SN 9,271. Jessall Plastics, Incorporated, Kensington, Conn. Filed May 29, 1956.

Strip-a-Tube

For Plastic Tubing.
First use Apr. 23, 1956.

## CLASS 3

## BAGGAGE, ANIMAL EQUIPMENTS, PORTFOLIOS, AND POCKETBOOKS

SN 700,920. Wintrim, Inc., New York, N. Y. Filed Dec. 30, 1955.

PARA-TWEET

For Pneumatic Sound Making Toy for Bird Cages.
First use Oct. 24, 1955.

## CLASS 4

## ABRASIVES AND POLISHING MATERIALS

SN 8,115. Burnishine Products Co., d. b. a. J. C. Paul & Co., Skokie, Ill. Filed May 11, 1956.

DRAGON

For Metal Polish.
First use Nov. 1, 1911.

SN 8,247. Merit Products, Inc., Culver City, Calif. Filed May 14, 1956.

ROUND-O-FACE

For Abrading Wheels.
First use Feb. 10, 1956.

## CLASS 5

## ADHESIVES

SN 688,940. Kay See Dental Manufacturing Company, d. b. a. Kay See Mfg. Co., Kansas City, Mo. Filed June 6, 1955.

Joyne

For Liquid and Powder Chemical Compositions Sold as a Unit To Form a Plastic Adhesive Material Used To Repair.
First use Aug. 16, 1954.

SN 5,981. Crown Zellerbach Corporation, San Francisco, Calif. Filed Apr. 9, 1956.

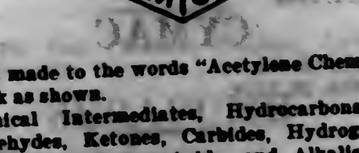
"TALKING TAPE"

For Gummed Tape.
First use Jan. 27, 1956.

SN 7,811. L. C. S. Corporation, d. b. a. Royal Sales and Manufacturing Co., Los Angeles, Calif. Filed May 7, 1956.

For Pressure Sensitive Adhesives.
First use Mar. 13, 1953.

SN 8,306. Adhesive Products Corporation, New York, N. Y. Filed May 15, 1956.



STIX-GRIP

Owner of Reg. No. 441,178.
For Adhesive Waterproof Cements Containing Natural or Synthetic Rubber.
First use Oct. 15, 1954.

## CLASS 6

## CHEMICALS AND CHEMICAL COMPOSITIONS

SN 671,007. Acetylene Chemicals Company, New York, N. Y. Filed Aug. 3, 1954.

No claim is made to the words "Acetylene Chemicals" apart from the mark as shown.
For Chemical Intermediates, Hydrocarbons, Alcohols, Amines, Aldehydes, Ketones, Carbides, Hydrogen, Oxygen, Nitrogen, and Other Gases, Acids, and Alkalis, and Salts Thereof, Hydrocarbon Oils, Metallurgical Reagents, Wetting Agents, Insecticides and Fumigants, Fungicides, Organo-Metallic Compounds, and Catalytic Agents.
First use June 30, 1954.

SN 672,437. Phillips Petroleum Company, Bartlesville, Okla. Filed Aug. 30, 1954.

PHILCURE

For Rubber Vulcanization Accelerator.
First use Feb. 8, 1954.

SN 675,360. Bridgeport Brass Company, Bridgeport, Conn. Filed Oct. 25, 1954.

For Insecticides.
First use July 27, 1954.

SN 686,929. Tex-Gas, Inc., Stillwater, Okla. Filed May 5, 1955.

TEX-GAS

For Liquefied Petroleum Gases and More Particularly To Liquefied Petroleum Gases in Sealed Containers.
First use Aug. 13, 1953.

SN 689,846. Intrusion-Prepakt, Incorporated, Cleveland, Ohio. Filed June 20, 1955.

PREPAKT

Owner of Reg. No. 530,015.
For Admixes for Cement, Concrete, and Grout.
First use March 1943.

SN 695,457. Vestal Laboratories, Inc., St. Louis, Mo. Filed Sept. 27, 1955.

Vespray

For Air Sanitizer and Deodoriser.
First use May 31, 1955.

SN 700,474. The L. Martin Company, New York, N. Y., to Columbian Carbon Company, New York, N. Y. Filed Dec. 22, 1955.

Applicant disclaims the word "Black" apart from the mark as shown.
For Lamp Black Having a General Utility in the Industrial Arts.
First use in 1902.

SN 700,524. Nott Manufacturing Co., Inc., Mount Vernon, N. Y. Filed Dec. 23, 1955. Sec. 2(f).

NOTT'S

Owner of Reg. Nos. 382,879, 411,389, and 434,353.
For Rodenticides, Herbicides, and Insecticides.
First use on or about Apr. 11, 1946, on rodenticides.

SN 700,525. Nott Manufacturing Co., Inc., Mount Vernon, N. Y. Filed Dec. 23, 1955. Sec. 2(f).

Nott's

Owner of Reg. Nos. 352,879, 443,559, 434,353, and others.
For Insecticides, Herbicides, Animal Repellents, and Rodenticides.
First use on or about Jan. 21, 1945, on insecticides.

SN 395. Wyandotte Chemicals Corporation, Wyandotte, Mich. Filed Jan. 9, 1956.

FLOTE

For Formulated, Solid, Alkaline Additive for the Water Wash of Paint Spray Booths, Containing Ingredients Which, Together, Promote the Kill and Float of Oversprayed Coating Materials in Said Water Wash.
First use Dec. 15, 1953.

SN 902. Mud Control Laboratories, Inc., Oklahoma City, Okla. Filed Jan. 17, 1956.

**CONTROLOID**

For Oil Well Drilling Fluid Additives—Namely, Starches for Reducing Water Loss in Drilling Muds.
First use 1951.

SN 2,064. American Steriliser Company, Erie, Pa. Filed Feb. 6, 1956.

**SPORDEX**

For Bacterial Spore Strips Used for Culture Tests in Determining the Efficiency of Sterilization.
First use Jan. 25, 1956.

SN 2,488. Andrew Wilson, Inc., Springfield, N. J. Filed Feb. 27, 1956. Sec. 2(f) as to "Wilson's."

**Wilson's**
**O. K. PLANT SPRAY**

No claim is made to the words "Plant Spray" apart from the mark as shown.
For Insecticides.
First use May 1909.

SN 2,795. Marlowe Chemical Company, New York, N. Y. Filed Feb. 16, 1956.

**RED TOP**

For Chemical Fire Extinguishers.
First use on or about Nov. 1, 1955.

SN 2,806. Olin Mathieson Chemical Corporation, New York, N. Y. Filed Feb. 16, 1956.

The drawing is lined for brown, but color is not an essential feature of the mark.
For Antifreeze, Cooling System Stop-Leak, and Water-Pump Lubricant and Anti-Rust, for Use in Automobile, Truck, and Tractor Engines.
First use Apr. 20, 1955.

SN 3,501. Andrew Wilson, Inc., Springfield, N. J. Filed Feb. 27, 1956.

**AWINC**

For Insecticides.
First use in May 1918.

SN 3,659. Dow Corning Corporation, Midland, Mich. Filed Mar. 1, 1956.

**SYL-MER**

For Compositions Used in the Finishing of Knitted, Netted, and Textile Fabrics.
First use Jan. 4, 1956.

SN 3,672. General Aniline & Film Corporation, New York, N. Y. Filed Mar. 1, 1956.

**EUNAPHTOL**

For Chemical Product To Be Mixed With Dyes, Dyestuffs, or Intermediates in Order To Form a Paste.
First use about Jan. 29, 1929.

SN 3,673. General Aniline & Film Corporation, New York, N. Y. Filed Mar. 1, 1956.

**AKAUSTAN**

Owner of Reg. No. 266,174.
For Solution for Rendering Fireproof Textiles of All Kinds.
First use June 1, 1929.

SN 3,723. American Cyanamid Company, New York, N. Y. Filed Mar. 2, 1956.

**CYMAC**

For Synthetic Resin.
First use Feb. 20, 1956.

SN 3,724. American Cyanamid Company, New York, N. Y. Filed Mar. 2, 1956.

**CYMEL**

For Synthetic Resin.
First use Feb. 20, 1956.

SN 3,748. Gerald Goodman, Massapequa, N. Y. Filed Mar. 2, 1956.

**MICROBACIDE**

For Chemical Preparations—Namely, Agricultural Disinfectants, Germicides, and Antiseptics for Use in the Rubber, Plastic, Leather, Paper, and Textile Industries.
First use Jan. 2, 1956.

SN 6,001. The Hamilton Metal Products Company, Hamilton, Ohio. Filed Apr. 9, 1956.

**Skotch Kooler**

For Preparation for Starting Charcoal Fires.
First use Mar. 8, 1956.

SN 6,333. J. M. Huber Corporation, New York, N. Y. Filed Apr. 13, 1956.

**DURAPEL**

For Pelletized Carbon Black.
First use Mar. 9, 1956.

SN 6,656. Valmor Products Co., Chicago, Ill. Filed Apr. 18, 1956.

**AUNT SALLY'S**

For Incense.
First use Oct. 30, 1956.

SN 6,695. The Dow Chemical Company, Midland, Mich. Filed Apr. 19, 1956.

**DOWPON**

For Weed Killing Composition.
First use Feb. 2, 1956.

SN 6,696. The Dow Chemical Company, Midland, Mich. Filed Apr. 19, 1956.

**RADAPON**

For Weed Killing Composition.
First use Jan. 17, 1956.

SN 6,697. The Dow Chemical Company, Midland, Mich. Filed Apr. 19, 1956.

**REDDON**

For Brush Killing Composition.
First use Mar. 6, 1956.

SN 6,698. The Dow Chemical Company, Midland, Mich. Filed Apr. 19, 1956.

**SERAFUME**

For Grain Fumigant Composition.
First use Mar. 6, 1956.

SN 6,883. West Disinfecting Company, Long Island City, N. Y. Filed Apr. 20, 1956.

**DYNE**

Owner of Reg. Nos. 584,224 and 552,316.
For Chemical Compositions—Namely, Iodine Plus Polyethoxy Polypropoxy Ethanol, in Liquid and Powder Form.
First use Mar. 23, 1956.

SN 6,964. Stewart-Hall Chemical Corp., Mount Vernon, N. Y. Filed Apr. 23, 1956.

**HUMIDEX**

For Chemical Composition in Tablet Form To Prevent Corrosion, Scale, Algae, Rust, and Clogging in Humidifier Tanks.
First use in October 1953.

SN 7,104. National Lead Company, New York, N. Y. Filed Apr. 25, 1956.

**LECTRO "60"**

For Basic Lead Silico-Chloride Complexes Useful as Stabilizers for Vinyl Resins.
First use June 10, 1955.

SN 7,119. The Sherwin-Williams Company, Cleveland, Ohio. Filed Apr. 25, 1956.

**DYPOL**

For Synthetic Resins.
First use Apr. 9, 1956.

SN 7,345. Happy Products Co., Kansas City, Mo. Filed Apr. 30, 1956.

**HAPPY**

For Preparation for Retarding Soiling of Rugs, Carpets, Fabrics, Upholstery, Painted Surfaces, and the Like.
First use Mar. 21, 1956.

SN 7,590. Interchemical Corporation, New York, N. Y. Filed May 3, 1956.

**VALTEX**

For Pigmented Resin Compositions for Application to Textiles and Plastic Films.
First use Mar. 20, 1956.

SN 11,445. Standard Oil Company of California, San Francisco, Calif. Filed July 13, 1956.

Owner of Reg. Nos. 356,109, 533,798, and others.
For Chemicals Used To Prevent the Freezing of Moisture in Storage Tanks and Fuel Systems of Heating Units and Internal Combustion Engines; Insecticidal Carriers and Solvents; Liquefied Petroleum Gas; and Chemical Compounds of High Volatility Useful for Facilitating the Starting of Internal Combustion Engines at Low Temperatures.
First use June 2, 1956, on motor fuel ice preventive.

SN 12,853. Standard Oil Company of California, San Francisco, Calif. Filed Aug. 14, 1956.

Owner of Reg. Nos. 356,109, 533,798, and others.
For Chemicals and Chemical Intermediates for General Use in the Industrial Arts—Namely, Naphthenic Acids and Their Derivatives; Metallic Naphthenates; Purified Sulfonates; Xylol; Mercaptans; Cresylic Acids; Polybutenes; Alkyl Benzenes and Dodecyl Benzenes; Phthalic Anhydride; Metaxylene; Paraxylene; Phenol; Chemical Preparations and Compounds for Use in the Manufacture of Ink, Mildew Preventives and Fungicides, Wood Preservatives, Algaecides, Paint Driers, Textile Oils, Dyestuffs, Synthetic Fibers and Films, Leather Softeners, Adhesives and Mastics, Caulking Compounds, Detergents, Alkyd Resins for Paints and Varnishes, and Plastic Molding Powder; Chemical Preparations and Compounds for Use as Wetting Agents, Water Soluble Emulsifiers, Dispersants, Surface Active Agents, Gas Odorants, Flotation Reagents, Disinfectants, Industrial Germicides, Plasticizers, and Rubber Extenders; Chemical Preparations and Compounds for Coating and Impregnating Materials Used for Electric Insulation; Chemical Preparations and Compounds for Use in Trapping Dust in Air Filters; Catalytic Agents for Use in Petroleum Refining and Chemical Dispersants for Use in Dry Cleaning; Parasiticides—Namely, Insecticides, Germicides, Fungicides, Herbicides, Fumigants, Weedicides, Ovicides, Miticides; Soil Fumigants; Chemical Preparations for the Improvement of Drainage and Water Penetration in Seepage Areas and Fields; Corrosion Inhibitors; Insecticide Deposit Builders; Dusting Sulfurs; Animal Insect Repellents

and Poisons; Sulfur; Flotation Sulfur; Dry Emulsifiers; Spreaders; Insecticidal, Germicidal, and Fungicidal Sprays; Spray Adjuvants; Seed Treating Chemical Preparations; Insecticidal Baits; and Industrial Deodorizers.
First use June 25, 1956.

---

CLASS 9

EXPLOSIVES, FIREARMS, EQUIPMENTS, AND PROJECTILES

---

SN 659,003. Olin Industries, Inc., East Alton, Ill., now by merger and change of name Olin Mathieson Chemical Corporation. Filed Jan. 5, 1954. Sec. 2(f).

BALL POWDER

For Propellant Explosives.
First use on or about Nov. 27, 1940.

---

CLASS 10

FERTILIZERS

---

SN 699,056. Minnesota Farm Bureau Service Company, St. Paul, Minn. Filed Sept. 21, 1956.

Veg-E-Gro

The drawing is lined for black but no claim is made to color.
For Fertilizers.
First use Mar. 1, 1954.

---

SN 700,484. The Smith Agricultural Chemical Company, Columbus, Ohio. Filed Dec. 22, 1955.

TUFF-TURF

For Fertilizers.
First use Sept. 1, 1955.

---

SN 7,003. J. & L. Adikes, Inc., Jamaica, N. Y. Filed May 9, 1956. Sec. 2(f).

GRO-WELL

For Fertilizer.
First use July 1, 1932.

---

CLASS 12

CONSTRUCTION MATERIALS

---

SN 692,069. The Zimmerman Company, Columbus, Ohio. Filed Aug. 8, 1955.

PLASTEXPANEL

Owner of Reg. No. 530,916.
For Plastic Wallboard.
First use July 15, 1955.

SN 700,534. Seaporcel Metals, Inc., Long Island City, N. Y. Filed Dec. 23, 1955.

SEAPORCEL

Owner of Reg. Nos. 403,972 and 581,003.
For Architectural Porcelain Enamel Parts—Namely, Enamel Sheets and Panels Used as Exterior Veneer for All Types of Buildings and for Other Related Uses Such as in the Manufacture of Commercial and Neon Signs.
First use in February 1942.

---

SN 5,134. Reynolds Metals Company, Richmond, Va. Filed Mar. 23, 1956.

ReyconoWall

For Insulated Field-Assembled Curtain Wall.
First use Feb. 2, 1956.

---

SN 5,968. Astoria Marine Construction Company, d. b. a. Astoria Manufacturing Co., Astoria, Oreg. Filed Apr. 9, 1956.

REDLAM

For Laminated Wood Rafters and Beams.
First use Nov. 23, 1955.

---

SN 7,233. Bemis Bro. Bag Company, Minneapolis, Minn. Filed Apr. 27, 1956.

BEMISWALL

For Vertically Hung Folding Partitions, Walls, and Doors, Including the Necessary Supporting Hinges, Tracks, and Trolleys.
First use Mar. 22, 1955.

---

SN 7,234. Howard Roy Scott and Wallace A. Scott, d. b. a. Bord-A-Blox Company, Tampa, Fla. Filed Apr. 27, 1956.

BORD-A-BLOX

For Composition Block of Different Designs for Edging Paths, Flower Beds, and the Like.
First use Oct. 10, 1955.

---

SN 7,284. Solar Aircraft Company, San Diego, Calif. Filed Apr. 27, 1956.

BRYTANEAL

For Ceramic Coatings.
First use Mar. 30, 1956.

---

SN 7,388. Smith Manufacturing Company Limited, Weston, Ontario, Canada. Filed Apr. 30, 1956.

FOAMFLEX

Owner of Canadian Reg. No. N. S. 189/48066, dated May 21, 1954.
For Weatherstripping.

CLASS 13

HARDWARE AND PLUMBING AND STEAM-FITTING SUPPLIES

---

SN 689,312. Spence Engineering Company, Inc., Walden, N. Y. Filed June 10, 1955. Sec. 2(f) as to "Spence."

Spence

Owner of Reg. No. 619,223.
For Regulators for Steam or Other Vapors, Gases, and Liquids.
First use Feb. 28, 1955.

---

SN 700,481. Safety Socket Screw Company, Chicago, Ill. Filed Dec. 22, 1955.

LED-LOK

For Self-Locking Screw Product.
First use on or about July 19, 1954.

---

SN 700,834. Radiator Specialty Company, Charlotte, N. C. Filed Dec. 15, 1955.

SEAL-O-MATIC

For Toilet Bowl Flush Control Units.
First use Nov. 17, 1955; Nov. 2, 1954, as to "Seal-O-Matic."

---

SN 7,296. United States Steel Corporation, Pittsburgh, Pa. Filed Apr. 27, 1956.

AMERICAN

Owner of Reg. Nos. 144,096, 297,446, and 344,080.
For Wire Fencing, Barb Wire, Tie Wire, and Poultry Netting.
First use July 1, 1898, on wire fencing.

---

SN 9,851. The Everedy Company, Frederick, Md. Filed June 8, 1956.

EVEREDY Speedi-Heat

For Base Metal Hollow Cookware Consisting of Fry Pans, Saucepans, Double Boilers, Egg Poachers, Saucepots, Chicken Fryers, and Dutch Ovens.
First use Apr. 24, 1956.

---

SN 9,918. International Plumbing Manufacturing Co., Inc., New York, N. Y. Filed June 11, 1956.

TUFF-BOY

For Faucet Washers.
First use June 1953.

---

SN 9,939. Bonney Forge & Tool Works, Allentown, Pa. Filed June 11, 1956.

SCREWDOLET

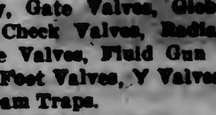
For Unions for Welded and Threaded Connections.
First use Mar. 12, 1956.

SN 9,943. Calumet & Hecla, Inc., Chicago, Ill. Filed June 11, 1956.

CORRO-TUBE

For Metal Tubing.
First use Apr. 19, 1956.

---



SN 9,985. Ideal Fastener Corporation, Long Beach, N. Y. Filed June 11, 1956.

EVERZIP

For Slide Fasteners and Slide Fastener Assemblies.
First use May 21, 1956.

---

SN 10,013. Officine Metallurgiche Sgarbi Chiesi & C., Ferrara, Italy. Filed June 11, 1956.

Owner of Italian Reg. No. 104,426, dated Nov. 20, 1951.
For Coffee-Makers.

---

SN 10,137. The Colorado Fuel and Iron Corporation, Denver, Colo. Filed June 13, 1956.

LOK-LINE

For Poultry Netting.
First use May 23, 1956.

---

SN 10,150. The Enterprise Aluminum Company, Massillon, Ohio. Filed June 13, 1956.

famous chef

Owner of Reg. No. 585,428.
For Aluminum Kitchen Utensils—Namely, Combination Cookers, Covered Sauce Pans, Covered Sauce Pots, Dutch Ovens, Covered Fry Pans, Covered Chicken Fryers, Egg Poachers, and Casseroles.
First use June 1, 1956.

---

SN 10,189. Novelty Tool Co., Spencer, Mass. Filed June 13, 1956.

FLEX-C-RING

For Hog Ring or C Clip.
First use Mar. 30, 1956.

---

SN 10,321. Jenkins Bros., New York, N. Y. Filed June 15, 1956.

Owner of Reg. Nos. 22,238, 593,531, and others.
For Metal Valves for Fluid Conducting Installations for Conducting Steam, Water, Oil, Air, Gas, Chemicals, and Other Fluids—Namely, Gate Valves, Globe Valves, Angle Valves, Cross Valves, Check Valves, Radiator Valves, Self-Closing Valves, Whistle Valves, Fluid Gun Valves, Air Gun Valves, Safety Valves, Foot Valves, Y Valves, Filter Valves, Blow-Off Valves, and Steam Traps.
First use May 1, 1956.

SN 10,235. Mueller Co., Decatur, Ill. Filed June 15, 1956.

**EXTROSEAL**

For Gas Service Valves.
First use Apr. 11, 1956.

## CLASS 15

## OILS AND GREASES

SN 698,063. Minnesota Farm Bureau Service Company, St. Paul, Minn. Filed Sept. 21, 1956.

**GOPHER-PENN**

The drawing is lined for the color black but color is not claimed as part of the mark.
For Oils and Greases.
First use Mar. 1, 1939.

SN 698,064. Minnesota Farm Bureau Service Company, St. Paul, Minn. Filed Sept. 21, 1956.

**GOPHER BOND**

The drawing is lined for the color black but color is not claimed as part of the mark.
For Oils and Greases.
First use Mar. 1, 1939.

SN 699,597. S. A. R. O. M. Societa Azionaria Raffinazione Olii Minerali, Milan, Italy. Filed Dec. 7, 1955.

Saron **99**

Priority claimed under Sec. 44(d) on Italian application, filed June 10, 1955; Reg. No. 125,433, dated Nov. 5, 1955. The number "99" is disclaimed apart from the mark as shown.
For Motor Fuels, Diesel Oil, Gasoil, Kerosene, Stove Oil.

SN 1,612. Menorah, Rubenstein Bros., Tel-Aviv, Israel. Filed Jan. 27, 1956.

Owner of Israelian Reg. No. 13,187, dated Oct. 11, 1953.
For Candles.
First use 1936; in commerce 1949.

## CLASS 16

## PROTECTIVE AND DECORATIVE COATINGS

SN 699,740. Pratt & Lambert-Inc., Buffalo, N. Y. Filed Dec. 9, 1955.

*Calibrated Colors*

No claim is made to exclusive use of the word "Colors" apart from the mark shown.
For Colorant Added to Base Enamel, Paint, or Wall Covering, To Obtain a Finished Colored Product.
First use Sept. 8, 1955.

SN 5,851. La France Manufacturing Co., St. Louis, Mo. Filed Apr. 5, 1956.

**FRANKOTE**

For Chemical Composition in Liquid or Powder Form for Producing a Protective Coating on Metal.
First use June 1955.

## CLASS 18

## MEDICINES AND PHARMACEUTICAL PREPARATIONS

SN 644,670. Heyden Chemical Corporation, New York, N. Y., to Multibiotics Corporation of America, Baltimore, Md. Filed Apr. 3, 1953.

**MULTIBIOTIC**

For Antibiotic Impregnated Gauze Pads and Bandages for Use as Sterile Dressings, and Mixtures of Antibiotics.
First use November 1951 on antibiotic impregnated pads.

SN 669,110. General Electric Company, Milwaukee, Wis. Filed June 29, 1954.

**VERI-O-PAKE**

For Mixture of Barium Sulfate and Other Ingredients, Including Pectin.
First use in or about July 1949.

SN 669,919. Schenley Distillers, Inc., New York, N. Y. Filed July 13, 1954.

**FERMAGENE**

For Feed Supplement for Poultry and Cattle.
First use Mar. 8, 1954.

SN 693,121. Brett Pharmaceuticals, Inc., Richmond, Va. Filed Aug. 16, 1955.

The drawing is lined for red but no claim is made to the color red.
For Antispasmodic Tablets.
First use Aug. 22, 1951.

SN 698,543. The Norwich Pharmacal Company, Norwich, N. Y. Filed Nov. 18, 1955.

**SUPER-GEL**

For Laxative Preparation.
First use Nov. 4, 1955.

SN 543. C. H. Boehringer Sohn, Ingelheim am Rhine, Germany. Filed Jan. 12, 1956.

**ALCAIN**

Owner of German Reg. No. 239,888, dated Oct. 2, 1925.
For Local Anesthetic.

SN 544. C. H. Boehringer Sohn, Ingelheim am Rhine, Germany. Filed Jan. 12, 1956.

**BEROMYCIN**

Owner of German Reg. No. 650,344, dated Dec. 19, 1953.
For Medicines, i. e. Antibiotics.

SN 545. C. H. Boehringer Sohn, Ingelheim am Rhine, Germany. Filed Jan. 12, 1956.

**CENTALUN**

Owner of German Reg. No. 339,889, dated Oct. 2, 1925.
For Sedative and Hypnotic Preparations.

SN 547. C. H. Boehringer Sohn, Ingelheim am Rhine, Germany. Filed Jan. 12, 1956.

**DETORMENT**

Owner of German Reg. No. 394,016, dated Nov. 7, 1928.
For Analgesic.

SN 552. C. H. Boehringer Sohn, Ingelheim am Rhine, Germany. Filed Jan. 12, 1956.

**LONARID**

Owner of German Reg. No. 502,005, dated May 5, 1938.
For Preparation for Treating Common Colds.

SN 2,483. Alex B. Del Bueno, d. b. a. Dell & Holtz, Plainfield, N. J. Filed Feb. 2, 1956.

**NUE**

For Antiseptic Mouthwash Gargle Concentrate.
First use Feb. 2, 1948.

SN 3,444. Moorman Manufacturing Company, Quincy, Ill. Filed Feb. 27, 1956.

**MOORMABOOST**

Owner of Reg. Nos. 354,501 and 513,104.
For Livestock and Poultry Feed Supplement Containing an Antibiotic Vitamin.
First use Jan. 13, 1956.

SN 4,118. Foster-Milburn Company, Buffalo, N. Y. Filed Mar. 8, 1956.

**SEBULYTIC**

For Special Combination of Cleansing and Wetting Agents for Use in a Medicinal Preparation for the Treatment of Seborrheic Dermatitis and Acne.
First use Mar. 1, 1956.

SN 5,046. Parke, Davis & Company, Detroit, Mich. Filed Mar. 22, 1956.

**CIROTYL**

Owner of Reg. No. 618,111.
For Laxative.
First use Sept. 13, 1955.

SN 6,137. Societe des Usines Chimiques Rhone-Poulenc, Paris, France. Filed Apr. 10, 1956.

**STEMETIL**

Priority claimed under Sec. 44(d) on French Reg. No. 456,521, dated Mar. 16, 1956 (Paris); Natl. Inst. No. 70,752.
For Medicinal or Pharmaceutical Preparation for Use as a Tranquilliser, Prevention of Nausea, and Treatment of Headaches.

SN 7,479. Bristol Laboratories Inc., New York, N. Y. Filed May 2, 1956.

**POLYNIZED**

For Antibiotic Pharmaceutical Preparation.
First use Dec. 23, 1955.

SN 7,603. Lakeside Laboratories, Inc., Milwaukee, Wis. Filed May 3, 1956.

**CATRON**

For Tablet Medication Intended for the Relief of Tension.
First use Mar. 29, 1956.

SN 7,604. Lakeside Laboratories, Inc., Milwaukee, Wis. Filed May 3, 1956.

**DITRAL**

For Tablet Medication Intended for Anti-Convulsant Therapy.
First use Mar. 29, 1956.

SN 7,624. Professional Pharmacal Co., Inc., San Antonio, Tex. Filed May 3, 1956.

CELOCAINE

For Ophthalmic Preparation.
First use Apr. 3, 1956.

SN 8,717. Smith Kline & French Laboratories, Philadelphia, Pa. Filed May 21, 1956.

**COMPAZINE**

For Central Nervous System Depressant Especially Useful as an Anti-Nauseant and Sedative.
First use May 10, 1956.

SN 11,450. Standard Oil Company of California, San Francisco, Calif. Filed July 13, 1956.

Owner of Reg. Nos. 256,109, 533,796, and others.
For Chemical Preparation for Veterinary Use as an Antiseptic and Germicide.
First use June 4, 1956.

SN 15,401. A. H. Robins Company, Inc., Richmond, Va. Filed Sept. 10, 1956.

NEURAXIN

For Muscle Relaxant Medicinal Preparation.
First use May 10, 1956.

CLASS 19

VEHICLES

SN 2,468. Northern States Equipment, Inc., d. b. a. Northern States Marine, and N. S. M., Richland Center, Wis. Filed Feb. 10, 1956.

SabreCraft

For Marine Watercraft of the Small Boat Type and Boat Oars.
First use Apr. 18, 1955.

SN 9,142. Goliath-Werk G. m. b. H., Bremen, Germany. Filed May 28, 1956.

GOLIATH

For Automotive Vehicles—Namely, Passenger Vehicles, Trucks, Tricycles for Use by Adults, Truck Tractors and Structural Parts Thereof.
First use Oct. 25, 1955; in commerce Oct. 25, 1955.

CLASS 21

ELECTRICAL APPARATUS, MACHINES, AND SUPPLIES

SN 643,729. Siemens-Schuckertwerke Aktiengesellschaft, Erlangen, Germany. Filed Mar. 16, 1953.

Protos

Owner of German Reg. No. 362,212, dated Jan. 10, 1927.
For Electrical Appliances—Namely, Vacuum Cleaners, Fans, Kitchen Ranges, Hot Plates, Roasters, Toasters, Space Heaters, Immersion Heaters, Heating Pads, Flat Irons, Water Heaters, House Service Pumps, and Electric Components and Electric Wiring and Control Accessories for Said Electric Appliances.

SN 663,954. The Antenna Specialists Company, Cleveland, Ohio. Filed Mar. 22, 1955.

BASEBALL

Owner of Reg. No. 391,075.
For Antennas.
First use on or about Feb. 18, 1955.

SN 687,281. Gramer-Halldorson Transformer Corporation, Chicago, Ill. Filed May 11, 1955.

MINIFORMER

Owner of Reg. No. 596,469.
For Transformers, Particularly Transformers Adapted for Use With Transistors.
First use Apr. 18, 1955.

SN 691,002. Bourns Laboratories, Inc., Riverside, Calif. Filed July 11, 1955.

RESISTRON

For Electrical Resistance Elements.
First use Jan. 22, 1954.

SN 696,783. Electriduct Company, Casper, Wyo. Filed Oct. 20, 1955.

ELECTRIDUCT

For Electric Extension Cord.
First use July 28, 1955.

SN 697,695. Pacific Solenoids, Inc., El Segundo, Calif. Filed Nov. 4, 1955.

PACSOL

For Torque or Rotary Solenoids.
First use Oct. 4, 1955.

SN 697,751. Balanced Foods, Inc., New York, N. Y. Filed Nov. 7, 1955.

BALANCED FOOD

For Electric Juicer.
First use on or about Sept. 1, 1955.

SN 697,752. Balanced Foods, Inc., d. b. a. Extract-All Co., New York, N. Y. Filed Nov. 7, 1955.

EXTRACT-ALL

For Electric Juicer.
First use on or about Sept. 1, 1955.

SN 698,349. General Motors Corporation, Detroit, Mich. Filed Nov. 16, 1955.

WONDER BAR

For Radio Receiving Sets and Parts Thereof for Motor Vehicles.
First use Nov. 7, 1955.

SN 698,394. United States Rubber Company, New York, N. Y. Filed Nov. 16, 1955.

USCOR

For Electrical Wire and Cables.
First use Oct. 31, 1955.

SN 698,433. Integra AG. Zurich Industrietechnische Gesellschaft, Zurich, Switzerland. Filed Nov. 17, 1955.

DOMINO

Priority claimed under Sec. 44(d) on Swiss Reg. No. 156,079, dated May 18, 1955.
For Electric Control Panels Destined for Interlocking Systems for Railways, Electric Remote Control Systems for Sluices and Mines; Electric Transmitting and Electric Intercommunicating Systems.

SN 699,058. Cambridge Thermionic Corporation, Cambridge, Mass. Filed Nov. 29, 1955.

PERMA-TORQ

For Electrical Components With Mounts—Namely, Capacitors and Coil Forms.
First use Aug. 3, 1956.

SN 699,062. Krim-Ko Corporation, Chicago, Ill. Filed Nov. 29, 1955.

KRIM-KOLATOR

Owner of Reg. Nos. 267,360 and 442,075.
For Hot Beverage Dispenser With Electrically Driven Agitator.
First use on or about Sept. 17, 1954.

SN 699,361. Burndy Engineering Company, Inc., Norwalk, Conn. Filed Dec. 5, 1955.

UNILOK

For Multiple Electrical Connection Panel for Mounting in the Bulkhead of a Pressurized Aircraft.
First use July 15, 1954.

SN 699,962. Electric Power Door Company, Inc., Minneapolis, Minn. Filed Dec. 14, 1955.

Electric Doorman

For Electric Operators for Opening Garage Doors and the Like.
First use July 18, 1930.

SN 700,455. Integra Ag. Zürich Industrietechnische Gesellschaft, Zurich, Switzerland. Filed Dec. 22, 1955.

INTEGRA

Owner of Swiss Reg. No. 134,631, dated Aug. 4, 1950.
For Electric Railway Signalising and Control Apparatus, and Parts Thereof.

SN 700,653. Reeves Equipment Corporation, New York, N. Y. Filed Dec. 27, 1955.

GRAMPIAN

For Feedback Cutter Heads, Amplifiers and Power Units for Use With Cutter Heads To Reduce Distortion and To Stabilise Operation in Sound Recording Systems.
First use 1951.

SN 700,795. Kord Manufacturing Co., Inc., New York, N. Y. Filed Dec. 29, 1955.

KATON

For Electric Appliances—Namely, Pedestal Fans, Desk Fans, Hassock Fans, Window Fans, Portable Stoves, Combination Fans and Heaters, Casserole Skillets, Cooker-Fryers, and Pressing Irons.
First use Sept. 15, 1955.

SN 440. Pickering Associates, Inc., Oceanside, N. Y. Filed Jan. 10, 1956. Sec. 2(f).

PICKERING

For Sound Reproducers, Specifically Phonograph Pickup Cartridges; Styli and Styli Assemblies for Phonograph Pickup Cartridges; Amplifiers and Pre-Amplifiers; Audio Input Systems; Recording Equalisers; Phonograph and Solenoids.
First use in or about June 1948.

SN 441. Pickering Associates, Inc., Oceanside, N. Y. Filed Jan. 10, 1956.

For Sound Reproducers, Specifically Phonograph Pickup Cartridges; Styli and Styli Assemblies for Phonograph Pickup Cartridges; Amplifiers and Pre-Amplifiers; Audio Input Systems; Recording Equalisers; Phonograph Tone Arms; Loudspeakers and Solenoids.
First use in or about August 1946.

SN 442. Pickering Associates, Inc., Oceanside, N. Y. Filed Jan. 10, 1956.

FLUXVALVE

For Sound Reproducers, Specifically Phonograph Pickup Cartridges, and Styli and Styli Assemblies for Phonograph Records.
First use in or about May 1955.

SN 574. Commercial Controls Corporation, Rochester, N. Y. Filed Jan. 12, 1956.

TELEDATA

For Printing Telegraph Communication Equipments, Including Code Converters and Reconverters Therefor.
First use Nov. 11, 1955.

SN 854. Walker Electrical Company, Inc., Atlanta, Ga. Filed Jan. 16, 1956.

Uni-Pak

For Fusible Electrical Service Entrance Equipment—Namely, Fuse Panels, Switches, Circuit Makers and Breakers, Boxes, and Covers.
First use Nov. 9, 1955.

SN 1,263. Fred A. Niles Productions, Inc., Chicago, Ill. Filed Jan. 23, 1956.

CAMTRONIC

For Parallex Correction Plate, Provided With Cams and Gears, for Synchronously Coupling a Motion Picture and Tele-

vision Camera and Used in Connection With Filming Shows for Television.
First use Jan. 13, 1956.

---

SN 2,363. Kourtesy Kontrol Co., Des Moines, Iowa. Filed Feb. 9, 1956.

KOURTESY KONTROL

For Electric Control Apparatus for Visually Indicating the Occupied or Vacant Status of a Public Rest Room at a Location Remote From the Rest Room and for Providing a Remote Control for the Rest Room Door.
First use on or about Jan. 24, 1956.

---

SN 2,499. Carpenter Manufacturing Company, Boston, Mass. Filed Feb. 13, 1956.

AUTOMATALITE

For Battery Operated Automatic Emergency Lights.
First use Jan. 9, 1956.

---

SN 2,518. Gerhard Richard Fisher, East Palo Alto, Calif. Filed Feb. 13, 1956.

Tel-O-Aid

For Telephone Amplifiers.
First use Nov. 15, 1955.

---

SN 2,921. Socony Mobil Oil Company, Inc., New York, N. Y. Filed Feb. 17, 1956.

MOBILECT

Owner of Reg. Nos. 129,237, 601,132, and others.
For Electrical Insulating Oils.
First use Dec. 28, 1955.

---

SN 3,002. Matsushita Denki Sangyo Kabushiki Kaisha, Kadoma-cho, Kitakawachi-gun, Osaka Prefecture, Japan. Filed Feb. 20, 1956.

PanaSonic

Priority claimed under Sec. 44(d) on Japanese application No. 27,134/1955, filed Oct. 5, 1955; Reg. No. 483,598, dated June 29, 1956.
For Loud Speakers and Microphones and Other Public Address Systems, and Magnetic Recorders.

---

SN 6,484. Tweco Products Company, Wichita, Kans., to Tweco Products, Inc., Wichita, Kans. Filed Apr. 16, 1956.

TWECO-LITE

Owner of Reg. Nos. 545,200 and 545,201.
For Insulated Electrical Conduit Made of Twisted Aluminum Wire Strands.
First use Jan. 21, 1955.

---

SN 9,501. Allen Ro-Tana Company, Biloxi, Miss. Filed June 4, 1956.

ALLEN RO-TANA

For Antenna Rotors.
First use Jan. 1, 1954.

SN 9,738. Phelps Dodge Copper Products Corporation, New York, N. Y. Filed June 6, 1956.

PERMA-DURE

For Electric Cables.
First use on or about Sept. 28, 1954.

---

SN 9,740. Phelps Dodge Copper Products Corporation, New York, N. Y. Filed June 6, 1956.

Foamflex

For Electric Cables.
First use on or about Nov. 18, 1955.

---

SN 9,923. Allen Electric and Equipment Company, Kalamazoo, Mich. Filed June 11, 1956.

TRU-CHARGE

For Battery Chargers.
First use May 2, 1956.

---

SN 10,040. Trio Manufacturing Co., Griggsville, Ill. Filed June 11, 1956.

ZEPHYR

For Television Antennas.
First use May 27, 1955.

---

SN 10,041. Trio Manufacturing Co., Griggsville, Ill. Filed June 11, 1956.

ZEPHYR ROYAL

For Television Antennas.
First use Aug. 19, 1955.

---

SN 10,104. Radio Corporation of America, New York, N. Y. Filed June 12, 1956.

Memoplay

For Electronic Device for the Recording and Reproduction of Sounds.
First use Mar. 5, 1956.

---

CLASS 22

GAMES, TOYS, AND SPORTING GOODS

---

SN 673,121. Parker Brothers, Inc., Salem, Mass. Filed Sept. 13, 1954.

HOLLYWOOD GO

For Board Game Played With Movable Pieces.
First use Mar. 8, 1954.

SN 680,660. Chicago Roller Skate Company, Chicago, Ill., to The Chicago Roller Skate Company, Chicago, Ill. Filed Jan. 28, 1955.

"CHICAGO"
GOLD MEDALIST

Owner of Reg. Nos. 400,292, 511,987, and 563,043.
For Roller Skates.
First use Dec. 17, 1954.

---

SN 6,735. Louis Marx & Company, Inc., New York, N. Y. Filed Apr. 19, 1956.

BIG BRAIN

For Toy Vehicles.
First use Apr. 4, 1956.

---

SN 6,897. Bromo-Mint Co., Inc., d. b. a. Kenner Products Company, Cincinnati, Ohio. Filed Apr. 23, 1956.

TrickSquirt

For Water Pistols.
First use Mar. 13, 1956.

---

SN 7,255. M. B. Lamar, Sr., Falls Church, Va. Filed Apr. 27, 1956.

MONEY BACK LURES

No claim is made to the word "Lures" apart from the mark as shown.
For Artificial Fish Lures.
First use in February 1955.

---

SN 7,317. Chant and Allen Enterprises, Minneapolis, Minn. Filed Apr. 30, 1956.

BUMPSEY

For Board Game Employing Playing Pieces and Dice for Determining the Movement of the Pieces on the Board.
First use Apr. 24, 1956.

---

SN 7,810. Bernard J. Koreen, Port Arthur, Ontario, Canada. Filed May 7, 1956.

SKIRMISH

Owner of Canadian Reg. No. 102,320, dated Jan. 6, 1956.
For Games of Skill and Chance Employing Toys and Pegs Placed in a Player's Board.

---

SN 8,035. J. Chein & Company, Burlington, N. J. Filed May 10, 1956.

COL-R-TONE

For Spinning Tops.
First use Jan. 16, 1956.

---

SN 8,365. Tudor Metal Products Corporation, Brooklyn, N. Y. Filed May 15, 1956.

tudor

For Football Games, Baseball Games, Basketball Games, Horse Racing Games, and Musical Toys.
First use Apr. 20, 1940, on musical toys.

CLASS 23

CUTLERY, MACHINERY, AND TOOLS, AND PARTS THEREOF

---

SN 663,921. Paul Kobler, d. b. a. Kobler Shaver Co., Lynbrook, N. Y. Filed Apr. 5, 1954.

For Electric Shavers.
First use April 1950.

---

SN 673,157. Arrow Tools, Incorporated, Chicago, Ill. Filed Sept. 14, 1954.

Arrow

For Chisels for Use With Pneumatic Drive Tools; Moisture and Dirt Traps, Regulators, and Lubricators for Use on Pneumatic Lines and Parts Therefor.
First use Jan. 1, 1914.

---

SN 680,171. John Ahlin and Sons, Incorporated, Bridgeport, Conn. Filed Jan. 20, 1955.

PENGUIN PETE

For Scissors.
First use Nov. 29, 1954.

---

SN 700,138. Union Manufacturing Company, New Britain, Conn. Filed Dec. 16, 1955.

UNION MFG. CO. NEW BRITAIN, CONN. U.S.A.

Owner of Reg. Nos. 515,620 and 125,852.
For Die Sets.
First use Nov. 1, 1955.

---

SN 700,456. International Harvester Company, Chicago, Ill. Filed Dec. 22, 1955. Sec. 2(f).

ReNEWed

For Parts for Motor Vehicles Including Wheel-Brake Booster Cylinders, Carburetors, Clutch Discs, Clutch Pressure Plates, Water Pump Assemblies and Engine Crankshafts.
First use May 15, 1951.

---

SN 700,917. R. Wallace & Sons Manufacturing Company, Wallingford, Conn. Filed Dec. 30, 1955.

SAYBROOK

For Stainless Steel Flatware, i. e., Knives, Forks, and Spoons.
First use Dec. 5, 1955.

SN 460. Utica Cutlery Company, Utica, N. Y. Filed Jan. 10, 1956.

## SUMMIT

For Table Knives, Forks and Spoons, and Pie Knives, All of Base Metal.
First use Oct. 10, 1955.

SN 3,555. Sepraton (New Jersey), Inc., New York, N. Y. Filed Feb. 28, 1956.

## CAVIMAT

For Processing Machines.
First use Jan. 19, 1956.

SN 5,027. Chore-Time Equipment, Inc., Milford, Ind. Filed Mar. 22, 1956.

## EGG QUEEN

For Egg Washing Machines.
First use Nov. 3, 1955.

SN 6,470. Robins Industries Corp., Bayside, N. Y. Filed Sept. 18, 1956.

## GIBSON GIRL

For Hand-Operated Devices for Cutting and Splicing Recording Tapes.
First use Aug. 6, 1954.

SN 7,964. H. A. Astlett & Co. Inc., New York, N. Y. Filed May 9, 1956.

## JAKOPA

For Sausage Meat Cutting Knives.
First use May 25, 1955.

SN 7,972. William H. Field Co., Inc., Boston, Mass. Filed May 9, 1956.

For End Mill Grinders, Cutter Grinders, and Accessories, and Parts Thereof.
First use Mar. 6, 1956.

SN 8,047. Airosprayer Company, Neodesha, Kans., to J. Leon Fawcett, Neodesha, Kans. Filed May 10, 1956.

## SPRAYMATE

For Sprayers for Insecticide and the Like.
First use Dec. 2, 1955.

SN 8,059. Club Razor & Blade Mfg. Co., Newark, N. J. Filed May 10, 1956.

Applicant disclaims the words "Double Edge," "Highest Quality," and "Blue Razor Blades."
For Razor Blades.
First use Dec. 10, 1948.

SN 8,081. Kent-Moore Organization, Inc., Detroit, Mich. Filed May 10, 1956.

## KM

Owner of Reg. No. 557,481.
For Hand, Cutting, Reaming, Cleaning, Tightening, Bending, Driving, Pulling, Lifting, Aligning, Inserting, Compressing, Clamping, Holding and Work Piece Supporting Tools for Use in the Service and Repair of Diesel Engines, Injectors, Fuel Pumps, Water Pumps, Oil Pumps, Blowers, Clutches, Power Take-Off Devices, Governors, Torque Converters, Gear Boxes and Transmissions.
First use on or about Jan. 1, 1942.

SN 8,146. Oneida Ltd., Oneida, N. Y. Filed May 11, 1956.

## SHORELINE

For Stainless Steel Flat Tableware.
First use Apr. 17, 1956.

SN 8,279. Superior Scaffold Company, Culver City, Calif. Filed May 14, 1956.

## FEATHER ROD

For Plasterers' Hand Finishing Tool.
First use on or about Apr. 27, 1956.

SN 8,303. Floyd M. Williamson, Detroit, Mich. Filed May 14, 1956.

## Didro

For Intensifier Units for Presses and Mechanisms for Controlling Movement of Pads in Dies.
First use Dec. 12, 1955.

SN 8,304. Wilson Jones Company, Chicago, Ill. Filed May 14, 1956.

## BUDDY JR.

For Stapling Machines.
First use Sept. 12, 1955.

SN 8,380. Auto Electric & Service Corporation, Detroit, Mich. Filed May 16, 1956.

## DELMAR

For Carburetors.
First use Apr. 27, 1956.

SN 8,442. Scott-Atwater Manufacturing Company, Minneapolis, Minn. Filed May 16, 1956. Sec. 2(f).

## Scott-Atwater

For Outboard Motors.
First use 1946.

SN 8,638. The Dunham Company, Berea, Ohio. Filed May 21, 1956.

## CULTI-STUBBLE TREADER

For Agricultural Implement for Mulching.
First use on or about Apr. 1, 1954.

SN 8,696. Reed Roller Bit Company, Houston, Tex. Filed May 21, 1956.

For Roller Type Earth Drilling Bits; Scrape Type Earth Drilling Bits; Bit Break Out Plates for Receiving and Holding Earth Drilling Bits While Connecting and Disconnecting Them From Drill Stems; Tool Joints for Drill Stems; Earth Drilling Core Bits and Wire Line Retractable Core Barrels Therefor, Both Protruding and Non-Protruding Types; Drill Collars; Drilling Substitutes Such as Threaded Coupling Joints or Members; Earth Bore Hole Reamers; Earth Drilling Pilot Bits; Earth Drilling Core Bits and Non-Retractable Core Barrels for Use Therewith; Earth Drilling Basket Bits Adapted To Trap and Remove Lost Non-Drillable Parts From an Earth Bore Hole; and Parts Therefor.
First use in January 1953.

SN 8,777. E. D. Jones and Sons Company, Pittsfield, Mass. Filed May 22, 1956. Sec. 2(f).

## JONES

For Paper Making Machinery—Namely, Beaters and Rolls Therefor, Jordans and Fillings and Plugs Therefor, Refiners and Plugs Therefor, Screens, Pulpers, Disintegrators, Washers, Bleachers, Dusters, Chests, Slices, and Filters.
First use during 1947.

SN 9,210. R. Wallace & Sons Manufacturing Company, Wallingford, Conn. Filed May 26, 1956.

## KUNGSHOLM

For Stainless Steel Flatware—i. e., Knives, Forks, and Spoons.
First use May 5, 1956.

SN 9,391. Roy H. Poorman, d. b. a. Poorman Aircraft Service, Canton, Ohio. Filed May 31, 1956.

## HANGAR BOY

For Windlass for Air and Water Craft.
First use Feb. 20, 1956.

SN 9,419. Raymond Woomer, Glencoe, Minn. Filed May 31, 1956.

## GRIND-O-MIX

For Combination Hammer Mills and Mixers.
First use Mar. 24, 1956.

SN 9,915. Gardner-Denver Company, Denver, Colo. Filed May 23, 1956.

## K-MATIC

For Feeding Devices for Drills.
First use Mar. 28, 1956.

### CLASS 26

### MEASURING AND SCIENTIFIC APPLIANCES

SN 667,983. Robertson Photo-Mechanix, Inc., Chicago, Ill. Filed June 9, 1954.

## MASK-O-MATIC

For Cameras.
First use on or about May 19, 1954.

SN 672,891. Herbert George Company, Chicago, Ill. Filed Sept. 8, 1954.

## IMPERIAL GREY-REFLEX

The term "Reflex" is disclaimed when used separate and apart from the mark.
For Cameras and Parts Thereof.
First use Aug. 25, 1954.

SN 678,505. B & H Instrument Company, Incorporated, Fort Worth, Tex. Filed Dec. 17, 1954.

For Devices for Testing Heat Sensing Units.
First use Aug. 16, 1954; and on Apr. 19, 1954, as to "Takcal."

SN 679,577. Heyer Industries Incorporated, Belleville, N. J. Filed Jan. 7, 1955.

## MOTOR X-RAY

For Electrically Operated Apparatus for Testing and Indicating General Efficiency and Condition of Internal Combustion Engines in Conjunction With Adjustment and Tuning Thereof.
First use Dec. 7, 1954.

SN 4,495. Trulite Corporation, Los Angeles, Calif. Filed Mar. 13, 1956.

## TRULITE

For Automobile Headlight Aligning Units.
First use May 9, 1955.

SN 6,564. Taylor, Taylor & Hobson Limited, Leicester, England. Filed Apr. 17, 1956.

## TELE-PANCHRO

Owner of British Reg. No. 744,263, dated July 11, 1955.
For Lenses.

SN 6,565. Taylor, Taylor & Hobson Limited, Leicester, England. Filed Apr. 17, 1956.

**SPEED PANCHRO**

Owner of British Reg. No. 638,696, dated July 17, 1945.
For Photographic Lenses.

SN 6,687. The Brearley Company, Rockford, Ill. Filed Apr. 19, 1956.

**REGENT**

For Weighing Scales.
First use Oct. 28, 1955.

SN 6,781. American Speedlight Corporation, Middle Village, N. Y. Filed Apr. 20, 1956.

**ascorlight**

For Electronic Flash Apparatus in Which a Capacitor Is Charged and Thereafter Discharged Through a Gas-Filled Tube To Produce a Flash of Light.
First use Apr. 15, 1955.

SN 7,391. Summit-Roberts Products, Inc., Toledo, Ohio. Filed Apr. 30, 1956.

**CONTOUR-O-SCOPE**

For Instruments for Measuring the Dimensional Accuracy of Three-Dimensional Parts and Products.
First use Apr. 20, 1956.

SN 7,512. Kono Manufacturing Co. Inc., Woodside, N. Y. Filed May 2, 1956.

KONO K

Owner of Reg. Nos. 399,899 and 410,920.
For Eyeglass and Spectacle Frames and Parts Therefor, Including Nosepieces, Temples, and the Like.
First use April 1946.

SN 7,514. Kono Manufacturing Co. Inc., Woodside, N. Y. Filed May 2, 1956.

**KONO**

Owner of Reg. Nos. 399,899 and 410,920.
For Eyeglass and Spectacle Frames and Parts Therefor, Including Nosepieces, Temples, and the Like.
First use April 1946.

## CLASS 27

## HOROLOGICAL INSTRUMENTS

SN 689,499. The Lux Clock Manufacturing Company, Waterbury, Conn. Filed June 14, 1955.

**VENUS**

For Clocks—Namely, Boudoir, Desk, Mantle, and Alarm Clocks.
First use May 13, 1955.

## CLASS 28

## JEWELRY AND PRECIOUS-METAL WARE

SN 5,997. Glamour Jewelry Inc., Providence, R. I. Filed Apr. 9, 1956.

**SNAP-IT**

For Earrings.
First use Apr. 3, 1956.

SN 10,692. The Kinney Company, Providence, R. I. Filed June 21, 1956.

K

For Jewelry—Namely, Rings, Pins, Bracelets, Lockets, Chains, Buckles, Tie Clips, Cuff Links, Money Clips, Medals, and Badges, Made of Precious and Semi-Precious Metals.
First use January 1906.

## CLASS 30

## CROCKERY, EARTHENWARE, AND PORCELAIN

SN 10,868. Gladding, McBean & Co., Los Angeles, Calif. Filed June 25, 1956.

**ENCORE**

For Dinnerware of Fine China.
First use June 13, 1956.

## CLASS 31

## FILTERS AND REFRIGERATORS

SN 2,757. Cold Corporation of America, Chicago, Ill. Filed Feb. 16, 1956.

**CHIP-FREEZE**

For Commercial Ice Making Machines.
First use Nov. 4, 1954.

SN 4,806. Koch Refrigerators, Inc., Kansas City, Kans. Filed Mar. 19, 1956.

SELL-O-VISION Styling

Owner of Reg. No. 236,997.
For Refrigerated Display Cases, Cooling Safes, and Refrigerators for the Preservation of Foodstuffs.
First use Jan. 30, 1956.

SN 6,347. The National Filter Media Corporation, New Haven, Conn. Filed Apr. 13, 1956.

**POLYMAX**

For Filter Media.
First use Oct. 14, 1955.

SN 6,419. Freezette Sales Corporation, Detroit, Mich. Filed Apr. 16, 1956.

*Freez-ette*

For Refrigerators.
First use on or about Dec. 16, 1954.

## CLASS 32

## FURNITURE AND UPHOLSTERY

SN 3,938. Hagerty Company, Cohasset, Mass. Filed Mar. 6, 1956. Sec. 2(f) as to "Hagerty."

**HAGERTY MODERN**

No claim is made to the word "Modern" apart from the mark as a whole.
For Furniture—Namely, Chairs, Tables, Wall Shelves, and Book Cases, Chair Kits, Table Kits, Wall Shelf Kits, and Book Case Kits, Including Prefabricated Parts for Chairs, Tables, Wall Shelves, and Book Cases; Each of Said Kits Including Glue and/or Cement for Setting Up Said Kits.
First use Jan. 3, 1956; and October 1949 as to "Hagerty."

SN 7,062. The Basic-Witz Furniture Industries, Incorporated, Waynesboro, Va. Filed Apr. 25, 1956.

For Furniture, Case Goods—Namely, Dining Room and Bed Room Furniture.
First use Jan. 4, 1956.

SN 12,173. Louis Elliott Frey, Los Angeles, Calif. Filed July 16, 1956.

**BLANKETUCK**

For Beds, Bed Springs, and Bed Frames.
First use Jan. 10, 1956.

## CLASS 33

## GLASSWARE

SN 10,305. Ekco Products Company, Chicago, Ill. Filed June 15, 1956.

**EKCO**

For Glassware Including Beverage Making and Serving Pitchers, Drinking Vessels, and Mixing Bowls for Beater and Bowl Sets.
First use Nov. 1, 1944.

## CLASS 34

## HEATING, LIGHTING, AND VENTILATING APPARATUS

SN 721. Agricultural Equipment Corp., La Junta, Colo. Filed Jan. 16, 1956.

*Agri-Quip*

For Weed Burning Apparatus for Mounting on Tractors, Railway Cars, Etc., for Agricultural and Industrial Use.
First use on or about Dec. 1, 1952.

SN 7,406. Western Engineering and Manufacturing Co., Venice, Calif. Filed Apr. 30, 1956.

For Commercial and Industrial Ventilators.
First use Nov. 1, 1955.

SN 9,824. Surface Combustion Corporation, Toledo, Ohio. Filed June 7, 1956.

**JANITROL**

Owner of Reg. Nos. 278,558, 546,700, and others.
For Conversion Burners.
First use Apr. 5, 1930.

SN 10,276. Ald, Inc., Chicago, Ill. Filed June 15, 1956. Owner of Reg. No. 539,267.

**ALDHEET**

For Water Heaters.
First use Apr. 21, 1948.

## CLASS 35

## BELTING, HOSE, MACHINERY PACKING, AND NONMETALLIC TIRES

SN 8,557. Jordan-Rogers Company, Orange, Calif. Filed May 18, 1956.

JR

For Hose, and Particularly for Plastic Garden Hose.
First Use Feb. 8, 1955.

SN 9,375. The McCandless Corporation, New York, N. Y. Filed May 31, 1956.

The drawing is lined for red.
For Retread Material of Natural or Synthetic Rubber or Blends Thereof for Use in Retreading Automobile or Other Automotive Vehicle Tires, and Sometimes Known as "Camel-Back."
First use during 1936.

CLASS 37

PAPER AND STATIONERY

SN 680,521. C P S Manufacturing Company, Chicago, Ill. Filed Jan. 26, 1955.

CPS ROCKET SEAL

For Wrappers for Frozen Confections.
First use Oct. 28, 1954.

SN 684,986. Vereinigte Papierwerke Schickedans & Co., Nurnberg, Germany. Filed Apr. 5, 1955.

Owner of German Reg. No. 657,339, dated May 10, 1954.
For Cellulose Wiping Sheets and Tissues, Cellulose Handkerchiefs, Cellulose Napkins, and Cellulose Mats.

SN 695,479. Wilson Jones Company, Chicago, Ill. Filed Sept. 28, 1955.

ANCHOR

For Correspondence Envelopes.
First use Oct. 1, 1932.

SN 695,702. A. T. Cross Pencil Company, Providence, R. I. Filed Oct. 3, 1955.

CROSS

Owner of Reg. No. 526,855.
For Mechanical Pencils and Fountain Pens.
First use 1868.

SN 697,316. Wolf Brothers, Inc., Philadelphia, Pa. Filed Nov. 1, 1955.

SHADOW WEB

For Paper Bags.
First use Mar. 7, 1955.

SN 699,330. Lowe Paper Company, Ridgefield, N. J. Filed Dec. 2, 1955.

Owner of Reg. No. 313,200.
For Coated Boxboard, Tag Stock, Kraft Paper, Both Bleached and Natural Kraft, Wrapping Cellophane and Wrapping Laminated Foil.
First use Nov. 26, 1954.

SN 2,632. Erick A. Hahn, d. b. a. E. & H. Sales Company, Chicago, Ill. Filed Feb. 14, 1956.

STEPONS

For Sanitary Bath and Shower Mat Formed of Paper.

# PATENTS

## NOTICES

### Adjudicated Patents

(D. C. Ga.) Lawson and Green Patent No. 2,217,022 (66—43), for solid color pattern knitting machine. Claims 2, 3, 48, 50, and 52 *Held* valid and infringed. *Hemphill Co. v. Holeproof Hosiery Co.*, 143 F. Supp. 727; 109 USPQ 478.

(D. C. Calif.) Wilson Patent No. 2,464,361 (67—22), for drip candle, *Held* valid and infringed. *Wilson v. Muench-Kreuser Candle Co., Inc.*, 143 F. Supp. 648; 109 USPQ 470.

### Disclaimer

2,758,733.—*Carl H. Melle*, Fort Wayne, Ind. VALVE TAPPET ASSEMBLY. Patent dated July 31, 1956. Disclaimer filed Oct. 26, 1956, by the assignee, *International Harvester Company*.

Hereby enters this disclaimer to claims 1 to 10 inclusive of said patent.

### Patents Available for Licensing or Sale

2,596,188. Adjustable Stroke Dispensing Pump. Ernest Dale Minton, 1013 Mission, Apt. 8, South Pasadena, Calif.

2,758,643. Draw Curtain Type Awning. Harvey L. Angus, 429 6th St., Havre, Mont.

2,761,587. Automatic Timer and Shutoff Device (Control for Lawn Sprinkler and Similar Devices). Irving Schantz, 1007 Midway Ave., Lancaster, Pa.

2,761,719. Padlock Hasp and Knocker. Dr. Alberto Avila-Figueroa, San Salvador, El Salvador, Central America.

2,765,105. Fat Saver Vessel for Gravy and the Like. Harold W. Sullivan. Correspondence to: Eaton, Bell, Hunt & Seltzer, 904 Johnston Bldg., Charlotte 2, N. C.

2,765,860. Selective Wheeled or Endless Belt Supports for Self-Propelled Vehicles (Mobile Wheel Chair for Paraplegics). Robert E. Church, R. E. Church Enterprises, Elkin, N. C. Correspondence to: Eaton, Bell, Hunt & Seltzer, 904 Johnston Bldg., Charlotte 2, N. C.

General Electric Company is prepared to grant nonexclusive licenses under the following 27 patents on reasonable terms to domestic manufacturers.

Applications for license under the following 5 patents may be addressed to: General Electric Company, Transformer Division, 100 Woodlawn Ave., Pittsfield, Mass. Attention: Patent Counsel.

2,248,608. Protective Device.

2,280,625. Transformer.

2,290,671. Insulated Conducting Member and Method of Applying the Insulation.

2,316,558. Transformer.

2,452,901. Electromagnetic Induction Apparatus.

Applications for license under the following 2 patents may be addressed to: General Electric Company, Component Products Division, 1635 Broadway, Fort Wayne, Ind.

2,756,013. Resilient Mounting.

2,758,228. Cast Rotor Structure.

Applications for license under the following 2 patents may be addressed to: General Electric Company, Aircraft Gas Turbine Division, Cincinnati 15, Ohio, Attention: Patent Counsel.

2,746,244. Reaction Power Plant Variable Discharge Area Nozzle Control System.

2,764,390. Anti-Icing Device.

Applications for license under the following 18 patents may be addressed to: General Electric Company, Appliance & Television Receiver Division, Appliance Park, Louisville 1, Ky.

2,707,085. Vibration Damping System for Automatic Washers and the Like.

2,737,573. Lighting Means for Automatic Clothes Washers.

2,738,072. Time Controlled Cover Lock for Clothes Washers and the Like.

2,742,128. Hydraulic Clutch Actuation Means for Washing Machines and the Like.

2,743,587. Control for Refrigerating Apparatus.

2,745,169. Method for Supporting a Cylinder Assembly on a Compressor Frame.

2,745,256. Evaporator of High Thermal Mass.

2,745,707. Dishwasher Rack and Supporting Frame.

2,745,937. Electric Oven Heating System.

2,746,270. Defrosting Arrangements for Refrigerating Systems.

2,746,262. Centrifugal Drainage Pump.

2,746,590. Rotating Receptacle Structure for Household Refrigerators.

2,750,782. Laundry Apparatus.

2,751,197. Refrigerator Humidifier.

2,755,157. Sliding Shelf.

2,758,446. Two Control Two-Temperature Refrigerating System.

2,758,450. Refrigerator Cabinet.

2,761,626. Auxiliary Waste Receiver for Waste Disposal Apparatus.

### Patents Removed From Register

The following patent is hereby withdrawn from the Register of Patents Available for Licensing or Sale. It was listed by General Electric Company in the Notices section of the OFFICIAL GAZETTE of June 16, 1953.

2,612,635. Induction Voltage Regulator.

### New Applications Received During September 1956

| | |
|---|---|
| Patents | 5,343 |
| Designs | 336 |
| Plants | 11 |
| Reissues | 10 |
| Total | 5,700 |

### Issues

| | | | |
|---|---|---|---|
| Patents | 807 | No. 2,771,608 to No. | 2,772,414, incl. |
| Designs | 60 | No. 179,276 to No. | 179,335, incl. |
| Plants | 2 | No. 1,530 to No. | 1,531, incl. |
| Reissues | 2 | No. 24,240 to No. | 24,241, incl. |
| Total | 871 | | |

| DIVISIONS, EXAMINERS AND SUBJECTS OF INVENTION (Roman numerals in parentheses indicate Examining Group) | Oldest Application | |
|---|---|---|
| | New | Amended |
| 31. (I) HUTCHISON, E. W., Carbon Chemistry (part), e. g. Urea Adducts, Silicon Containing Carbon Compounds, Hydrogenation of Carbon Oxides, Partial Oxidation of Non-Aromatic Hydrocarbon Mixtures, Hydrocarbons, Halogenated Hydrocarbons | 9-9-55 | 8-17-55 |
| 32. (VII) BERMAN, H., Gas and Liquid Contact Apparatus; Heat Exchange; Gas Separation; Agitation; Self Proportioning Fluid Systems; Liquid Level Responsive Systems; Fire Extinguishers | 1-6-56 | 6-12-55 |

| 34. (IV) SAPERSTEIN, S., Railways—Draft Appliances, Switches and Signals, Surface Track, Rolling Stock, Track Sanders; Electricity, Transmission to Vehicles; Dumping Vehicles; Vehicle Fenders; Hand and Hoist Line Implements | 11-23-55 | 9-13-54 |
| 35. (IV) BROMLEY, E. D., Dispensing; Finant Material Handling, Filling; Toilet, Kitchen and Table Articles | 1-18-56 | 8-16-55 |
| 36. (V) McFADYEN, A. D., Measuring and Testing | 9-26-55 | 9-6-55 |
| 37. (II) LEVY, M. L., Electricity—Switches, Welding, Heating | 10-14-55 | 3-11-55 |
| 38. (I) MARMELSTEIN, N., Carbon Chemistry (part), e. g., Azo, Carbocyclic or Acyclic Compounds (part), e. g. Anthrones, Triarylmethanes, Esters, Acids, Ketones, Aldehydes, Ethers, Phenols, Alcohols | 1-5-56 | 6-6-55 |
| 39. (IV) WEIL, I., Fluid-Pressure Regulators; Valves; Fluid Handling (except Pressure Modulating Relays, Self-Proportioning Systems, Float Valves, Diaphragms and Bellows) | 1-3-56 | 10-1-54 |
| 40. (V) DRUMMOND, E. J., Receptacles—Metallic, Paper, Wooden, Glass; Special Receptacles and Packages | 1-3-56 | 8-1-55 |
| 41. (V) GURLEY, R. B., Coin Controlled Apparatus; Dispensing Cabinets; Coin Handling; Mail, Fare or Other Collection Boxes or Chutes; Buckles, Buttons and Clasps; Racks; Fire Escapes; Ladders; Scaffolds | 7-20-55 | 9-3-54 |
| 42. (II) MARANS, H., Electric Signaling; Signals and Indicators; Telegraphy; Electrical Connectors | 4-29-55 | 10-19-54 |
| 43. (I) ARNOLD, D., Medicines, Poisons, Cosmetics; Sugar and Starch; Skins, and Leathers; Preserving, Sterilizing and Disinfecting (except Weed Treatment Apparatus) | 9-26-55 | 1-28-55 |
| 44. (II) EVANS, N. H., Antennas; Automatic Pilots; Directive Radio Systems; Mass Spectrometers; Nuclear Batteries; Nuclear Resonant Devices; Neutron Detecting and Measuring; Radar ;Sonar; Torpedoes | 6-2-55 | 6-19-54 |
| 45. (VI) MANIAN, J. A., Wheels, Tires and Axles; Railway Wheels and Axles; Lubrication; Bearings and Guides; Belt and Sprocket Gearing; Spring Devices; Animal Draft Appliances | 10-26-55 | 2-9-55 |
| 46. (I) WILES, W. G., Actinide Series (e. g., Sniomable) Compounds; Sintered Metal Stock; Explosives; Power Plants (part); Metallurgy (part); Surgery (part); Radioactive Medicines; Irradiation Chemistry; Carbon Chemistry (part) | 7-26-55 | 1-10-55 |
| 47. (VI) KANOF, W. J., Mining, Quarrying, and Ice Harvesting; Motor Vehicles; Land Vehicles | 1-10-56 | 7-20-55 |
| 48. (II) BERNSTEIN, S., Electricity—Conversion Systems, Protective Systems; Measuring and Testing (except Meters); Spark Plugs and Ignition Systems, Switchboards, Relays, Magnets, Inductors, Transformers, Condensers, Transistors, Barrier Layer Rectifiers | 8-12-55 | 8-18-54 |
| 49. (VII) BENDETT, B., Drying and Gas or Vapor Contact with Solids; Ventilation; Wells; Earth Boring | 9-1-55 | 9-21-55 |
| 50. (I) BENGEL, W. G., Carbon Chemistry (part), e. g. Synthetic Resin Compositions, Synthetic Rubber Compositions, Natural Rubber | 12-30-55 | 9-7-54 |
| 51. (II) YAFFEE, S., Radio Transmitters, Receivers and Tuners; Modulators; Piezoelectric Devices; Music | 12-29-55 | 8-24-54 |
| 52. (V) NEFF, P. R., Supports Joint Packing; Valved Pipe Joints or Couplings; Rod Joints or Couplings; Tool Handle Fastenings; Pipes and Tubular Conduits; Shaft Packing | 10-24-55 | 11-15-54 |
| 53. (IV) REYNOLDS, E. R., (NINAS, G. A., acting), Label Pasting and Paper Hanging; Books and Book Making; Manifolding; Printed Matter; Stationery; Paper Files and Binders; Flexible or Portable Closures or Partitions; Doors, Windows, Awnings and Shutters; Harness; Whip Appiratus | 12-2-55 | 3-30-55 |
| 54. (II) NILSON, R. G., Electric Lamps; Electronic Tubes; Miscellaneous Discharge Devices; Lamp, Cathode Ray and Gas Discharge Device Circuits; Ray Energy (e. g. X-Ray, Ultraviolet, Radioactive) Applications | 10-24-55 | 10-4-54 |
| 55. (VII) KLINE, J. R., Surgery; Dentistry; Artificial Body Members; Separating and Sorting Solids; Centrifugal Bowl Separators; Comminutors | 7-26-55 | 11-15-54 |
| 56. (I) SPECK, J. R., Abrading Compositions; Batteries; Coating or Plastic Compositions; Electrical and Wave Energy Chemistry | 12-22-55 | 9-13-55 |
| 57. (III) MILLER, A. B., Bolt, Nut, Rivet, Nail, Screw, Chain and Horseshoe Making; Driven and Screw Fastenings; Nut and Bolt Locks; Jewelry; Pipe Joints or Couplings | 3-19-56 | 2-2-55 |
| 58. (III) BRONAUGH, F. H., Rolls and Rollers; Making Metal Tools and Implements; Stone Working; Abrading Processes and Apparatus; Food Apparatus; Closure Operators; Baths, Closets, Sinks and Spittoons | 10-17-55 | 11-4-54 |
| 59. (I) HENKIN, B., Inorganic Chemistry; Fertilizers; Gas, Heating and Illuminating | 9-20-55 | 1-24-55 |
| 60. (I) MANGAN, P. E., Carbon Chemistry (part), e. g., Synthetic Resins, Synthetic Rubber; Photographic Processes and Products | 8-2-55 | 9-30-54 |
| 61. (III) MORSE (Miss), E. L., Winding and Reeling; Pushing and Pulling; Horology; Time Controlling Apparatus; Railway Mail Delivery | 12-6-55 | 3-4-55 |
| 62. (IV) SHAPIRO, A., Games; Toys; Amusements and Exercising Devices; Mechanical Guns and Projectors; Illumination | 1-9-56 | 7-5-55 |
| 63. (I) WINKELSTEIN, A. H., Foods and Beverages; Carbon Chemistry (part), e. g., Lignins, Carbonhydrate Derivatives; Fats and Metal Containing Carbocyclic or Acyclic Carbon Compounds | 11-28-55 | 12-15-54 |
| 64. (I) GREENWALD, J., Fuels; Miscellaneous Compositions | 12-27-55 | 12-20-54 |
| 65. (V) LISANN, L., Geometric Instruments; Automatic Weighing Scales; Acoustics | 10-27-55 | 6-21-54 |
| 67. (VII) KRAFFT, C. F., Laminated Fabrics; Ornamentation; Bleaching, Dyeing, Fluid Treatment of Textiles | 9-6-55 | 2-19-55 |
| 68. (II) GALVIN, D. J., Wave Guides; Electric Motors; Sound Recording; Conductors; Insulators | 11-17-55 | 9-15-54 |
| 70. (II) BREWBINK, J. L., Security laws administration. | | |
| CLASS. DIVS. I BAILEY, J. S., Paper Making; Mineral Oils | 9-14-55 | 4-8-55 |
| CLASS. DIVS. II LADY, J. E., Oscillators; Amplifiers; Resistances and Rheostats | 1-16-56 | 10-14-55 |
| CLASS. DIVS. III WAHL, R. A., Cutting and Punching; Apparel (part), e. g., Corsets and Brassieres | 1-9-56 | 7-5-55 |
| CLASS. DIVS. IV SMITH (Mrs.), M. P., Harrows and Diggers; Plows; Fluid Sprinkling, Spraying and Diffusing | 12-2-55 | 2-14-55 |
| CLASS. DIVS. V ANGLE, C. D., Liquid Separation or Purification; Sewerage | 2-6-56 | 3-1-56 |
| DESIGNS (III) A—MONCURE, J. A. (acting), Industrial Arts | 2-27-56 | 2-27-56 |
| DESIGNS (III) B—GRAY, M. A., Household, Personal and Fine Arts | 2-2-56 | 3-13-56 |

The following divisions have been abolished: 66 and 69

## EXPIRATION OF PATENTS

The patents within the range of numbers indicated below expire during November 1956, except those which may have been extended under the provisions of the Veterans Patent Extension Act (64 Stat. 316 as amended by 66 Stat. 321) and those which may have expired earlier due to shortened terms under the provisions of Public Law 690. A list of Veterans' patents which have been extended appears in the *Annual Index of Patents—1953*.

Patents ..... Numbers 2,178,536 to 2,181,857, inclusive
Plant Patent ..... Numbers 346 to 348, inclusive

## CONDITION OF PATENT APPLICATIONS AS OF SEPTEMBER 28, 1956

| | |
|---|---|
| Total number of pending applications (excluding Designs) | 217,262 |
| Total number of pending Design applications | 6,321 |
| Total number of applications awaiting action (excluding Designs) | 120,204 |
| Total number of Design applications awaiting action | 2,772 |
| Date of oldest new application | Apr. 29, 1955 |
| Date of oldest amended application | May 18, 1954 |

ROSA, M. C., Director, Patent Examining Operation

| PATENT EXAMINING GROUPS, AND SUPERVISORY EXAMINERS | DIVISIONS |
|---|---|
| I. STONE, I. G., CHEMICAL AND RELATED ARTS | 5, 21, 26, 42, 46, 48, 49, 52, 53, 54, 63, 64. |
| II. STRACHAN, O. W., COMMUNICATIONS, RADIANT ENERGY AND ELECTRICAL ARTS | 16, 23, 25, 37, 42, 44, 45, 51, 54, 68, 70. |
| III. YUNG KWAI, S., MECHANICAL MANUFACTURING, MACHINE ELEMENTS AND DESIGNS | 3, 13, 15, 16, 22, 24, 27, 33, 61, Designs. |
| IV. FREEHOF, H. B., MATERIAL HANDLING AND TREATING, OPTICS, RAILWAYS AND AMUSEMENT DEVICES. | 7, 11, 17, 27, 34, 35, 39, 53, 62. |
| V. HULL, J. S., STATIC STRUCTURES AND INSTRUMENTS OF PRECISION | 2, 20, 30, 33, 35, 40, 41, 52, 65. |
| VI. MURPHY, T. F., AGRICULTURE, TRANSPORTATION, PUMPS AND MOTORS | 1, 4, 5, 9, 10, 14, 32, 33, 45, 47. |
| VII. KAUFFMAN, H. E., HEATING AND COOLING, PLASTIC SHAPING AND COATING, SEPARATION AND MIXING, BODY TREATMENT AND CARE. | 3, 15, 19, 28, 32, 43, 55, 67. |
| CL. GORECKI, G. A., ARTS UNDERGOING RECLASSIFICATION AS LISTED UNDER CLASSIFICATION DIVISIONS. | I, II, III, IV, V. |

| DIVISIONS, EXAMINERS AND SUBJECTS OF INVENTION (Roman numerals in parentheses indicate Examining Group) | Oldest Application | |
|---|---|---|
| | New | Amended |
| 1. (VI) GOLDBERG, A. J., Brakes; Excavating; Planting; Plant Husbandry; Scattering Unloaders | 10-21-55 | 11-9-54 |
| 2. (III) HERRMANN, D., Fishing, Trapping and Vermin Destroying; Presses; Tobacco; Textile Wringers | 12-29-55 | 6-7-55 |
| 3. (VII) LE ROY, C. A., Metal Founding and Treatment; Metallurgy (Process and Apparatus); Alloys | 1-20-56 | 11-6-54 |
| 4. (VI) FALLER, E. A., Hoists; Power Driven Conveyors; Handling Apparatus; Elevators; Feeding of Indefinite Lengths | 12-29-55 | 1-25-55 |
| 5. (VI) ROBINSON, C. W., Harvesters; Potato Diggers; Stalk Pullers and Choppers; Stone Gatherers; Threshing; Knotters; Animal Husbandry; Bee Culture; Dairy; Butchering; Vegetable and Meat Cutters and Comminutors; Fences; Gates | 12-12-55 | 5-3-55 |
| 6. (I) SURLE, H., Carbon Chemistry (part), e. g. Natural Resins, Proteins, Heterocyclic Amides, Amines, General Organic Processes | 7-1-55 | 3-10-55 |
| 7. (IV) GONSALVES, J. E., Optics, Photographic Apparatus | 12-9-55 | 1-3-55 |
| 8. (V) LEWIS, R. O., Beds; Chairs and Seats; Cabinets; Tables; Miscellaneous Furniture | 7-14-55 | 9-30-54 |
| 9. (VI) BRANSON, J. H., Pumps; Fans; Turbines | 12-29-55 | 10-14-54 |
| 10. (VI) BOYD, S., Firearms; Ordnance; Ammunition; Explosive Charge Making | 9-21-55 | 1-17-55 |
| 11. (IV) BENHAM, E. V., Boots, Shoes and Leggings; Shoe and Leather Manufacture; Button, Eyelet and Rivet Setting; Nailing, Stapling and Clip Clenching; Card, Picture and Sign Exhibiting; Cultery; Cleaning and Liquid Treatment of Solids | 2-3-56 | 4-6-55 |
| 12. (III) SPINTMAN, S., Machine Elements; Engine Starters; Interrelated Clutch and Motor Controls | 10-10-55 | 7-13-54 |
| 13. (III) BEALL, T. E., Gear Cutting; Electric Lamp and Tube Manufacture; Needle and Pin Making; Metal Working (part), e. g. Special Work, Forging, Plastic Working, Drawing, Sawing, Milling, Planing, Turning | 12-6-55 | 10-4-54 |
| 14. (III) MANIAN, J. C., Metal Working (part), e. g. Sheet Metal, Wire Bending, Miscellaneous Processes, Assembly and Disassembly Apparatus; Wire Fabrics; Air Brakes | 9-30-55 | 9-17-54 |
| 15. (VII) BRINDISI, M. V., Plastics; Plastic Block and Earthenware Apparatus; Glass | 1-3-56 | 9-28-54 |
| 16. (II) LOVEWELL, N. N., Television; Telephony; Recorders | 9-26-55 | 7-20-54 |
| 17. (IV) LEIGHEY, R. A. (HOFFMAN, R. J., acting), Paper Manufactures; Packaging; Typewriters; Printing; Type Casting and Setting; Sheet Material Association or Folding; Sheet or Web Feeding | 11-14-55 | 1-7-55 |
| 18. (VI) BLUM, A., Power Plants; Fluid Transmissions; Servomotor Systems; Jet Motors; Combustion Turbines; Speed Responsive Devices | 11-16-55 | 11-20-54 |
| 19. (VII) PATRICK, P. L., Stoves and Furnaces; Boilers; Concentrating Evaporators; Fluid Fuel Burners | 12-14-55 | 4-25-55 |
| 20. (V) BROWN, L. M., Miscellaneous Hardware; Closure Fasteners; Locks; Safes; Bank Protection; Bread, Pastry and Confection Making; Tents and Canopies; Umbrellas; Canes; Undertaking | 1-10-56 | 1-3-55 |
| 21. (III) MADER, E. C., Textiles | 12-5-55 | 1-12-55 |
| 22. (VI) MARLAND, M. L., Aeronautics; Boats; Buoys; Ships; Marine Propulsion; Propellers; Windmills; Fluid Diaphragms and Bellows; Boring and Drilling | 11-28-55 | 11-9-54 |
| 23. (II) ANDRUS, L. M., Cash and Fare Registers; Calculators and Counters; Education | 8-8-55 | 6-18-54 |
| 24. (III) DRACOPOULOS, P. T. (HICKEY, T. J., acting), Apparel (except Corsets and Brassieres); Apparel Apparatus; Sewing Machines; Textiles, Ironing or Smoothing; Clutches and Power-Stop Control | 1-9-56 | 10-14-54 |
| 26. (VII) NEVIUS, R. D., Coating—Processes, Miscellaneous Products and Apparatus; Distillation; Wood Treating Apparatus | 10-27-55 | 1-3-55 |
| 28. (II) YOUNG, R. R., Electricity—Generation, Motive Power, Transmission Systems, Voltage and Phase Control Systems, Furnaces, Battery Charging and Discharging, Arc Lamps, Prime Mover Dynamo Plants; Elevators (part), e. g. Miscellaneous Electric Control Mechanism | 1-31-56 | 7-26-55 |
| 27. (IV) JAMES, S., Brushing, Scrubbing and General Cleaning; Brush, Broom and Mop Making | 1-9-56 | 3-11-55 |
| 29. (VI) BRAUNER, R. H., Internal Combustion Engines; Expansible Chamber Motors; Fluid Servomotors; Spring, Weight and Animal Powered Motors; Cylinders; Pistons; Drive Shafts; Flexible-Shaft Couplings; Chucks or Sockets; Chute, Skid, Guide and Way Conveyors; Fluid Current Conveyors; Pressure Modulating Relays; Pneumatic Dispatch; Store Service; Wheel Substitutes | 10-10-55 | 1-10-55 |
| 30. (V) HABECKER, L. B., Tools; Woodworking; Button, Barrel and Wheel Making; Rubber Tire Removing Tools; Washing Machines; Baggage; Cloth, Leather and Rubber Receptacles; Package and Article Carriers | 11-29-55 | 2-21-55 |
| 31. (VII) O'LEARY, R. A., Refrigeration; Heating Systems; Automatic Temperature and Humidity Regulation, Thermostats, Humidistats; Illuminating Burners; Miscellaneous Heating | 4-2-56 | 5-9-55 |

# PATENT SUITS

Notices under 35 U. S. C. 290; Patent Act of 1952

2,512,612, R. M. Bowie, Cathode ray tube, filed July 20, 1956, D. C., S. D. N. Y., Dec. 111/249, *Sylvania Electric Products, Inc.* v. *Tele-Ray Tube Co. Inc.* Stipulation and order of dismissal Oct. 22, 1956.

2,616,266, M. Davidow, Jacket construction, filed Mar. 22, 1955, D. C., S. D. N. Y., Dec. 22/242, *Davidow, Inc. Sportswear et al.* v. *Klein & Klein Sportswear, Inc.* Stipulation and order of discontinuance Oct. 19, 1956.

2,585,020, D. C. Golf, Underground insulated pipe system, filed Oct. 30, 1952, D. C., E. D. Va. (Richmond), Dec. 2452, *Zonolite Company and Insulating Concrete Corp.* v. *Richmond Redevelopment and Housing Authority.*

2,589,631, J. F. Morse, Web winding and rewinding machine, filed Oct. 16, 1956, D. C., S. D. Calif. (Los Angeles), Dec. 20594-T, *The Morse Instrument Co. et al.* v. *Gordon Enterprises et al.*

2,572,120, F. H. Magnus, Harmonica; 2,407,213, same, Plastic harmonica; 2,416,451, same, Method of and mold for making integral reed plates and reeds, appeal filed Feb. 2, 1955, C. C. A., 2nd Cir., Doc. 23512, *Magnus Harmonica Corp.* v. *Lapin Products, Inc.* Judgment of District Court reversed (notice Aug. 3, 1956). Same, filed Mar. 10, 1948, D. C., S. D. N. Y., Doc. 45/205, *Magnus Harmonica Corp.* v. *Lapin Products, Inc.* Interlocutory decree; patents held valid Sept. 3, 1953: Judgment in accordance with Mandate of U. S. C. A. reversing judgment of District Court Oct. 2, 1956.

2,407,212. (See 2,572,120.)

2,416,451. (See 2,572,120.)

2,536,721, A. H. Rinch, Pulp decoy, filed Oct. 19, 1955, D. C., E. D. Wis. (Milwaukee), Dec. 55/c/287, *Pulp Reproduction Co.* v. *Frankfurth Hardware Co. et al.* Consent judgment Oct. 2, 1956.

2,594,731, F. J. Perillo, Projector stripfilm advancing and framing mechanism, filed Mar. 23, 1955, D. C., S. D. N. Y., Dec. 99/263, *Viewlex, Inc.* v. *Bell & Howell Co.* Stipulation and order of dismissal Oct. 22, 1956.

2,570,282, B. Gindice, Skate clamp, filed Nov. 25, 1953, D. C., S. D. N. Y., Dec. 99/292, *Sure Grip Safety Skate Clamp Corp. et al.* v. *K & K Supply Co., Inc. et al.* Consent decree and judgment for injunction Oct. 16, 1956.

2,599,426, Bennett and Webb, Slide changing device for stereopticon projectors, filed June 3, 1955, D. C., E. D. N. Y. (Brooklyn), Dec. 15602, *Bell & Howell Co.* v. *Viewlex, Inc.* Case dismissed Oct. 22, 1956.

2,607,651, L. K. Jackson, Bedframe and special caster receiving socket construction, filed Oct. 19, 1956, D. C., S. D. N. Y., Dec. 114/74, *Harvard Mfg. Co.* v. *Western Spring Co. et al.*

2,613,103, G. E. Groesmeyer, Thermal insulation, filed Nov. 18, 1955, D. C. N. J. (Trenton), Dec. 1095/56, *Hunter Mfg. Corp.* v. *Mirror Insulation Co., Inc. et al.* Complaint and counterclaim dismissed Oct. 22, 1956.

2,648,616, J. T. Martin, Packaged popcorn kernels and popping oil, filed Oct. 10, 1956, D. C., M. D. Ga. (Thomasville), Doc. 491, *Rose Kist Popcorn Co., Inc.* v. *Winn-Dixie, Inc.*

2,697,491, W. H. Feimstone, Condensation products of trimethylhydroxyethyl ammonium hydroxide and dimethylxanthine and process of preparing same, filed Oct. 18, 1956, D. C., S. D. N. Y., Doc. 114/51, *Nopco Chemical Co., Inc.* v. *Sod Star Chemical Co., Inc.*

2,675,835, J. Pasquale, Method and machine for laminating plastic, filed Oct. 24, 1956, D. C., E. D. N. Y. (Brooklyn), Doc. 17024, *Liberty Machine Co., Inc.* v. *T & M Machine & Tool Corp. et al.*

2,695,615, V. R. Del Guercio, Infant's garment, appeal filed Oct. 22, 1956, C. C. A., 2nd Cir., Doc. 24260, *Modelle Mfg. Co.* v. *Famous Bathrobe Co.*

2,702,960, D. R. Harwin et al., Apparatus and method for producing sponge rubber carpet underlay, included by amended complaint filed Oct. 12, 1956, D. C., S. D. Calif. (Los Angeles), Doc. 20439-T, *National Sponge Cushion Co., Inc.* v. *Rubber Corp. of Calif. et al.*

2,707,422, W. R. Canfield, Curb laying machine, filed Oct. 19, 1956, D. C., W. D. N. C. (Charlotte), Doc. 1196, *E. L. Hardin Association, Inc.* v. *E. D. Etnyre & Co. et al.*

2,742,678, J. R. Olshei, Combined washer and windshield cleaner, filed Oct. 24, 1956, D. C., S. D. Iowa (Des Moines), Doc. 3/731, *Trico Products Corp.* v. *The Delmue Co. et al.*

2,702,926, F. E. Visscher, Scopolamine lower-alkyl halide therapeutic composition, filed Oct. 19, 1956, D. C., S. D. Fla. (Miami), Doc. 7234-M, *The Upjohn Co.* v. *A. S. Merrell Pharmaceuticals.* Same, D. C., N. D. Ill. (Springfield), Doc. 2223, *The Upjohn Co.* v. *Lincoln Laboratories, Inc.*

2,702,960, F. P. Norman, Barring pads with expansible opening for attaching to earring, filed Oct. 22, 1956, D. C., E. D. N. Y. (Brooklyn), Doc. 17918, *Frances P. Norman et al.* v. *Leonard Lawrence.*

Re. 24,126, H. E. Marvel, Water-fuel separator, filed Oct. 22, 1956, D. C., E. D. Va. (Richmond), Doc. 2424, *Separ, Inc.* v. *Richmond Engineering Co., Inc.*

Des. 181,127, C. Kronfeld, Scarf or similar article, filed Feb. 2, 1955, D. C., S. D. N. Y., Doc. 99/285, *F. B. Crumsine Co. Inc. et al.* v. *Cyc Kronfeld.* Patent held invalid Oct. 22, 1956.

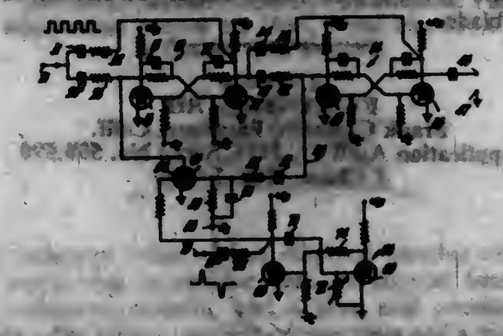
Des. 171,468, E. Rodriguez, Expansible link chain for a bracelet, filed Oct. 20, 1955, D. C., S. D. N. Y., Doc. 104/176, *Jacoby-Bender, Inc.* v. *Micro Fine Bracelet Corp. et al.* Consent order of dismissal without prejudice Oct. 24, 1956.

Des. 174,896, R. Ranchi, Lamp, filed Oct. 17, 1956, D. C., S. D. Calif. (Los Angeles), Doc. 20260-T, *Cafe Candle Lite Mfg. Inc.* v. *Ed Gelford et al.* Same, Doc. 20640-T, *Cafe Candle Lite Mfg. Inc.* v. *Hollywood Bar Supply Co.*

# REISSUES

## NOVEMBER 27, 1956

Matter enclosed in heavy brackets [ ] appears in the original patent but forms no part of this reissue specification; matter printed in italics indicates additions made by reissue.



24,240

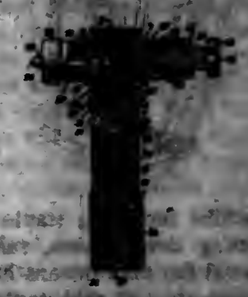
### ELECTRONIC PHASE SHIFTING SYSTEM

Arthur E. Cauhorn, Brooklyn, N. Y., assignor to Radio Corporation of America, a corporation of Delaware

Original No. 2,636,994, dated April 28, 1953, Serial No. 230,691, June 11, 1951. Application for reissue March 24, 1954, Serial No. 418,909

13 Claims. (Cl. 250—27)

1. Phase shifting apparatus comprising means to provide an alternating current input signal of square wave form, a plurality of multivibrators for performing a frequency division on said signal whereby to provide an output signal from said multivibrators, a feedback [link] *path* for feeding reset pulses from one of said multivibrators to another, and means responsive to a retarding signal for interrupting transmission of said reset pulses whereby to retard the phase of said output signal.



24,241

### INJECTION APPARATUS

Edwin A. May, Glen Rock, N. J., assignor to Becton Dickinson and Company, Rutherford, N. J., a corporation of New Jersey

Original No. 2,642,862, dated June 16, 1953, Serial No. 93,771, May 17, 1949. Application for reissue June 11, 1954, Serial No. 436,263

10 Claims. (Cl. 128—173)

1. An injection apparatus including in combination a casing portion to mount a unit containing a body of medicament to be discharged through an orifice at high velocity, said apparatus providing in communication with said casing portion spaces and passages to receive liquid to operatively act against the medicament to expel the same through the orifice, an accumulator comprising a spring, a piston connected to said spring and extending into one of said spaces and a valve for controlling the flow of liquid from such latter space to said casing portion.

# PLANT PATENTS

## GRANTED NOVEMBER 27, 1956

Owing to the fact that almost all of the illustrations of the plant patents are in colors, it is not practicable to print a cut of the drawing.

1,530

### ROSE PLANT

Louis Lens, Wavre-Notre-Dame, Belgium, assignor to Jackson & Perkins Company, Newark, N. Y., a corporation of New York

Application January 5, 1956, Serial No. 557,617

1 Claim. (Cl. 47—61)

A new and distinct variety of rose plant of the hybrid tea class, substantially as herein shown and described, characterized particularly as to novelty by its upright and firm growth, its stiff-petaled flowers, it floriferousness and suitability for both cut flower and out-of-door use, and the distinctive white color of its flowers.

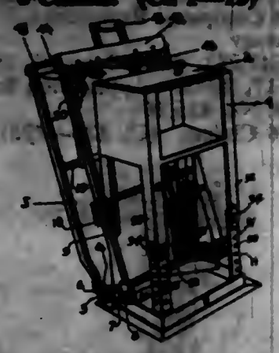
1,531

### ROSE PLANT

Robert V. Lindquist, Hemet, Calif., assignor to Hemet Wholesale, Hemet, Calif., a partnership

Application January 5, 1956, Serial No. 557,618

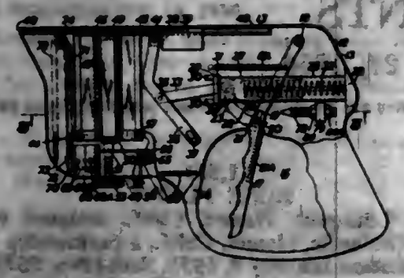
1 Claim. (Cl. 47—61)



A new and distinct variety of rose plant of the climbing hybrid polyantha class, substantially as herein shown and described, characterized particularly as to novelty by being generally similar to its parent variety "Butin" (unpatented), but being essentially distinguished therefrom by its vigorous and climbing habit of growth, and its habit of producing flowers in smaller clusters and on shorter stems than those of said parent variety.

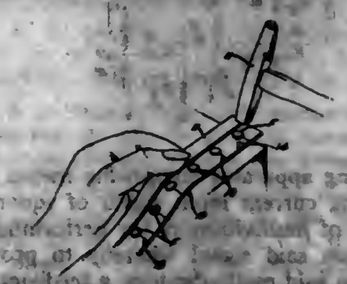
# PATENTS

## GRANTED NOVEMBER 27, 1956



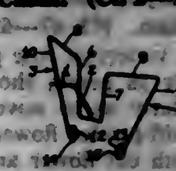
## GENERAL AND MECHANICAL

**2,771,606**
**MULTI-POINT STAPLING MACHINE WITH PLURALITY OF STAPLING UNITS**
Heinrich Mauser, Nuremberg, Germany
Application November 1, 1954, Serial No. 466,180
Claims priority, application Germany November 4, 1953
3 Claims. (Cl. 1—13)



8. A stapling machine including staple driving means and a work supporting anvil means, said anvil means comprising a horizontal flat plate means having a surface extent adapted to cooperate with said staple driving means at a plurality of points in one direction transverse to the plate means, and said staple driving means being mounted for at least selective horizontal movement over said plate means in said one direction whereby stapling can be effected in any position of adjustment of said staple driving means in said one direction.

**2,771,609**
**STAPLING APPLIANCES**
Hans Klopstock, London, England
Application July 25, 1951, Serial No. 238,688
Claims priority, application Great Britain July 28, 1950
2 Claims. (Cl. 1—49)



1. A stapling appliance comprising in combination a casing in the form of a pistol, a butt secured to said casing at the rearward end, a forwardly projecting pointed extension on said casing having a staple ejection opening therein, a staple guideway within said casing and said extension and aligned with said opening, an ejector blade slidably located in said guideway and normally extending substantially to said opening, a staple magazine mounted in said casing and having a staple receiving channel therein for a bank of staples, said channel being normal to said guideway and opening thereto within said casing spring biased means in said channel for normally urging the leading staple of said bank against the ejector blade and for bringing said leading staple into said guideway in front of said blade when said blade is retracted, a manually operable lever pivoted in said casing and projecting from said casing and forming with said butt a manually operable pistol grip, a strong compression spring within the casing at one end against a stationary part in said casing, a plunger on the other end of said spring, a hooked member pivoted to said lever and normally engaging said plunger whereby operation of said lever results in compression of said spring, a link operatively pivotally connected to said blade at one end and pivoted in said casing at the other end, a link pivoted at one end to said first link intermediate the ends and pivoted at the other end to said plunger, and release means for releasing engagement of said hooked member with said plunger when said spring is compressed causing an ejection stroke of said blade.

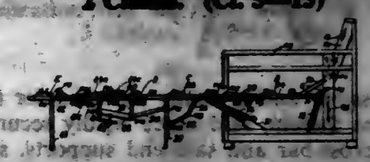
**2,771,610**
**FASTENER STRIP**
Frank G. Smith, Pasadena, Calif.
Application April 11, 1955, Serial No. 500,590
1 Claim. (Cl. 1—86)

A package of fasteners comprising an elongated tape, said tape being reversely folded along one side edge thereof with the reversely folded portion disposed on the upper side of the tape and extending only partially toward the opposite edge of the tape, fasteners having shanks extending through the tape at spaced intervals through that portion of the tape that is not covered by the reversely folded portion, said fasteners having heads disposed against the upper side of the tape and against that portion which is not covered by the reversely folded portion, and the tape being weakened on laterally extending lines extending from each shank to the edge of the tape that has not been reversely folded.

**2,771,611**
**TIE AND COLLAR HOLDER**
Stanley M. Wells, Santa Rosa, Calif.
Application October 25, 1954, Serial No. 464,240
1 Claim. (Cl. 2—132)

An invisible tie and collar holder comprising: an upwardly inclined elongated point designed to enter a tie knot from the rear to a substantial depth and to support the holder from the knot; a shank extending downwardly at an obtuse angle from the lower end of the point so as to lie behind the knot when the holder is attached thereto; two spring arms extending laterally from the shank; said spring arms having only their inner ends connected to the bottom of the shank; each arm having an upwardly extending portion leading from the shank bottom and adapted to be hidden by the knot, and a horizontal portion extending from the top of each of the upwardly extending portions and adapted to lie under a collar; whereby the upwardly extending arm portions will form a U-shaped spring saddle with the shank projecting upwardly from the middle of the saddle and extending forwardly of a plane that lies in the upwardly extending arm portions; the obtuse angle between the shank and the point, causing the point to extend upwardly at a slight angle and almost perpendicular to the said plane, and to resiliently support the tie knot; said arms having a downwardly and forwardly inclined portion extending from the outer ends of the horizontal portions and adapted to lie in back of the collar front edge and terminating in collar-engaging pins for maintaining the holder in the collar.

**2,771,612**
**CUSHIONED TOILET SEAT**
Stanley J. Samuels, Philadelphia, Pa., assignor of fifty percent to Samuel Samuels, Philadelphia, Pa.
Application August 12, 1955, Serial No. 528,079
1 Claim. (Cl. 4—237)

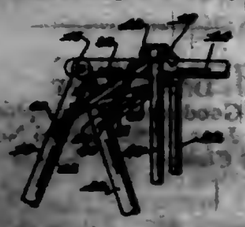


A cushioned toilet seat of elliptical annular construction comprising an annular base, an annular foam rubber cushioning element, and a skin, said annular base having a flat bottom, arcuate convex sides and a truncated top, said cushioning element being plano-convex in cross-section and being securely cemented at its plano portion to the truncated top of said base whereby the edges of the cushioning element freely overhang the arcuate convex sides, said skin being drawn taut about the convex portion of said cushioning element and the bottom of said base and heat sealed at the corners of said base.

**2,771,613**
**FLOOR PROTECTING MAT**
Anna V. Markiewicz, St. Louis, Mo.
Application June 2, 1954, Serial No. 434,985
1 Claim. (Cl. 4—252)

A floor mat for use in connection with a toilet bowl, comprising a fabric backing having a central opening adapted to receive and fit closely with a toilet bowl adjacent the floor and above any flange at the base of the bowl, the sides of said opening converging toward the rear of the mat, the backing having a sector-shaped opening from the rear of the central opening to the periphery of the mat at its rear, the sides of said sector-shaped opening being divergent from an apex at the rear of the central opening to the rear of the mat when the mat is completely flat, a border of elastic material extending completely and continuously around the inner edge of the backing on the underside of the backing and bounding the central opening from the edge of the backing on one side of the inner end of the sector-shaped opening to the edge of the backing on the other side of the inner end of the sector-shaped opening for drawing the inner edge of the backing snugly into engagement with various toilet bowl shapes, slide fastener means secured to the backing on the underside of the mat at opposite sides of the sector-shaped opening for securing together said sides, and a pile facing on the backing.

**2,771,614**
**DAVENPORT**
Robert Goodman, Philadelphia, Pa.
Application June 1, 1953, Serial No. 358,795
2 Claims. (Cl. 5—13)

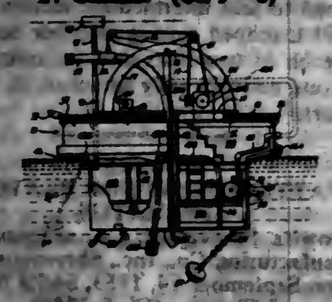


1. A foldable bed frame for a sofa bed comprising head, body, intermediate, and foot sections pivotally connected in end to end relationship and adapted to be forwardly unfolded to a bed position wherein the sections are arranged in substantial coplanar relationship with the head and foot sections at the ends of the bed, the body section adjacent the head and the intermediate section adjacent the foot section and being adapted to be rearwardly folded to a seat position wherein the foot section forms a seat cushion support and is parallel to and spaced above said body section with said head section extending upwardly and at right angles to said body section, a substantially L-shaped leg pivoted intermediate its ends to the free end of said foot section, said foot section including a short arm which extends above and rearwardly along said bed frame when in bed position, means to operate said short arm, a locking member link having one end pivoted to said foot section and having a laterally extending bolt fixed to the free end of said locking member link, a locking member actuating link having one end pivoted intermediate the ends of said locking member link and the other end pivoted to said intermediate section, a first link having an end pivotally joined to said intermediate section and its other end pivotally joined to said leg above its pivot which is connected to the foot section, said intermediate section having a slot adjacent one end, a pusher bar having one end connected to said intermediate section and one end slidable in said slot, a right angle keeper pivotally attached to said end of said pusher bar slidable in said slot, a second link having one end pivotally connected to said head section and the other end pivotally connected to said keeper whereby relative pivotal movement of said head and body sections will rock said keeper, said bolt being adapted to be hooked by said keeper when all of said sections are folded into sofa position in order to keep said foot section from accidentally moving upwardly when it forms the seat section of the sofa, said bolt being adapted to rest directly upon said body section to serve as a brace in order to prevent said foot section from moving downwardly against said body section when the sofa is formed, an L-shaped closing member pivotally mounted intermediate its end to said intermediate section, and the lower end of said L-shaped closing member being pivoted to one end of each of two links and the other end of each link having one end pivotally attached to said frame of said davenport.

**2,771,615**
**BRACE ATTACHMENT FOR PLAYGROUND APPARATUS**
Isadore Herowitz, Shreveport, La., assignor to Universal Manufacturing Co., Inc., Shreveport, La.
Application September 14, 1953, Serial No. 380,044
5 Claims. (Cl. 5—190)

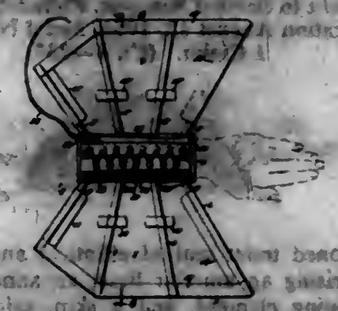
1. In a playground apparatus having vertical end supports, a top horizontal bar secured to said supports, a

cross-bar of reversed U-shaped formation mounted on said horizontal bar having movable members suspended therefrom, a brace for said cross-bar and said end supports on one end of said playground apparatus, said movable members including two hangar rods suspended



from said cross-bar and pivotally mounted for reciprocatory movement therein, said brace rigidly secured to the ends of said cross-bar and said end supports, said brace comprising two stringer members positioned in non parallel relationship, said stringer members connected by crossed struts connected to each other.

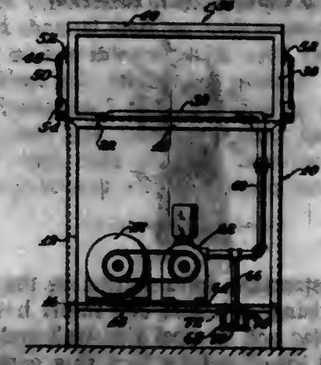
2,771,616
METAL BED RAIL CONSTRUCTION
William A. Dunean, Statesville, N. C., assignor to Acme Homes Metal Works, Inc., a corporation of North Carolina
Application May 4, 1953, Serial No. 352,861
3 Claims. (Cl. 5—286)



1. A metal bed rail for use with a head board and a foot board in forming a bedstead, said bed rail comprising two sheet metal plies having flat central longitudinal portions and disposed as a web portion for said bed rail, said sheet metal plies forming inner and outer faces of the web portion and being shaped to form a reinforcing bead along the top of said web portion, the lower edge of said web portion being angled in the form of a flange extending inwardly away from the outer face ply, and mounting brackets secured to said web portion at the ends thereof for assembling said bed rail with a head board and a foot board, said mounting brackets being secured to both plies of said web portion and thereby further serving to secure the structure of said bed rail in assembled relation.

2,771,617
MEANS FOR MOORING AND REFUELING BOATS, SEAPLANES, AND THE LIKE
Laurent H. J. Baudin, Woodside, N. Y., assignor, by mesne assignments, to Howard T. Jeandron, Keyport, N. J.
Application November 28, 1952, Serial No. 322,907
17 Claims. (Cl. 9—8)

13. An offshore refueling buoy which includes a floating vessel having a clear deck disposed above the surface of the water, a circular pipe shaped mooring track in the form of a wheel supported and affixed to the sides of the buoy above the water line when said buoy is in a buoyant but loaded condition, a mooring block mounted by means of rollers to pivot around the periphery of said track and to be moveable about the circumference of said track and said buoy, anchoring means provided to anchor said buoy in a predetermined non-shiftable non-rotatable position, a hollow well or bore extending through the center of said buoy from the deck to the bottom of said buoy, a hose line or conduit extending through said hollow well or bore having its upper end disposed above said deck, and means provided on deck for hoisting and supporting said upper end above said deck.



2,771,618
SWIMMING APPLIANCE
Harvey E. Cram, Santa Monica, Calif.
Application January 11, 1954, Serial No. 403,310
1 Claim. (Cl. 9—21)

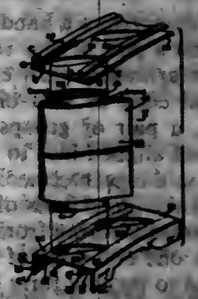
A swimming appliance comprising an elongated substantially flat member adapted to be affixed lengthwise to the under portion of the forearm of a swimmer, an elongated flexible cuff affixed lengthwise to the top of said member and adapted to be laced on to said forearm, ribs movably mounted to the underside of and extending downwardly at a small angle from the horizontal from each side of said elongated member and adapted to support a web affixed to the outer edges of said ribs and adapted to move substantially in a plane of a set of said ribs on each side of said elongated member forwardly to an expanded position and backwardly to a folded position, a web forming a fin extending from the outer edges of said ribs underneath said elongated means, said web adapted to flex and ribs adapted to move and together expand and form a fin under the pressure of water thereagainst in a downward swimming stroke and to retract and fold to avoid resistance on a return swimming stroke, said elongated substantially flat member having downwardly extending edges on each side thereof extending toward said ribs with each of said downwardly extending edges having an inclined edge corresponding to each rib so that said rib can ride down the incline thereof when said rib is placed thereagainst under the pressure of a downward swimming stroke.

2,771,619
VACUUM PRESS FOR BOOT AND SHOE MANUFACTURE
James W. Stewart, Providence, R. I., assignor to Stewart Company, Providence, R. I., a corporation of Rhode Island
Application December 2, 1953, Serial No. 395,719
2 Claims. (Cl. 12—1)

1. Apparatus for operating on parts of rubber shoes comprising a support, a frame-like manifold fastened to the support in a horizontal plane, a flexible elastic diaphragm fastened to the support at the underside of the manifold so as to enclose the lower side of the manifold and to form therewith a shallow compartment wherein the manifold constitutes a wall which rises from the diaphragm substantially above the support, said manifold having interiorly thereof exhaust ports, a carrier frame of larger area than the manifold pivotally mounted on the support for movement downwardly over the upper side of the manifold into contact with the support, means on the support for limiting downward movement of the carrier frame to a position in contact with the support below the top of the manifold a second flexible elastic diaphragm stretched taut on the carrier frame and movable therewith into contact with the manifold when the car-

rier frame is seated against the limit means on the support, means for exhausting air through the ports to the manifold from the space between the diaphragms when the movable diaphragm is in contact with the manifold, means operable to break the vacuum, and means normally operating to hold the movable diaphragm in an inoperative position away from the fixed diaphragm, said means being yieldable to permit the movable diaphragm to be moved into operative position with respect to the fixed diaphragm, and automatically operable to restore the movable diaphragm when the vacuum is broken to its inoperative position.

2,771,620
ARROW CONTAINER
Wessell S. Hoffman, Lake Orion, Mich.
Application February 6, 1956, Serial No. 563,636
1 Claim. (Cl. 150—1.5)



A hunting arrow quiver comprising: a lower supporting arm; a lower elongated member adapted to carry said lower arm; an upper elongated member slidably mounted on said lower elongated member; means adjustably securing said elongated members together; an upper supporting arm on the upper end of said upper elongated member; said arms having a recess on their inner adjacent sides; an elastic means in said recesses adapted to releasably retain a plurality of arrows between said arms; each of said elastic means being provided with a plurality of locating pins for retaining the arrows in predetermined positions on said supporting arms; said quiver being provided with a cover for enclosing the arrows carried thereby, which is adapted to be secured to the top supporting arm normally and adjacent to, but not in contact with said lower arm, and to be secured to said quiver along one side of said elongated members and to be in engagement with the other side of said elongated members but being free to be swung away from the quiver to permit the user to easily withdraw an arrow from the quiver.

2,771,621
POLISH REMOVER
Earl A. Robinson, Detroit, Mich.
Application May 28, 1954, Serial No. 431,186
3 Claims. (Cl. 15—21)

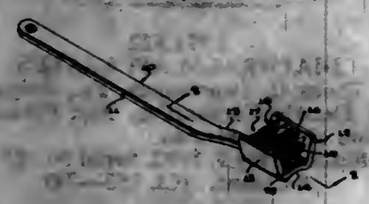
1. A nail polish remover comprising a vessel for holding a quantity of solvent, a cover member removably secured to the top of said vessel, and provided with a pair of openings therein, the portion of the cover element adjacent one of said openings constituting a finger rest for impinging beneath the first node of a person's finger, a sleeve member removably mounted within the other of said openings, a vertically reciprocal scrubbing element resiliently and freely mounted within said sleeve member, said scrubbing element being arranged to present its scrubbing surface for movement in a path adapted to vertically wipe the nail of a finger supported by the said finger rest, said vessel also being of greater depth than the length of that portion of the finger to be accommodated therein to an extent permitting a quantity of solvent to be accommodated below the finger tip, a plunger for manually depressing said scrubbing element into the lower portion of said vessel, and a spring resiliently mounting said scrubbing element within said sleeve member for returning said element to an upper position in said vessel, when manual pressure on said plunger is relieved.

2,771,622
DIAPHRAGM APPARATUS
Arthur G. Thorp II, Swarthmore, Pa., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application May 9, 1952, Serial No. 287,055
5 Claims. (Cl. 253—78)

5. Annular diaphragm structure comprising a sheet metal outer shroud member having circumferentially spaced apertures, a pair of laterally spaced sheet metal flange members flanking said apertures in the outer shroud member, a sheet metal inner shroud member having correspondingly spaced apertures, a pair of laterally spaced sheet metal flange members flanking the apertures in said inner shroud member, and a plurality of radially disposed tubular vanes, each of said vanes being formed of sheet

metal and having opposite tubular end portions of reduced cross-sectional area, said end portions extending through corresponding apertures in said inner and outer shroud members and being engaged with and secured to adjacent portions of said shroud members and of the respective flange members carried thereby.

---



2,771,623
**ADJUSTABLE MOUNTING DEVICES FOR WINDOW CLEANING SQUEEGEE AND OTHER ARTICLES**
Edward J. Baril, Brooklyn, N. Y.
Application August 20, 1952, Serial No. 305,397
3 Claims. (Cl. 15—144)

1. A tool outfit comprising, in combination, a cleaning tool having a slotted plate including a clamping device having a pair of jaws pivotally movable toward and away from each other, integral handles on the jaws for actuating the same, spring means for holding said jaws in closed position, an elongated tubular sleeve supported on one of said handles for mounting an elongated pole, an angular block removably clamped between said jaws, a threaded pin protruding from said block for insertion through the slot in said plate, and a nut on the pin for holding the tool on the pin.

---

2,771,624
**TOOTHBRUSH**
Rudolf Ripper, Washington, D. C., assignor to The Tri-Dent Corporation, a corporation of New Jersey
Continuation of application Serial No. 282,440, April 15, 1952. This application February 23, 1955, Serial No. 489,841
2 Claims. (Cl. 15—167)

1. A toothbrush comprising a handle, a U-shaped head including a bight and a pair of legs secured to said bight in diverging relation arranged transversely of said handle and having one end edge of said bight secured to one end of said handle, a pair of groups of bristle tufts arranged in longitudinal aligned face to face spaced relation positioned between said legs intermediate the ends thereof and projecting from the inner faces of said legs, the spacing between said groups tapering from the other end edge of said bight to the one end edge of said bight to which the handle is secured to thereby form between said groups a slot tapering from the other end edge of said bight to said one end edge thereof, each group embodying a plurality of longitudinally extending rows arranged in superimposed spaced relation with each row having a plurality of bristle tufts arranged in longitudinal aligned spaced relation, and another group of bristle tufts positioned between said legs adjacent said bight and arranged in intersecting relation with respect to said pair of groups and projecting from the inner face of said bight, said another group embodying a plurality of longitudinally extending rows spaced from one another with each row having a plurality of bristle tufts arranged in longitudinal aligned spaced relation, the outer face of said bight being provided with a groove extending longitudinally from said one end edge to which said handle is secured to the other end edge of said bight.

---

2,771,625
**BRUSH TUFT FASTENER**
Francis H. Palmquist, Rockville, Conn.
Application April 5, 1954, Serial No. 421,184
3 Claims. (Cl. 15—190)

1. Brush construction for insertion in the opening of a holder comprising, a bristle cup insert having a relatively thin circular and vertical side wall and closed and open upper and lower ends, a lock ring within said cup having a horizontal center beam disposed transversely thereof and semi-circular yieldable side arms extending clockwise from opposite ends of the beam and frictionally engaging opposite sides of the side wall of said cup and forming with the center beam vertical openings at opposite sides of said beam, elongate bristles having intermediate portions doubled over said center beam and opposite end portions thereof extending downwardly through said openings and downwardly and outwardly of said cup, and upper and lower portions of the side wall of the cup at opposite sides thereof being displaced inwardly as lugs at upper and lower sides of the lock ring restraining said ring against axial movement relative to said cup.

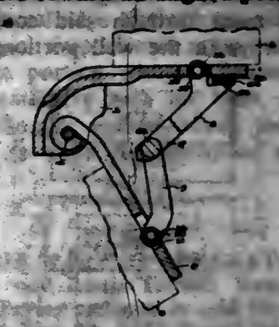
---

2,771,626
**SPRING ACTUATED SQUEEGEE HOLDING CLAMP**
James W. Toothman, Piedmont, Calif., assignor to Morse-Starrett Products Company, Oakland, Calif., a corporation of California
Application September 9, 1953, Serial No. 379,137
1 Claim. (Cl. 15—245)

In a squeegee construction, a handle terminating in a flat triangular portion, a substantially semicircular rib extending transverse to said handle adjacent the forward end of said triangular portion, a substantially triangular clip member pivotally fastened to said triangular portion of said handle, a substantially semicircular rib adjacent the forward edge of said clip member and complementary to the rib in the handle portion, an elongated U-shaped metal channel member having an enlarged portion at the bottom of the U adapted to be received in the said complementary ribs, said U-shaped channel member being substantially longer than the width of said triangular handle portion whereby said channel member may be shifted longitudinally in said complementary ribs, an elongated rubber blade member carried by said U-shaped channel member, said blade member having an enlarged portion received in the enlarged portion of said channel member, said clip member being provided with teeth extending along the forward edge thereof at approximately right angles to the surface thereof, said teeth extending beyond the flange of said U-shaped channel member and biting into and gripping said rubber blade member, said triangular clip member having a thumb engaging surface adjacent the rear corner thereof whereby pressure may be exerted on said thumb engaging surface in the direction toward said handle portion to pivot the forward edge of said clip member away from the forward edge of the handle portion to permit shifting movement of said channel member with respect to said handle, and spring means integral with said clip member and bearing against the triangular portion of said handle normally urging said thumb engaging surface of said clip away from said handle to urge said clip rib into engagement with said channel member and said clip teeth into engagement with said blade member.

---

2,771,627
**RECESSED HANDLE FOR DRAWERS, DOORS, AND THE LIKE**
Samuel Hammer, New York, N. Y., assignor to United Metal Box Co., Inc., Brooklyn, N. Y., a corporation of New York
Application April 15, 1953, Serial No. 348,896
6 Claims. (Cl. 16—124)



1. A recessed handle to be inserted in an opening in a wall comprising a U-shaped portion at one end thereof, the U-shaped portion having an outer and an inner leg, the legs being spaced a greater distance than the wall thickness received therein at least at the bottom of the U-shaped portion, means at the upper end of the U-shaped portion extending approximately to the plane of the outer leg of the U-shaped portion, the inner leg being longer than the outer leg and being of substantial length to provide contact for the ends of the fingers, a rearwardly extending wall projecting from the end of the inner leg of the U-shaped portion, and being relatively short approximating the thickness of the fingers, a downwardly and forwardly extending portion integral with the rearwardly extending wall providing a rear wall and a bottom wall extending forwardly, and locking means at the forward end of the bottom wall flexing toward the U-shaped portion upon inward movement thereof into an opening to secure the handle in a recess, the locking means being resiliently mounted for flexing towards the U-shaped portion.

---

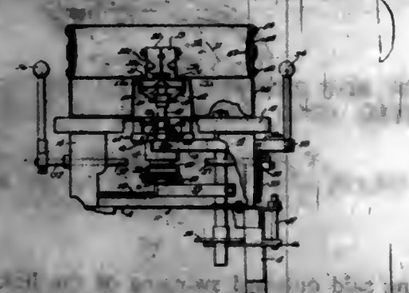
2,771,628
**MOTOR VEHICLE DOOR HINGE**
McFerrell Hoffmeyer, Pittsburgh, Pa., assignor to McKinney Manufacturing Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application July 15, 1954, Serial No. 443,525
6 Claims. (Cl. 16—138)

1. A door hinge comprising a pair of laterally spaced hinge plates, a vertical hinge pin connecting the outer ends of the plates, a pair of substantially parallel links between said plates, one end of each link being pivotally connected on a vertical axis to a different one of said plates with the links extending toward said hinge pin, means pivotally connecting the opposite ends of the links together so that when the hinge is opened the links will be swung outward toward an aligned position, means for

stopping said outward swinging of the links before they reach aligned position, said link connecting means including spring-pressed interengaging detents that resist initial inward movement of the links away from their outermost position when closing pressure is applied to the hinge.

---

2,771,629
**CLOSURE HINGE**
Otto C. Gentler, Detroit, Mich.
Application March 7, 1952, Serial No. 275,263
1 Claim. (Cl. 16—190)



A motor vehicle body hinge comprising a hinge bracket of bent sheet metal of approximately U-shaped cross-section having a pair of laterally-spaced parallel side walls with a connecting wall integral therewith and extending therebetween and with laterally-extending attachment flanges integral therewith and extending laterally from said side walls parallel to a section of said connecting wall, and a first spring anchorage on said connecting wall; a pivot element mounted on and extending between the side walls of said hinge bracket; a hinge arm structure of bent sheet metal having laterally-spaced parallel hinge arms pivotally mounted at their outer ends on said pivot element adjacent and parallel to the side walls of said hinge bracket, and having a spring anchorage member of bent sheet metal of approximately U-shaped cross-section with substantially parallel side walls connected to said hinge arms and with an integral bridge wall extending between said side walls, said spring anchorage member having a second spring anchorage thereon aligned with said first spring anchorage; and a tension spring secured at its opposite ends to said spring anchorages and extending therebetween.

---

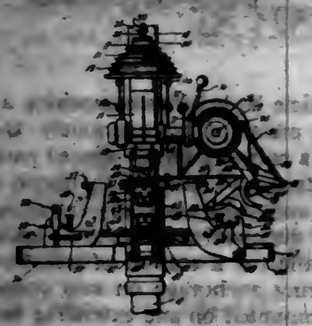
2,771,630
**CRAB MEAT EXTRACTOR**
Everett O. Hiller, Centerville, Miss., assignor to Hartford National Bank & Trust Company, Hartford, Conn., as trustee
Application August 26, 1954, Serial No. 452,900
8 Claims. (Cl. 17—3)

1. In apparatus for centrifugally extracting the meat from crabs, the combination of a holder mounted vertically for rotation on its axis, said holder having wall portions to support the skeletal portions of a core cylindrically cut from the body of a crab, said wall portions providing support for the skeletal portions adjacent openings in the core through which crab meat is discharged when the core is rotated with the holder and said wall

portions of the holder having passageways generally aligned with the openings in the core through which meat is centrifugally discharged when the holder and crab are rotated, drive means for rotating the holder to effect discharge of crab meat through said core openings and aligned passageways in the wall portions of the holder

and manually operable clutch means for operatively connecting the drive means and the holder and wherein the holder is a multipart unit including means which automatically open the holder parts when rotation of the holder stops and which automatically close the parts to support the skeletal portions of the core when the holder is rotated.

---



2,771,631

**APPARATUS FOR RECOVERY OF CRAB MEAT**

Everett O. Hiller, Hyannis, Mass., assignor to Hartford National Bank & Trust Company, Hartford, Conn., as trustee

Application November 12, 1953, Serial No. 391,510

12 Claims. (Cl. 17—3)

1. In a crab holding and core cutting device, a support for the carapace of an inverted crab, a first pair of prongs associated with the support and spaced to be received by the flipper sockets of the supported crab, a second pair of prongs associated with the support and movable into the eye sockets of the supported crab, spring means pressing said pairs of prongs toward each other to grip the crab therebetween, and a rotatable cylindrical cutter aligned with said crab support and movable into and out of cutting engagement with the supported and gripped crab.

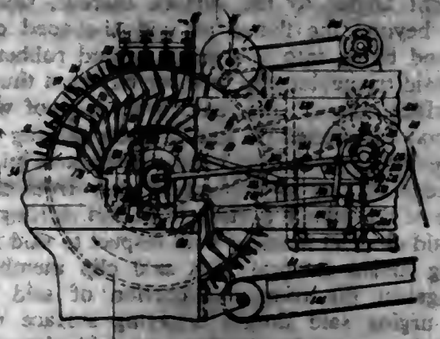
2,771,632



**MECHANISM FOR PREPARING FISH FOR CANNING**

Henry E. Walker, Bath, Maine, assignor to Walker's Fish-machinery, Inc., Bath, Maine, a corporation of Maine

Application January 20, 1953, Serial No. 333,668

5 Claims. (Cl. 17—4)

1. Apparatus for preparing fish for packing in cans, comprising a frame, a wheel rotatably mounted on said frame having a series of buckets at its circumference extending parallel to the axis of the wheel and each adapted to receive a single fish therein, means mounted at one side of said wheel for introducing single fish headfirst substantially simultaneously into a plurality of successive buckets near the top of the wheel, means mounted at the other side of said wheel for moving each fish rearward in its bucket into position for cutting off the head thereof, means on said frame automatically operating to clamp the body of each said fish in its bucket after being so located, two disc knives mounted on said frame adjacent to the circumference of the

wheel and rotatable about an axis parallel to the axis of the wheel, means on said frame for indexing the wheel to move the clamped fish into engagement with said knives, and means associated with said clamping means for thereafter releasing said fish bodies.

---

2,771,633

**METHOD OF PREPARING FINLESS FISH FILLETS**

Alfred Friedrich Adolf Bertels and Paul Friedrich Wilhelm Johannes, Lubeck, Germany, assignors to Nordischer Maschinenbau Rud. Baader, Lubeck, Germany

Application July 27, 1953, Serial No. 370,243

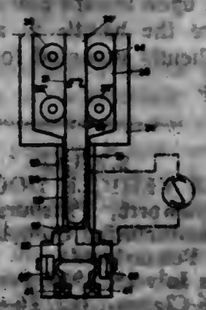
Claims priority, application Germany January 20, 1953

2 Claims. (Cl. 17—46)

1. A method for the preparation of fin-free fillets of fish comprising the steps of removing the head of the fish, incising both sides of the fish by parallel cuts extending on both sides of the backbone between the anus and the caudal fin, cutting off separately the belly fins and breast fins on both sides, cutting the fish for the removal of the lower fillet from the backbone, and cutting the fish for the removal of the upper fillet from the backbone.

---

2,771,634



**APPARATUS FOR THE MELT-SPINNING OF SYNTHETIC LINEAR POLYMERS**

Ettore Lazzatte, Milan, Italy, assignor to Perfogit Societa per Azioni, Milan, Italy

Application June 30, 1952, Serial No. 296,351

Claims priority, application Italy July 28, 1951

5 Claims. (Cl. 18—8)

1. Apparatus for spinning synthetic linear polymers from the melt, comprising a tubular melting chamber, means for continuously advancing therethrough, at a predetermined rate, a tubular solid polymer stock having substantially the same cross-section as said melting chamber,

a high frequency oscillating electric field comprising two coaxial cylindrical condenser plates constituting the inner and outer bounding surfaces of a section of said melting chamber, for melting said tubular polymer stock in said tubular melting chamber, a closed chamber contiguous to and merging with said melting chamber for collecting the molten polymer, and spinning pumps communicating with said collecting chamber for delivering the molten polymer to spinning nozzles.

---

2,771,635

**APPARATUS FOR STRETCHING FILAMENTS**

Werner Mitsch, Cesano Maderno, Italy, assignor to Perfogit Societa per Azioni, Milan, Italy

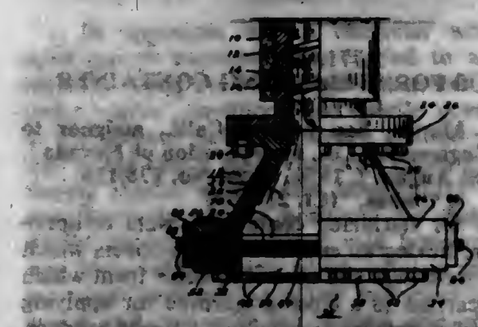
Application February 13, 1952, Serial No. 271,344

Claims priority, application Italy March 14, 1951

10 Claims. (Cl. 18—8)

1. In an apparatus for the drawing of filaments and bundles of filaments, in combination with a low speed thread advancing device for feeding the filaments and a high speed thread advancing device for drawing the same away, the ratio of the high to the low speed being such as to cause the filaments to become stretched to several times their original length, a friction device interposed between said thread advancing devices and comprising a substantially elliptical snubbing element having a sliding frictional engagement with the filaments, said snubbing elements deflecting the filaments, at the point of engagement therewith, from a straight line between said low speed thread advancing device and said high speed thread advancing device and being displaceable to vary the degree of said deflection, the deflected filaments reacting on said displaceable snubbing element by a pressure, urging the element to become so displaced as to reduce said deflection to a minimum, and means for constantly urging said displaceable snubbing element to become so displaced as to increase said deflection against the increasing reaction pressure of the filaments until said pressure has reached a predetermined equilibrium intensity.

---



2,771,636

**APPARATUS FOR EXTRUDING THERMOPLASTIC MATERIAL**

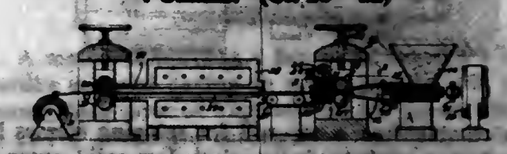
Walter W. McIntosh, Indian Orchard, and John Mosiek and Oscar L. Smith, Springfield, Mass., assignors to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

Application July 22, 1953, Serial No. 369,594

4 Claims. (Cl. 18—12)

1. In combination in an extruder, an elongated casing defining a lengthwise bore therein, a rotatable screw mounted within said bore, a transverse slot of uniform cross section in the elongated casing between the end of the screw and the discharge end of the casing, said slot intersecting the entire peripheral edge of the bore, a snugly fitting breaker plate assembly slidably mounted in said slot, the length of the breaker plate assembly being less than that of the slot, but sufficient to completely intersect the peripheral edge of the bore, said breaker plate assembly having an imperforate marginal portion and a central perforate portion whose cross-sectional area is substantially coextensive with the bore, and removable stop means in the slot against which the breaker plate assembly abuts to align the perforate portion thereof with the bore.

---



2,771,637

**STRIP MAKING APPARATUS**

John E. Silvany and Louis Taylor, Youngstown, Ohio; said Taylor assignor to said Silvany

Application June 30, 1951, Serial No. 234,524

4 Claims. (Cl. 18—12)

1. Apparatus for making continuous metal strips from powdered metal comprising a pair of pressure rolls in direct contact with the powdered metal, a conduit in contact with the rolls and extending into the space between the rolls for supplying powdered metal to said rolls, power driven means for forcing the powdered metal through said conduit into the space between said rolls, and spaced plates adjacent the opening between said rolls in frictional engagement with both sides of said strip for resisting the translation of the powdered metal between the said rolls and exerting a force in said strip opposite to the force produced by said power driven means thereby increasing the pressure in the powdered metal between said rolls, the inner ends of said plates having tapered edges in contact with the rolls and disposed adjacent the vertical plane through the axis of rotation of said rolls.

---

2,771,638

**HIGH SPEED EXTRUSION COMPOSITION**

Martin Sale and Oliver W. Kaul, Rochester, N. Y., assignors to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey

No Drawing. Application March 2, 1954, Serial No. 413,714

4 Claims. (Cl. 18—59)

1. A paste coating composition comprising cellulose acetate butyrate admixed with a ternary solvent mixture comprising at least 50% toluene, 10%–30% hexane and at least 10% acetone.

4. A process for high speed extrusion comprising dissolving cellulose acetate butyrate granules having about 37% butyryl content in a ternary solvent mixture comprising at least 50% toluene, 10%–30% hexane and at least 10% acetone, extruding the mixture onto a metal strip, at room temperature and curing.

---

2,771,639

**SYSTEM FOR DRAFTING FIBROUS MATERIALS**

Jose Maria Booth Aymerich, Barcelona, Spain

Application May 28, 1951, Serial No. 228,256

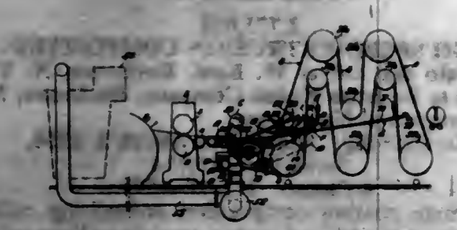
Claims priority, application Spain July 3, 1950

2 Claims. (Cl. 19—120)

1. A drawing mechanism for a strand of textile fibers comprising a plurality of drawing units, each of said

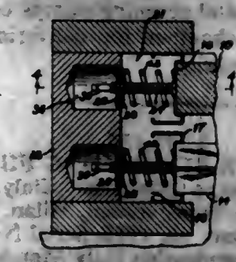
units including a pair of feed rolls, a pair of drawing rolls and a condenser, and at least one revolving guiding roll between a drawing roll of one unit and a feed roll of the next unit, said guiding rolls forming together with the surface of said feed rolls and drawing rolls a continuous support for the strand of fibers from its exit from one drawing unit to its intake by the next drawing unit.

---



2,771,640
**TOP ROLL FOR SPINNING AND ROVING FRAMES**
Louis M. Cotchett, Whitinsville, Mass.
Application September 11, 1953, Serial No. 379,680
6 Claims. (Cl. 19—142)

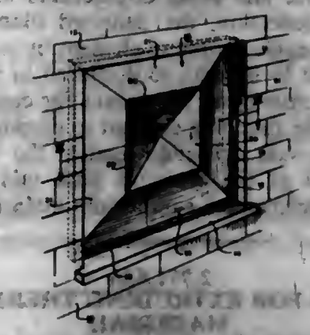
3. In combination, a top roll for spinning frames having two bosses each having a pintle-less solid outer end and a recess in its inner end, a shaft fixed and terminating in the recess of each boss intermediate the length of the latter, a tubular member around the shaft, bearing balls within each recess supporting such member from the surfaces of the recesses, and a guide on the spinning frame in the form of an inverted channel member with notches in its side webs straddling the tubular member.



---

2,771,641
**AUTOMATIC APPARATUS FOR ACCUMULATING FIBERS DELIVERED BY CONTINUOUSLY OPERATING CARDING MACHINERY**
Hubert Charles Marie Henri Desmarq, Henry, Belgium
Application January 23, 1951, Serial No. 207,393
Claims priority, application Belgium December 5, 1950
6 Claims. (Cl. 19—161)

1. A device of the class described for receiving and accumulating a thin fleecy web of carded fibers produced by continuously operating carding machinery, and forming said web into an endless wad of predetermined weight per unit of its length, said device comprising: a movable endless conveyor belt having an adherent surface to which said web of fibers will cling for receiving and retaining said web thereon; delivery means for receiving said web from said carding machinery and depositing said web on said adherent surface; controllable driving means for causing continued movement of said belt past said delivery means, repeated passages of said belt past said delivery means causing said web to accumulate thereon in superposed layers with the outer layers clinging to each other; control means for starting and stopping the operation of said driving means; means connected to said control means for starting the operation of said driving means; controllable pneumatically operated return means extending between said delivery means and said carding machinery for returning said web from said delivery means to said carding machinery for re-use; measuring means operative in accordance with a predetermined amount of continued movement of said belt past said delivery means,



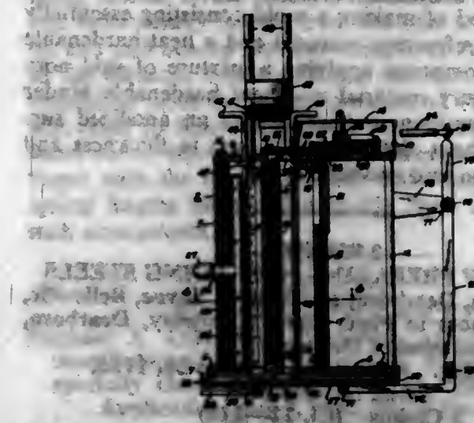
2,771,642
**ANCHOR FOR RESILIENT WINDOW STRIPS**
Albert Czys, Cicero, Ill., assignor to Durbin Metal Strip Manufacturing Company, Inc., Cicero, Ill., a corporation of Illinois
Application July 28, 1954, Serial No. 446,383
1 Claim. (Cl. 20—12)

An anchor for fastening a resilient window strip to a laterally facing surface of a window frame, comprising a flat, elongated, substantially rectangular metal plate with a pair of thin fingers partly punched out therefrom into positions at right angle thereto but left attached thereto, said plate being slightly less wide than said surface, being substantially longer than wide and having a pair of holes formed therein, one in each terminal part thereof, whereby the plate can be rigidly secured to said surface; a nut slidably held by said pair of fingers; a screw threaded into the nut from beyond the plate and a compression spring interposed between the plate and the head of the screw, whereby a window strip can be resiliently spaced from the plate and thereby from the window frame.

---

2,771,643
**WINDOW CLOSURE**
Victor I. Zelov, Rosemont, Pa.
Application September 22, 1952, Serial No. 310,760
1 Claim. (Cl. 20—40)

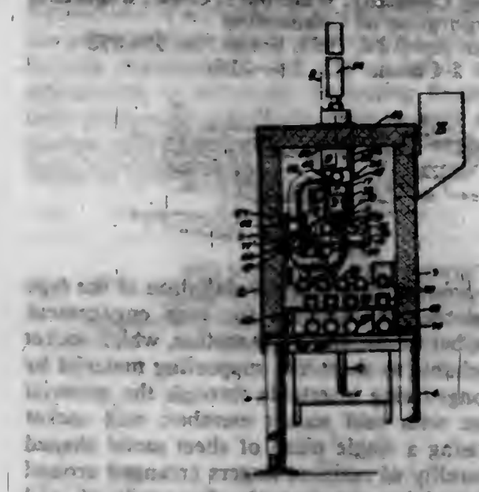
A window closure consisting of a unitary molded sheet of reinforced plastic comprising a rectangular peripherial portion, a frusto-pyramidal intermediate portion, and a reversed pyramidal central portion whose base coincides with the top of the frusto-pyramidal intermediate portion.



---

2,771,644
**APPARATUS FOR STERILIZING CONTAINER COVERS**
William McK. Martin, San Mateo, Calif., assignor to James Dole Engineering Co., a corporation of Nevada
Application August 7, 1950, Serial No. 178,116
4 Claims. (Cl. 21—78)

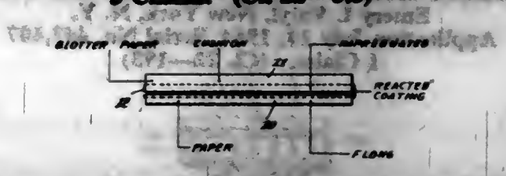
1. Apparatus for sterilizing container covers comprising, an enclosure having an entrance for the covers which is open to the atmosphere and an exit therefor from which the covers are carried to a closing machine for applying the covers to sterile containers containing a sterile product, means for conveying the covers through said enclosure, said conveying means including a plurality of substantially parallel cooperable rotatable screws spaced apart a distance substantially equal to the diameter of said covers, for supporting said covers in a spaced apart columnar ar-



rangement and for rotating them as they are thus supported, gas distributing means adjacent to and extending in an axial direction along said screws, said gas distributing means having a plurality of gas-emitting apertures spaced axially along said gas distributing means and along said screws for directing a sterilizing gas into the spaces

between the covers and against the edges of the covers as they are rotated, and means for introducing a flow of sterilizing gas into said gas distributing means, said gas being heated to a temperature at substantially atmospheric pressure substantially in excess of 212° F. for sterilizing said covers as they are moved through said enclosure and maintaining sterile conditions in said enclosure.

---

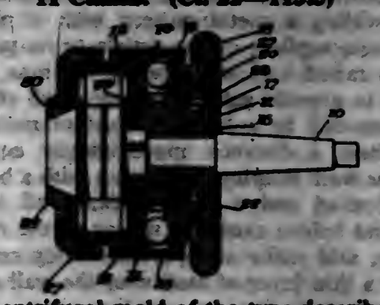


2,771,645
**APPARATUS FOR STERILIZING FOOD CONTAINERS**
William McK. Martin, San Mateo, Calif., assignor to James Dole Engineering Co., a corporation of Nevada
Application December 4, 1950, Serial No. 199,020
4 Claims. (Cl. 21—80)

1. In apparatus of the character wherein sterilized open mouth containers are carried to a filling mechanism for filling the containers with a sterile food product under sterile conditions and sterile covers are applied to the product filled containers, a food container sterilizer comprising a main enclosure housing, container conveying means within said housing for supporting the containers in upright position, gas distributing means within and extending along said housing, a hood separate from said housing which extends within said housing, said hood having a top wall over said distributing means and side walls one at each side of said conveying means thereby providing a heat confining passageway for said containers on said conveying means, said side walls of said hood providing guide means against which said containers on said conveyor can slide and said gas distributing means having orifices leading into said hood above and below said containers to inject heated sterilizing gas into the mouths of said containers to heat the inside of the containers and sweep out air therefrom, and to direct sterilizing gas against the bottoms of said containers on said conveyor.

---

2,771,646
**MATRIX USED IN PRINTING AND METHOD OF MAKING THE SAME**
Eduard A. Schuman, Malverne, N. Y., assignor of one-half to Fred W. Hoch, Forest Hills, N. Y.
Application June 7, 1951, Serial No. 230,383
3 Claims. (Cl. 22—5.5)

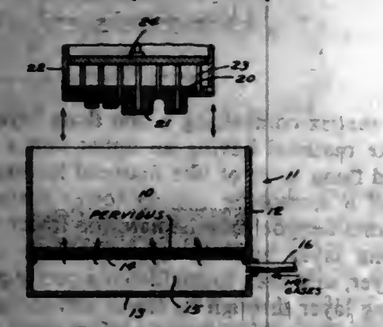


1. A matrix comprising a first flong layer of a blotting paperlike material having an upper and a lower surface, a second flong layer of like material having an upper surface and a stereotype casting lower surface, a layer of urea formaldehyde intermediate the lower surface of said first flong layer and the upper surface of said second flong layer, said urea formaldehyde partly penetrating said first flong layer through its lower surface and said second flong layer through its upper surface, said urea formaldehyde being completely reacted, said stereotype casting surface of said second flong layer carrying type impressions to be reproduced and relief portions therebetween, said relief portions being formed of said three layers, and said upper surface of said first flong layer having a contour closely following said relief portions formed of said three layers, whereby said matrix is given sufficient rigidity to withstand casting pressures.

2. The method of making a matrix which consists in subjecting a first side of a first sheet of a blotting paperlike material to urea formaldehyde for partial penetration of said first sheet, adding a catalyst to said urea formaldehyde, placing a second sheet of like material in faying relationship with said first side of said first sheet, whereby said urea formaldehyde partially penetrates said second sheet, subjecting the second side of said second sheet to pressure for forming stereotype depressions therein having relief portions therebetween and for completely reacting said urea formaldehyde to form a unitary relatively rigid member, with the said reacted urea formaldehyde between and partially penetrated into said first and said second sheet, said unitary member having a contour closely following said stereotype depressions and relief portions, whereby said member is adapted to retain the contour of said stereotype depressions and of said relief portions during the casting process.

---

2,771,647
**LOCKING MEANS FOR CENTRIFUGAL MOLDS**
Albert B. Hemstreet, East Haddam, Conn.
Application June 9, 1953, Serial No. 360,547
11 Claims. (Cl. 22—113.5)



1. In a centrifugal mold of the type described, in combination, a pair of substantially cylindrical telescoping

parts forming a molding cavity when assembled, each of said parts having at least one recess in the overlapping area of the parts, a ball held in the recess of one part and radially movable under centrifugal force to project partially into the recess of the other part to lock the parts together, and means mounted on said one part and having limited rotation with respect thereto to project said ball into the recess of said other part at one extreme of the rotary movement of said means.

---

2,771,648
**CURING SHELL MOLDS IN FLUIDIZED BEDS**
Emery I. Valyi, New York, N. Y.
Application July 14, 1954, Serial No. 443,497
1 Claim. (Cl. 22—193)

In a method of heat curing a mold shell, the steps of holding a partially cured mold shell, composed of a refractory material and a heat curable binder on a pattern in face downward relationship, moving said pattern with said partially cured mold shell thereon relatively to and into contact with a mass of particles of a substance inert to the material of said mold shell, passing a hot gas through said mass of particles to maintain said particles heated to curing temperature, and to cause said particles to move continuously, the presence of the gas being such as to cause the said continuously moving particles to hold said mold shell against said pattern during the heat curing of the mold shell, and the fluid condition of said particles causing said particles to come into contact with and to heat uniformly the entire surface of said mold shell, moving said mold shell relatively to and out of contact with said mass of particles after said mold shell is cured, and mechanically stripping said mold shell from said pattern.

---

2,771,649
**REMOTE STRIKE OFF**
Julius M. Biesecker, Detroit, Mich., assignor to Ford Motor Company, Dearborn, Mich., a corporation of Delaware
Application August 12, 1953, Serial No. 373,810
2 Claims. (Cl. 22—193)

1. The process of producing a molding element comprising providing a metal pattern with a planar sand receiving base, replicas of the article to be produced on the base, a raised wall surrounding the base, and holes in the base to provide gates and risers, each of said holes being surrounded by a boss or mass of metal elevated from the base a distance approximately equal to the height of the wall, heaping the pattern with a heat settable mixture of sand and a resin, striking off the pattern promptly and before excessive setting of the mixture has taken place, said strike off operation being conducted so as to leave a thin layer of sand over the wall and bosses, and finally applying heat to cure the mixture in the pattern and cause differential shrinkage of the mixture.

2,771,650
**SHELL MOLDING**
Philip R. White, Detroit, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
No Drawing. Application February 4, 1952, Serial No. 269,909
3 Claims. (Cl. 22—193)

2. The method of making a mold consisting essentially of nonmetallic refractory material and a heat hardenable binder which comprises applying a mixture of said nonmetallic refractory material and heat hardenable binder to a heated aluminum pattern having an anodized surface layer of about .0001 to .0002 inch in thickness and carnauba wax on said anodized layer.

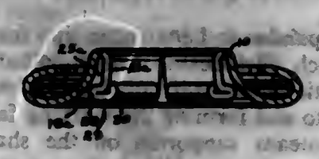
---

2,771,651
**METHOD OF PREPARING NON-AGING STEELS**
Eric R. Morgan, Dearborn, and John C. Shyne, Belleville, Mich., assignors to Ford Motor Company, Dearborn, Mich., a corporation of Delaware
No Drawing. Application October 28, 1955, Serial No. 543,611
3 Claims. (Cl. 22—215)

1. The process of producing a rimmed steel which is substantially non-aging under usual conditions of commercial storage comprising establishing in a mold a mass of molten steel of rimming composition and having a boron content insufficient to detrimentally affect the rimming action, permitting the rimming action to proceed until a skin has been formed and after said skin has been formed chemically capping the steel, said process being further characterized by the alloying of the steel with sufficient boron to yield a final boron content of 0.002% to 0.02%.

---

2,771,652
**SNAP FASTENER SOCKET**
Jesse Barratt, Naugatuck, Conn., assignor to Scovill Manufacturing Company, Waterbury, Conn., a specially chartered corporation of Connecticut
Application April 24, 1953, Serial No. 350,873
1 Claim. (Cl. 24—216)



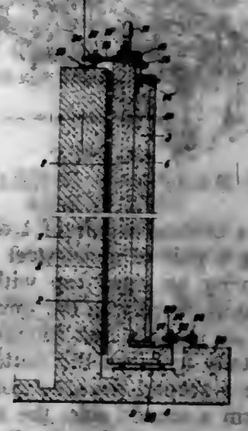
In a laundry-proof snap fastener installation of the type having a socket member adapted for snap engagement with a stud member of circular cross section, which socket member is attachable to sheet-like supporting material by means of a pronged ring insertable through the material into engagement with said socket member; said socket member comprising a single piece of sheet metal shaped to provide a plurality of resilient fingers arranged around a central stud-receiving opening, the free ends of said fingers being turned radially inwardly to form stud-gripping beads, and a breast portion surrounding said fingers and having its inner lower edge integrally joined to said fingers, said breast portion comprising a conical wall sloping upwardly and outwardly at an angle of approximately 10° to the central axis of the socket member in a straight line up to the region of said gripping beads, said breast portion extending from such point around a short curve to a prong deflecting surface which extends in an arc of relatively large radius upwardly and outwardly in the general direction of about 110° to the central axis of the socket member and directly from said arc into a U-shaped annular rim the bottom portion of which extends inwardly toward said conical wall to provide a prong-retaining ring; said fingers extending upwardly from their points of connection with the breast portion in outwardly bowed

fashion approximately parallel to said conical wall, the upper ends of the fingers terminating in rolled lips which turn inwardly toward the axis of the socket and downwardly and back so that their extreme edges are directed outwardly from the socket axis, said rolled lips providing the stud-engaging beads above referred to, said beads being closest to the socket axis at their central portions and substantially farther from the axis at each side thereof, and said beaded portions being in such close proximity to the adjacent breast wall that the side portions as distinguished from the central portions of one of the fingers will come to bear against said conical wall adjacent said short curve when undue lateral stress comes upon such finger with the result that any distortion of any of the spring fingers beyond the elastic limit is prevented by such engagement.

---

2,771,653
**SNAP FASTENER SOCKET**
Michael J. Carpinella, Waterbury, Conn., assignor to Scovill Manufacturing Company, Waterbury, Conn., a specially chartered corporation of Connecticut
Application May 9, 1952, Serial No. 287,015
2 Claims. (Cl. 24—216)

2. A snap fastener socket member comprising a circular series of resilient fingers and a surrounding annular breast portion, said breast portion being in the form of a curved anvil section starting and sloping outwardly from one end of the fingers and terminating in an inturned curved clincher rim, said fingers being arranged in substantially cylindrical formation and terminating in a formed end of a character wherein inwardly formed beads are provided that define an opening adapted to have snap locking engagement with a stud head, and said beads terminating in outwardly projecting flanges having their ends positioned sufficiently close to said anvil section to prevent said fingers from being bent beyond their elastic limits by lateral stresses.



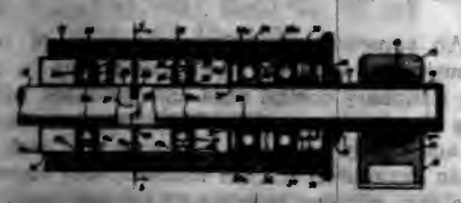
---

2,771,654
**SELF-ENGAGING HOOK**
Lester B. Meiers, Dunellen, N. J.
Application June 14, 1950, Serial No. 167,970
14 Claims. (Cl. 24—230.5)

2. A hook structure having a hook portion, an erect neck portion, and a shank portion disposed between said hook and neck portions and joining them together, said hook, neck, and shank portions being formed in one single piece, said hook portion defining a partial helix, said shank portion being angularly bent relative to the axial centre of the neck portion, and said shank portion being also concavo-convexly curved substantially throughout the length thereof.

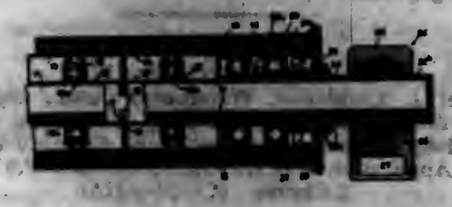
2,771,655
**PROCESS OF MANUFACTURE OF FORCED PIPINGS MADE OF PRECOMPRESSED CONCRETE, AND RELATIVE EQUIPMENT**
Pier Luigi Nervi, Rome, Italy
Application November 25, 1952, Serial No. 322,432
Claims priority, application Italy November 27, 1951
6 Claims. (Cl. 25—36)

1. A process of manufacturing reinforced precompressed concrete pipes, comprising pre-arranging a stationary central rigid core and expansible means which coaxially surround said core, arranging a pre-fabricated concrete shell consisting of a reinforcement of untensioned high tensile strength steel wires covered by a thin layer of concrete, said shell being coaxial to the said stationary core and being distanced from said expansible means to form an annular space, pouring concrete in said annular space, submitting it to a pressure from the inside of said concrete by means of said expansible means, the water contained in said poured concrete escaping through the wall of said shell and the said steel wires becoming tensioned, keeping said poured concrete under compression until the drying and the hardening thereof is completed, removing the said pressure from the inside and separating said expansible means from said hardened poured concrete, whereby the said tensioned steel wires compress said hardened poured concrete from the outside and said outer concrete shell and said hardened poured concrete form a single pipe, wherein said poured concrete is under the compression exerted by said steel wires.



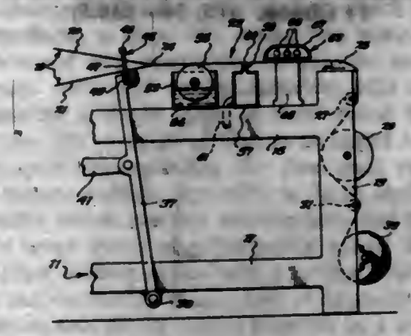
3. An apparatus for the manufacture of reinforced pre-compressed concrete pipes, comprising in combination a stationary central rigid core provided with a projecting circular base, a plurality of staves adjacent each other and tightly arranged with respect to each other to form an expansible cylinder member, said staves resting on the said circular projecting base and being radially movable on the said base with respect to the said stationary central core, a plurality of expansible bags adjacent each other between the said central core and the said plurality of staves, said bags being in communication with a hydraulic pressure source and pre-arranged to expand to radially move said staves from the said central core, hand operable means which adjustably connect said staves and said central core to limit the distance to which said staves may be moved from said central core sealing members associated with each stave at the bottom is adjacent the outer surface of the stave and the other leg of which projects outwardly from the stave.

2,771,656
CASTING FORM
Eugene M. Swanson, Hazelcrest, Ill., assignor to Calumet Flexicore Corporation, East Chicago, Ind., a corporation of Indiana
Application November 23, 1953, Serial No. 393,569
4 Claims. (Cl. 25—121)



1. A form for casting a pair of L-shaped beams, said form comprising a pair of sheet steel casting units, each casting unit having an open top with a straight inside wall extending downwardly to the unit bottom, the sheet steel continuing to make a first rounded corner and continuing horizontally to make the bottom and then being shaped to make a second rounded corner and extending upwardly to form a second side, the steel of said second side being shaped to provide an offset near the top of said form, said offset extending away from the first side and the steel continuing straight up to the open top of the form, means for securing said two casting units so that the straight inner side portions are disposed in opposed parallel relation, a reinforcing plate extending along the bottom of both units up to but short of the second rounded corner of each unit, means for maintaining the top free edges of the inside walls in fixed predetermined relation, removable means across the top of said form for bolting the outer sides in predetermined relation, bulkheads for the form ends, the outer sides of the two form units being springable outwardly on their respective second corners to release the cast beam, and reinforcing means at the outer sides of each form unit, said reinforcing means extending downwardly for limiting the springing of the forms.

2,771,657
EXPANDER AND CONTRACTOR ROLL
Louis M. Gagnont, North Adams, Mass., assignor to James Hunter Machine Company, North Adams, Mass., a corporation of Massachusetts
Application August 3, 1953, Serial No. 371,887
8 Claims. (Cl. 26—63)



1. An expander and contractor roll for flexible sheet material, which comprises a stiff longitudinally curved shaft, generally cylindrical roll sections surrounding but spaced from the shaft and disposed in end-to-end relation, an elastic sheath closely surrounding the roll sections, a series of generally cylindrical spacers surrounding and supported on the shaft within the roll sections and rotatable relative to the shaft except as hereinafter specified, bearing means rotatably mounting the roll sections on the spacers and securing each roll section against longitudinal movement relative to the spacer within it, the spacers being slidable along the shaft but interconnected in end-to-end relation to space the roll sections from each other along at least part of their ends, an abutment on each spacer engageable with an adjacent spacer to prevent rotation of the spacers relative to each other, and means for holding one of the spacers against rotation on the shaft, whereby said one spacer and the abutments on the spacers hold all of the spacers against rotation relative to the shaft.

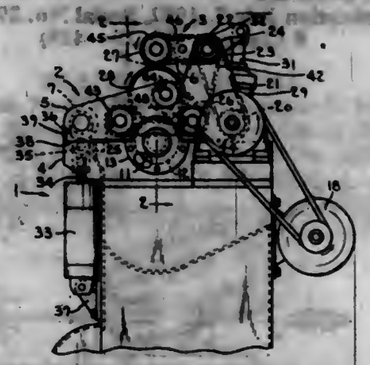
2,771,658
ROLL FOR EXPANDING AND CONTRACTING TEXTILES
Frank B. Merrill, North Adams, Mass., assignor to James Hunter Machine Company, North Adams, Mass., a corporation of Massachusetts
Application August 3, 1953, Serial No. 371,949
5 Claims. (Cl. 26—63)

1. In an expander and contractor roll for flexible sheet material, which includes a stiff longitudinally curved shaft, an elastic sheath surrounding the shaft in spaced relation thereto and forming the working face of the roll, and bearing means supported on the shaft within the sheath and mounting the sheath for rotation relative to the shaft, the improvement comprising, at each end portion of the shaft, a sleeve fitted closely around the shaft, a cap in sealing contact with the flexible sheath around the end thereof and rotatable with the sheath, intercontacting annular members on the cap and sleeve, respectively, forming a seal around the shaft, the sleeve having an extension projecting from said annular member on the sleeve toward the corresponding end of the shaft, and a bracket supporting said end of the shaft and clamping the sleeve extension around the shaft, whereby the bearing means are sealed at the end of the flexible sheath.

2,771,659
PROCESS OF FORMING A DURABLE OPEN MESH FABRIC
Albert L. Ball, Worcester, Mass., assignor to Bay State Abrasive Products Company, Westboro, Mass., a corporation of Massachusetts
Application July 2, 1953, Serial No. 365,641
12 Claims. (Cl. 28—73)

1. A process for making strong, durable, open mesh fabrics which comprises weaving an open mesh fabric and thereafter, prior to the occurrence of distortion of the meshes of said fabric and to such contact with said fabric as will tend to displace the filling yarns thereof, and while the warp yarns of said fabric are under loom tension, coating the yarns of said fabric with a liquid adhesive, breaking any films of said adhesive blinding the mesh openings of said fabric, and setting said adhesive.

2,771,660
MANUFACTURE OF CREPE YARNS AND FABRICS FROM NYLON
Charles Ray Eshland, Greensboro, N. C., assignor, by mesne assignments, to Patentex, Inc., New York, N. Y., a corporation of New York
No Drawing. Application September 25, 1951, Serial No. 248,283
10 Claims. (Cl. 28—76)

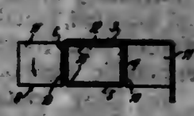


1. A method of making a crepe yarn, at least partially of nylon, which comprises twisting a yarn, setting the twist therein by heating the twisted yarn for at least one-half hour to a temperature between about 135° and 155° F. in an atmosphere of relative humidity of at least 50%, then treating the yarn by heating it for at least 15 minutes to a temperature of between 190° to 300° F., conditioning the yarn for at least 8 hours at a temperature of 60° to 80° F. in a medium of 50% to 80% relative humidity, and then untwisting the yarn.

2,771,661
RAINPROOF FABRIC
Boutwell H. Foster, Maplewood, N. J., assignor to United States Rubber Company, New York, N. Y., a corporation of New Jersey
Application October 15, 1953, Serial No. 386,161
10 Claims. (Cl. 28—80)

1. A rainproof fabric comprising a fabric having a water resistant coating applied to only a portion of its surface area to leave other portions thereof uncoated, said fabric being arranged so the uncoated portions thereof underlie the coated portions thereof so air may enter under said coated portions, and yarns interwoven with said fabric at spaced apart points along the length of said yarns, said yarns being shorter than said fabric whereby the yarns hold said uncoated areas underlying said coated portions.

2,771,662
RING CUTTING MACHINE
Adam Zinke, Wauwatosa, Wis.
Application August 20, 1954, Serial No. 451,214
3 Claims. (Cl. 29—70)



1. A ring cutting machine for simultaneously cutting a plurality of rings from a tube comprising a plurality of circular saws rigidly clamped together, all of said circular saws being of the same diameter, power means for rotating said saws, a plurality of rollers for supporting said tube and for clamping said tube between said rollers, clamping means for moving said rollers relatively to each other to clamp the tube in place and for moving the rollers relatively to each other to release the rings after they have been cut from the tube, a pair of pivotally mounted spaced heads revolubly supporting said rollers and supporting said clamping means, said heads, rollers, clamping means and tube constituting a unitary assembly with the tube clamped in place and said assembly being rockable as a unitary structure with the tube clamped in place, feeding means for rocking the assembly consisting of the heads, rollers, clamping means and tube, towards said saws until said saws have cut completely through said tube, and power means for rotating said rollers to thereby rotate said tube whereby a plurality of rings are simultaneously cut from said tube.

2,771,663
METHOD OF MAKING MODULAR ELECTRONIC ASSEMBLIES
Robert L. Henry, Jr., Silver Spring, Md., assignor to the United States of America as represented by the Secretary of the Navy
Application December 4, 1952, Serial No. 324,160
17 Claims. (Cl. 29—155.5)
(Granted under Title 35, U. S. Code (1952), sec. 266)

13. The method of making modular electronic units from ceramic wafers having edge notches and a plurality of conductive risers comprising the steps of metalizing the wafer notches, printing circuit patterns on the wafers and in contact with some of the metalized notches, fixing electronic components to the wafer surfaces and in engagement with said patterns, holding the wafers spaced apart and in parallel planes, applying the risers in aligned wafer notches, and thermo-mechanically fixing the risers to the wafers to maintain the wafers spaced apart.

2,771,664
MAGNETIC CORES FOR ELECTRICAL INDUCTION APPARATUS AND THE METHOD OF PRODUCING SAME
Clarence G. Dunke, Webster Groves, Mo., assignor to Moloney Electric Company, St. Louis, Mo., a corporation of Delaware
Application March 14, 1952, Serial No. 276,618
4 Claims. (Cl. 29—155.57)

1. The method of producing a magnetic core loop from magnetic tape comprising forming the leading end of said tape into a rectangular stiffening element, winding the tape as a coil around a core form having a recess in which said stiffening element is disposed, securing the trailing end of said tape to the outside of said coil, separating said core form from said coil thereby forming a central window of said coil in which said stiffening element is disposed, one pair of oppositely facing surfaces of said stiffening element bracing opposite interior surfaces of the coil with sufficient rigidity to withstand the effects of forces produced incident to processing said coil, the remaining pair of stiffening element surfaces being spaced from the other interior surfaces of said coil,

heat treating said coil and the integral stiffening element assembly at annealing temperatures, and removing the stiffening element from said coil window.

2,771,665
FABRICATION OF BRANCHED FITTINGS
Allan W. Beaty, Franklin Township, Allegheny County, Pa., assignor to Welding Fittings Corporation, New Castle, Pa., a corporation of Pennsylvania
Application April 28, 1952, Serial No. 284,985
1 Claim. (Cl. 29—157)

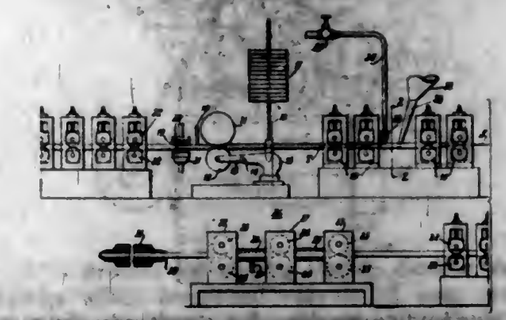
In a method of fabricating a branched fitting from a length of metal tubing or pipe stock provided with a generally oval cross section, the steps comprising, in combination, pressing said tubing intermediate its ends in alignment with the major transverse axis of said oval cross section between a die outside said tubing and a die mandrel having a boss thereon inside said tubing to cause said boss to form a land in said tubing at right angles to the axis thereof, said mandrel having a cross-sectional area substantially smaller even after said pressing than the internal cross-sectional area of said tubing, withdrawing said mandrel, thereafter simultaneously compressing said tubing in the same direction as that of said pressing, said compressing being performed substantially only by dies in external contact with substantially the entire transverse external surface of said tubing, said compressing further being substantially transverse to the axis of said tubing to reduce the diameter through said axis of said tubing and to increase the height of said land, the end edges of said tubing and the outermost end of said land being free of axial abutment by said dies during said compressing, repeating such compressing with relatively smaller external dies and no internal dies until relatively circular, cross-sectioned finish dimensions of said tube and closed end land are obtained, and then removing the outermost end of said land to provide an open branch in said fitting.

2,771,666
REFRACTORY BODIES
Ivor E. Campbell, Columbus, and Bruce W. Gonser and Carroll F. Powell, Columbus, Ohio, assignors, by mesne assignments, to Fansteel Metallurgical Corporation, North Chicago, Ill., a corporation of New York
No Drawing. Application March 18, 1950, Serial No. 150,542
8 Claims. (Cl. 29—198)

1. As an article of manufacture, a refractory metal body, comprising a refractory metal base selected from the group consisting of tungsten, tantalum and columbium, having an exterior exposed layer composed predominantly of an alloy or intermetallic compound of the selected metal and silicon, the alloy containing silicon in a molecular ratio to the refractory metal of from about 1:1 to about 3:1, the body being characterized by a high resistance to oxidation at temperatures above about 1000° C.

2,771,667
METHODS OF MAKING LUBRICATING SYSTEMS AND DEVICES
Stuart O. Sanden, Noroton Heights, Conn., assignor of forty percent to Peter Fries, Jr., New York, N. Y.
Original application March 1, 1949, Serial No. 78,943. Divided and this application September 26, 1950, Serial No. 186,893
2 Claims. (Cl. 29—420.5)

1. The process of making a porous flow retarding and regulating plug, comprising the steps of briquetting copper and tin oxide powders with silica and graphite, then heating the mixture, reducing the oxides to metal and interdiffusing the formed copper and tin to yield a strong bronze matrix with an excess of graphite, forming an



excess length of said porous metal of fluid flow retarding properties, breaking off said excess length to expose a rough and fibrous end surface, and breaking off an intermediate length of said remaining length to expose a second rough and fibrous end surface.

2,771,668
METHOD OF PREPARATION OF BAKING PANS FOR BREAD
Richard E. Lindsey, Redwood City, Calif.
Application August 19, 1953, Serial No. 375,195
1 Claim. (Cl. 29—423)

A method for providing a bread baking pan with a continuous but removable and replaceable internal coating which is repetitively non-adherent with respect to bread baked therein comprising applying to a flat web of metal having good heat conductor properties and sufficient thinness to be hand worked a polytetrafluoroethylene film 0.0003–0.009 inch thick, baking said film onto said web, deforming a portion of said web into a bread baking pan liner of slightly greater depth than a baking pan, inserting said liner into a baking pan, and removably securing said liner to said pan by manually turning down the top edge portions of said liner into clamping relation with the top edge portions of said pan.

2,771,669
METHOD OF COATING INTERIOR OF TUBING WITH ZINC
John W. Armstrong and Richard W. Spears, Rochester, and Richard D. Williams, Fairport, N. Y., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application July 7, 1952, Serial No. 297,552
8 Claims. (Cl. 29—429)

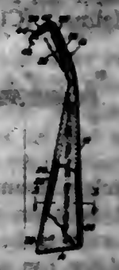
1. In the manufacture of steel tubing which is formed continuously from a flat steel strip by bending the strip into tubular form and welding the abutting edges of the tube as it is continuously moved past a welding device; the method of coating the interior surface of the tubing during its continuous formation and while it is being

moved continuously with a non-corrosive metal such as zinc which comprises the steps of introducing particles of said metal into the tubing before the tubing is fully formed and while it is below welding temperature, introducing a non-oxidizing gas into the tube after it is fully formed and welded, subsequently heating the tube sufficiently to vaporize the coating metal, and thereafter cooling the tubing to effect condensation of the vaporized metal on the surface of the tubing.

2,771,670
METHOD FOR FORMING A RAIL ANCHOR WITH A POSITIVE APPLYING STOP
Max K. Ruppert, Chicago, Ill., assignor, by mesne assignments, to Poor & Company, Chicago, Ill., a corporation of Delaware
Application March 31, 1950, Serial No. 153,164
1 Claim. (Cl. 29—550)

The method of forming a rail anchor of the one-piece hook-jaw type with stop shoulders on the curved inner surface of the hook portion of the anchor, the method including the steps of pressing a metal bar of T-shape cross-section between breakdown dies to partially bend one end of the bar into hook form, the bending pressure being applied exclusively to the lateral arms of the T-bar, and one of said dies being formed with an open recess extending transversely of the bar, applying metal displacing pressure to the lateral arms only of the T-bar at the bend of the partially formed hook immediately preceding the completion of the breakdown operation to force metal of the lateral arms into said recess to form a pair of longitudinally aligned shoulders on the inner face of said partially formed hook, thereafter clamping the bar on an anvil die having a recess to receive said longitudinally aligned shoulders, applying bending pressure exclusively to the lateral arms of the bar to bend the partially bent end portion thereof around the anvil die, to complete the formation of the hook, and applying pressure to the outer surface of said lateral arms at the location of said shoulders simultaneously with the completion of the hook forming operation so as to further press the shoulder portions into the last mentioned recess to remove any distortions formed in the shoulders as an incident to the normal stretching of the metal during the bending of the bar around said anvil die.

2,771,671
BLADE COLLECTOR
Nicholas Testi, New York, N. Y., assignor to The Gillette Company, Boston, Mass., a corporation of Delaware
Application March 2, 1953, Serial No. 339,635
11 Claims. (Cl. 30—40)

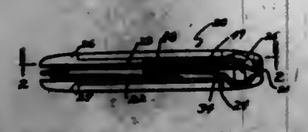


1. A blade collector comprising an elongated hollow body having a bottom which is unobstructed and curved upwardly in one portion, and a cover of sheet metal let into the bottom in substantially flush relation therewith and having a pair of thin spring prongs extending outwardly in tangential relation to the curved portion of the bottom and forming therewith a spring inlet gate for a blade, whereby a used blade may be engaged and guided into the hollow body of the collector by passing the collector in uninterrupted movement over the blade.

2,771,672
DRY SHAVER
Victor Kebler and Werner Kebler, Zurich, Switzerland
Application July 18, 1952, Serial No. 299,581
Claims priority, application Switzerland July 21, 1951
2 Claims. (Cl. 30—43)

1. In a power operated dry shaver, a shearhead having a movable cutter element, an electric motor for driving said element, means for drivingly connecting said motor with said movable element, a casing in which said motor and shearhead are mounted, said motor having a pair of relatively reciprocable contact carriers, an electrical contact on each of said carriers, screw means for adjusting said contacts relative to each other for setting the speed of operation of said motor, said screw adjustment means being mounted on one of said contact carriers, an abutment mounted in fixed relation to said casing and adjustable relative to said screw means for effecting further adjustment of said contacts for controlling the speed of operation of said motor within a certain range of speed, means for adjusting said abutment, said screw means being engageable upon said abutment.

2,771,673
RAZOR BLADE RELEASE MECHANISM
Travis H. Nash, Jonesboro, Ark.
Application January 12, 1955, Serial No. 481,435
5 Claims. (Cl. 30—64)



1. A razor blade release mechanism for attachment to a razor having a hollow elongated handle with an open front and a pivotal member for clamping a razor blade, said mechanism comprising a pivotal lever mounted in said handle and having a lower end projecting through the open front thereof for exerting finger pressure thereon, spring means urging the lower end of said lever outwardly, means on the upper end of said lever for engaging said pivotal blade clamping member for selectively clamping and releasing the razor blade upon pivotal movement of said lever.

2,771,674
CUTLERY DEVICE
John W. Hunt, Pontiac, Mich., and William A. Hunt, Chicago, Ill.; said William A. Hunt assignor to said John W. Hunt
Application June 12, 1953, Serial No. 361,366
4 Claims. (Cl. 30—142)

1. In a pocket cutlery device including a housing and a plurality of blades pivotally mounted in said housing

to swing out of said housing into operative position, the provision of a nail clipper mounted in said housing and comprising upper and lower flat spring members joined at one end and bent inwardly toward each other at the opposite ends to form cutting jaws, said lower member bent downwardly at a point inwardly from said jaw end and thence upwardly toward said jaw end to form a semicircular depression in said lower member, a pin passing upwardly through said depression and through said upper member, a head on said pin engaging the lower surface of said lower member, an operating arm pivotally affixed near its end to a slot near the upper end of said pin above said upper spring member so as to swing over the top of said pin and lie

back parallel to said upper member in an inoperative position, said nail clipper being pivotally mounted within said housing near the center thereof by a pin through the joined ends of said flat spring members so that said clipper may be swung out of said housing into an operative position, a recess in one end of said aforementioned housing to enclose the jaws of said clipper when the clipper is pivoted into said housing, and a recess in said housing to partially receive said operating arm of said clipper when said clipper is pivoted into said housing and said operating arm is in its inoperative position leaving a portion of said operating arm protruding from said housing to serve as a gripping means to pivot said clipper out of said housing toward the operating position of said clipper.

---

2,771,675
**RUBBER DENTAL CUSHION HAVING LUBRICANT COATING**
George H. Wills, Kansas City, Mo.
Application September 25, 1953, Serial No. 382,370
2 Claims. (Cl. 32—2)

1. As a unitary article of manufacture, a dental cushion for use as an insert between an artificial denture and the associated gum, said cushion comprising an elastic body of synthetic rubber for cushioning the denture as the same is forced toward the gum, said body of synthetic rubber being substantially impermeable to aqueous fluids and impermeable to wax, a reticular flexible fabric panel completely encased within said body and completely saturated and impregnated by said synthetic rubber, and a lubricating coating of wax completely covering the body for reducing injury to the gum from friction between the body and the gum, whereby the body maintains the lubricating coating separate from and out of contact with said flexible fabric panel.

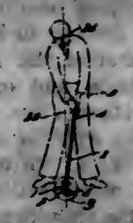
---

2,771,676
**MEANS FOR EXTRACTING TEETH**
Charles F. Tully, San Diego, Calif.
Application April 6, 1953, Serial No. 346,946
5 Claims. (Cl. 32—62)

1. A shearing tooth extractor means consisting of a concave tooth-engaging member and a bifurcated shearing member of greater length than said tooth engaging member pivotally connected therewith the bifurcated members being spaced apart a sufficient height and width to pass around the opposite sides of the tooth and arranged to cut the process on the labial side of the tooth

and pass along the side walls of the tooth separating the process from said tooth.

---

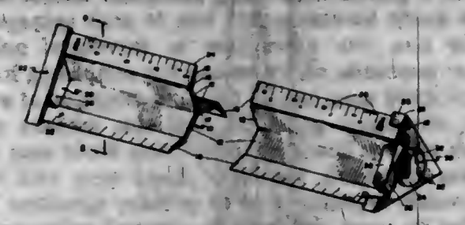


2,771,677
**DENTAL MATRIX DEVICE**
John J. Curry, Philadelphia, Pa.
Application March 9, 1953, Serial No. 341,185
22 Claims. (Cl. 32—63)

1. A dental matrix device comprising a flexible band member for being received about a tooth having first and second terminal portions, and a substantially V-shaped connecting element having first and second legs respectively secured lengthwise along the first and second terminal portions transversing said band member.

---

2,771,678
**GOLFING AIDS**
Fred C. Hansen, Sr., Detroit, Mich.
Application February 15, 1952, Serial No. 271,787
13 Claims. (Cl. 33—46)



1. An attachment for a golf club comprising, a clamp adapted to be secured to such golf club adjacent to the head thereof, said clamp including a sighting device which extends at the same angle with respect to the longitudinal axis of the shaft as does the line of sight between the user's sighting eye and the ball engaging portion of the striking face of the golf club head when the club head is positioned adjacent to and rearwardly of the ball to be hit with the longitudinal axis of the club shaft directed toward the user's body and the hands of the user grasping the club shaft in stroking position, and means for adjustably securing said clamp to said golf club.

---

2,771,679
**ENGINEER'S SCALE**
James E. Capp, San Diego, Calif.
Application March 30, 1956, Serial No. 575,162
4 Claims. (Cl. 33—107)

1. An engineer's scale comprising an elongated scale body of flexible and resilient material and comprising three symmetrically spaced, similar, coextensive blades radiating from the longitudinal axis of the body, said blades having substantially inflexible scaled faces constituting the elongated tip portions of the blades; triangular box-like end frames enclosing the ends of said body; and retainers secured to the ends of said body and retaining said end frames against movement longitudinally of said body; the extremities of said faces engaging the

corners of said end frames; the width of said blades measured radially of the body being slightly greater than the distance from the center of one of said end frames to a corner thereof; whereby said faces can be snapped into two alternate positions, and in each position being substantially parallel to the corresponding sides of the end frames.

---

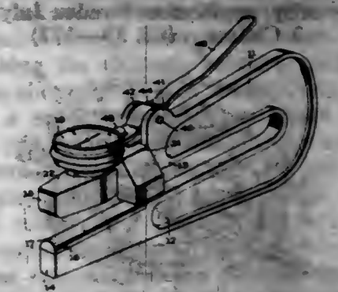
2,771,680
**NO-WIPE OIL DIP STICK**
George H. Lee, Oak Ridge, Tenn.
Application November 2, 1955, Serial No. 544,425
10 Claims. (Cl. 33—126.4)

1. An oil dip stick adapted to be inserted into an oil container through a well in the top thereof to measure the level of oil in said container comprising an elongated vertically extending member having, as its lower oil measuring portion, a pair of relatively movable legs having irregular cooperating surfaces, and means defining two possible relative positions of said legs, an open position and a closed position, in the open one of which positions the cooperating surfaces are slightly offset from one another to form a vertically extending series of oil retaining holes, and in the closed one of which positions the cooperating surfaces mate with one another to close up the said holes.

---

2,771,681
**MEASURING DISC WITH TOTAL INDICATOR**
Clarence G. Reinking, San Francisco, Calif.
Application March 31, 1953, Serial No. 345,924
5 Claims. (Cl. 33—141)

3. In a measuring device of the character described the combination of a disc having a reference point and distance measuring graduations about its periphery adapted upon being rolled over a surface to indicate distance covered in a single or partial revolution thereof, a second disc of smaller diameter disposed in parallel contacting relation with said first disc having an internal ring gear connection with said first disc, said smaller disc having graduations corresponding to multiples of the

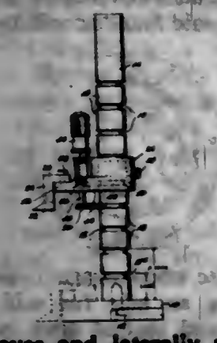


periphery of said first disc and being adapted and arranged to turn more than one revolution for each complete revolution of said first disc, whereby an indication of the total distance covered by a plurality of complete revolutions of said first disc will be directly readable

upon said second disc when adjacent said reference point, and means forming an axle for said second disc for securing said first and second discs in relative rotative relation adapted and arranged to be gripped between the thumb and forefinger of an operator at opposite sides of said discs when rolled over a surface.

---

2,771,682
**PRINTING PLATE GAUGE**
Joseph P. Dorr, Silver Spring, Md.
Application August 21, 1952, Serial No. 305,548
7 Claims. (Cl. 33—147)

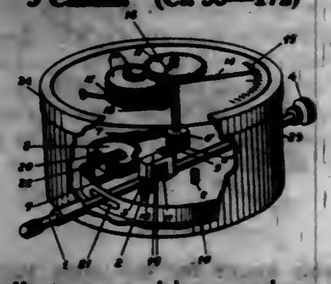


1. A portable gauge for indicating variations in the thickness of curved printing plates comprising a frame having a pair of fixed spaced substantially co-extensive arms, an abutment secured on the inner face at the end of one of said arms to engage the concave face of the printing plate, a thickness indicator carried by the other of said arms and having a plunger extending through said other arm and opposed to said abutment for contacting the convex surface of the printing plate, a clamping member slidably mounted on said other arm, means for guiding said clamping member relative to said other arm in a vertical direction toward and away from said abutment, a pair of transversely-spaced plate-engaging surfaces on said member cooperating with said abutment to orient the gauge in a plane extending radially of the printing plate, a spring normally urging said member in a direction to cause such surfaces to engage the convex surface of the printing plate, and a manually-operable lever for retracting said member to permit application of the gauge to the printing plate.

---

2,771,683
**PRECISION LAYOUT AND HEIGHT GAGE**
Robert F. Kirchhof, Broad Brook, Conn.
Application April 1, 1955, Serial No. 498,648
1 Claim. (Cl. 33—170)

A gage of the type described comprising a base, a shaft upstanding from the base, a plurality of evenly axially spaced grooves formed in the shaft, a sleeve slidably disposed on the shaft, a micrometer carried by the sleeve in spaced parallel relation to the shaft, means mounting the micrometer for axial adjustment, a work instrument carried by the sleeve and depending therefrom, means for securing the sleeve in selected positions on the shaft, a horizontally disposed rest plate having means to receive the micrometer and adapted to position

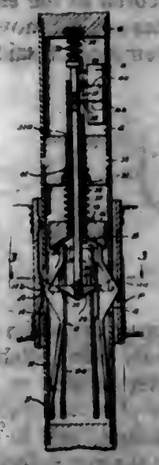


the sleeve on the shaft in accordance with the adjustment of the micrometer, said rest plate having means engageable with the grooves to selectively mount it on the

shaft in the grooves and laterally projecting from the shaft at the desired groove, said rest plate having a cut-out receivable in said grooves.

---

**2,771,684**
**IMPROVEMENTS IN MEASURING INSTRUMENTS**
Tage Alfred Strömberg and Karl Gustav Leonard Hansson, Stockholm, Sweden
Application December 18, 1952, Serial No. 326,674
Claims priority, application Sweden July 28, 1952
3 Claims. (Cl. 33—172)



1. A test indicator comprising a casing, pointer means, a rotatable drum, means connecting said pointer means to said drum to be driven thereby, a measuring rod, and a section of flexible metal band having one end thereof connected to the said measuring rod and the other end connected to said drum, a spring device keeping said section of metal band stretched, said spring device comprising a leaf spring having one end secured to said test indicator casing, a swingably mounted eccentric sheave carried at the other end of said spring, two sections of metal band secured at one end thereof to said sheave at approximately diametrically opposed points on said sheave at different distances from the axis thereof, the other end of said latter sections of metal band being secured to said drum and connected to said measuring rod respectively.

---

**2,771,685**
**INTERNAL PIPE CALIPERING TOOLS**
John C. Kinley, Houston, Tex.
Application June 12, 1952, Serial No. 294,653
3 Claims. (Cl. 33—178)

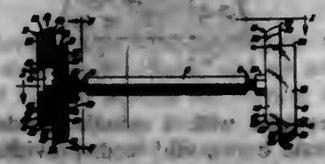
3. In a tool adapted to be placed into a pipe for calipering surface variations therein, a plurality of circumferentially spaced feelers supported for lateral movement into contact with the inside surface of the pipe, two contact members within said tool adapted to reciprocate relative to said feelers, one contact portion on each of said feelers adapted to engage one of said contact members with the feeler moved furthest outward controlling the extent of reciprocation of that contact member, and another contact portion on each of said feelers adapted to engage the other of said contact members with the feeler moved furthest inward controlling the extent of reciprocation of that other member, the two contact members having tapered surfaces in contact with the contact portions of the feelers, one of said contact members having a tubular rod thereon reciprocable therewith, the other of said contact members having a shaft thereon which

extends through the bore of said rod, a chart in said tool, and a stylus on said rod and another stylus on said shaft for making a record on said chart of the reciprocal movements of said rod and said shaft.

---

**2,771,686**
**INSTRUMENT TO MEASURE THE DIAMETER OF SUBSURFACE WELL BORES**
Hugh C. Hennessy, Fritz G. Mueller, and Frederick E. Armstrong, Bartlesville, Okla.
Application August 21, 1953, Serial No. 375,843
16 Claims. (Cl. 33—178)
(Granted under Title 35, U. S. Code (1952), sec. 266)

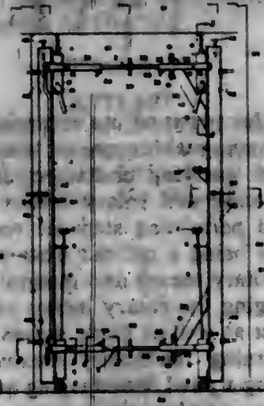
1. A well bore caliper comprising electrical indicating and control means adapted to be located at the surface of the ground near the mouth of a bore-hole, an elongated body member having a plurality of measuring arms adapted to be lowered into said bore-hole, a conductor cable connecting said body member to said surface equipment, means in said body member for selectively extending and retracting said measuring arms in response to electrical signals from said surface equipment through said conductor cable, a variable resistor in said body member for each of said measuring arms and responsive to the position thereof, and means for selectively connecting each of said variable resistors to said surface indicating means through said cable whereby the position of each of said measuring arms may be determined.



---

**2,771,687**
**BORE GAGE**
Marshon C. Hoste, Jr., Muskegon, Mich.
Application July 8, 1952, Serial No. 297,698
6 Claims. (Cl. 33—178)

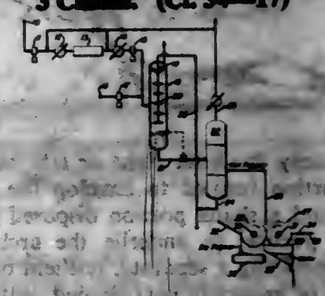
1. An adjustable bore gage having a major axis adapted to be brought toward concentricity with the axis of the bore in checking the diameter of the bore; comprising a



first elongated gage block having a rounding bore engaging face at one end generated about an axis extending lengthwise of said major and with the radius of generation not exceeding the minimum radius of the bore to be gaged, and said first gage block having a straight exterior side face extending lengthwise of the first gage block, a second elongated gage block having a rounding bore engaging face at one end generated about an axis extending lengthwise of said major axis and with the radius of generation not exceeding the minimum radius of the bore to be gaged, and said second gage block having a straight exterior side face extending lengthwise of said second gage block and mating with said straight side face of said first gage block to permit sliding of said gage blocks lenthwise relative to each other, a slideway and key connection between said mating faces of said gage blocks and constraining said gage blocks to so slide

lengthwise relative to each other, fastening means arranged to secure said gage blocks together in different positions of adjustment lengthwise of each other, and a fine adjustment for said positions of adjustment of said gage blocks, comprising a lateral extension projecting from said mating face of one of said gage blocks into the path of the other gage block, said lateral extension being provided with a threaded bore extending completely therethrough in a direction parallel with the direction of relative movement of said gage blocks, the end of said other gage block adjacent said lateral extension being also provided with a bore in line with and forming a continuation of said first bore, said bores being severally provided with oppositely pitched threads, and an adjusting screw having its opposite ends oppositely threaded and with said opposite ends respectively screwed into said bores.

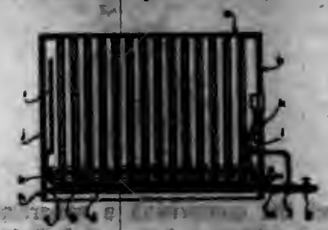
---



**2,771,688**
**DOOR FRAMING JIG**
Harold E. Baker, San Jose, Calif.
Application February 4, 1955, Serial No. 486,162
5 Claims. (Cl. 33—194)

1. A door framing jig comprising a pair of similar, elongated members, means for holding said members in spaced, parallel, opposed relationship, adjustable feet extending from the lower ends of said members and adapted to engage the floor for positioning said members vertically in a rough door opening, generally U-shaped elements extending from the upper ends of said members and mounted for reciprocation therefrom, and means for yieldably urging the upper arms of said elements into engagement with the header of said rough opening, and adjustable means mounted at the upper ends of said members for supporting a head jamb of a door frame whereby when said jig is so positioned in said rough opening the outer edges of said members and said adjustable means serve as accurate guides for the placement of the jambs of said door frame.

---



**2,771,689**
**REMOVAL OF WATER FROM SOLID POLYMERS**
Richard S. Bottz, Jr., Park Forest, Ill., assignor to Standard Oil Company, Chicago, Ill., a corporation of Indiana
Application March 26, 1953, Serial No. 344,726
3 Claims. (Cl. 34—17)

1. The process of removing physically bound water from a solid, water-laden, hydrocarbon polymer which comprises passing said water-laden polymer between two smooth counter-rotating, horizontally disposed parallel rolls, maintaining the distance between said rolls from about 0.001 to about 0.010 inch, maintaining one of said rolls cool, at a temperature between about 35° F. and about 80° F., and maintaining the other of said rolls hot, at a temperature between about 150° F., and about 225° F. whereby water is transferred from the thin polymer layer to the cool roll and the thin polymer layer adheres to the hot roll, continuously removing liquid water which is separated from said water-laden polymer from the surface of said cool roll after said water passes between said rolls and before said water can recontact polymer, and continuously removing substantially dewatered polymer from the surface of said hot roll after said polymer passes between said rolls and before said dewatered polymer can recontact water-laden polymer.

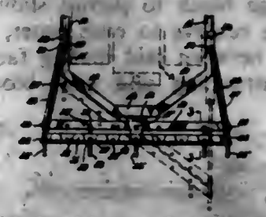
**2,771,690**
**LINEN DRIER**
Henri Jean Frederic Jeanne, Toulouse, France
Application August 7, 1953, Serial No. 372,856
Claims priority, application France August 27, 1952
13 Claims. (Cl. 34—48)

12. A linen drier adapted to operate at high speed, comprising a plate of heat conducting material having its ends extending downwardly from its medial portion to form a hood having open sides and an outer convex surface on which articles to be dried are adapted to be laid, means closing the open sides of the hood, a steam boiler in said hood, a plurality of tubes connected to said boiler and having heat exchange contact with the inner surface of said plate, means for heating said boiler with gaseous combustion products, and means for passing the gaseous combustion products after contacting said boiler into direct heat exchange contact with the inner surface of said plate.

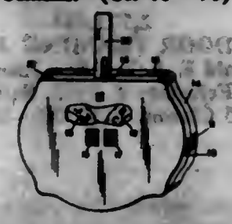
2,771,691
**CUSHIONED FOOT PROTECTOR**
Morton G. Lachs, New York, N. Y., assignor to J. W. Landenberger & Co., Philadelphia, Pa., a corporation of Pennsylvania
Application September 22, 1954, Serial No. 457,651
1 Claim. (Cl. 36—10)

Knitted hosiery for both right or left feet, comprising a forward portion formed to envelop the toes and ball of the foot, and a shank portion disposed rearwardly of said forward portion to underlie the arch of the foot, said hosiery including a separate, resilient pad of uniform thickness and of generally pear-shaped outline symmetric about its longitudinal axis, said pad being placed and secured interiorly of said hosiery in said forward portion with said longitudinal axis of said pad longitudinally disposed therein, and with its greatest transverse axis disposed to underlie the ball region of the foot, said pad being of sufficient width and area to support the pressure points of the bottom of the foot in the ball region thereof over a substantial range of widths of feet and terminating at its forward edge substantially at a line defined by the forward edge of said ball region, at its rearward edge in the forward region of the arch, and along its side edges short of the sides of the foot, said pad having an exposed, flat, uninterrupted surface to provide a smooth cushioning member for directly supporting the ball region of the foot, the generally pear-shaped outline of said pad, its symmetry about its longitudinal axis, and the mounting of said pad interiorly of the hosiery with its longitudinal axis longitudinally disposed within said hosiery adapting the hosiery for use on right or left feet without reversal of the hosiery.



2,771,692
**HEEL PIECE, PARTICULARLY OF HARD RUBBER WITH CELLULOID COATING**
Friedrich Silbbe, Viedio (Weser), Germany
Application November 23, 1953, Serial No. 393,870
6 Claims. (Cl. 36—35)

1. A heel lift comprising a spherically curved base body of hard rubber, a layer of Celluloid on the upper face of the body, and a thin layer of soft, non-brittle material on the Celluloid layer.

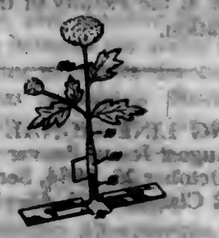


2,771,693
**LAND CLEARING IMPLEMENT**
Charles S. Bourque, St. Gedeon de Beauce, Quebec, Canada
Application June 8, 1955, Serial No. 514,054
3 Claims. (Cl. 37—2)

1. An implement for attachment to a tractor comprising a rigid frame mounted in front of said tractor said rigid frame consisting of two legs extending on each side of said tractor and pivotally connected to said tractor at their rear ends, and of a cross leg consisting of two inclined portions extending from the forward ends of said legs and of a transverse middle portion connecting said two inclined portions, a pusher plate provided with top and bottom longitudinally extending flanges, each flange provided with a plurality of spaced bores, the bores of said top and bottom flanges being vertically aligned in pairs and a transverse bar horizontally spaced and pivotally mounted on said transverse middle portion for horizontal movement, a plurality of ground engaging teeth having a substantially triangular shape and being in sliding contact with the bottom flange of said pusher plate, each of

said teeth provided with a spindle pivotally journalled in a pair of said bores, said teeth provided with a rearward extension pivotally connected to said transverse bar, and means to pivot said pusher plate and said transverse bar from a position transversely of said tractor to a position inclined relatively thereto on either side of said tractor consisting in an upper and lower actuating rods secured to the spindle of the end teeth and to the pivotal connection of said end teeth to the rear transverse bar respectively, and in a sleeve slidably mounted on the legs of said frame and to which the rear end of said actuating rods are pivotally connected.

2,771,694
**BOXES, CASES AND CONTAINERS FOR PERSONAL USE**
George Stratton Langston, Birmingham, England
Application October 9, 1953, Serial No. 385,236
Claims priority, application Great Britain August 21, 1953
5 Claims. (Cl. 46—70)



1. Container for personal use comprising main component parts and having within one of them a rotary means of circular form carrying characters such as letters, a means for mounting said rotary means within the component part and permitting stepwise rotation of it, said mounting means being a cut out plate providing bearing means for the rotary means and integral with the plate a means for engaging the rotary means and retaining it in a position of rest as well as guide means for an operating member for turning the rotary means, said operating member including a pawl for engaging any one of a series of notches in the circular rotary means and also including a limb which co-operates with the guide means and forms a stop limiting the movement of the operating member.

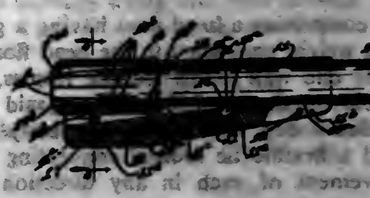
2,771,695
**ORNAMENT HOLDER FOR DECORATIVE PACKAGE BOWS**
Bill Y. Jensen, Bellaire, Ohio.
Application April 12, 1954, Serial No. 422,347
1 Claim. (Cl. 41—10)

A decoration for packages having tying tapes, said decoration comprising in combination an ornamental

floral spray including a stem having artificial foliage and an artificial flower; a support including a pair of elongated flat plates spaced apart with their longitudinal axes in alignment and adapted for disposition between the package and the tapes thereof; and an L-shaped bendable wire element for each plate respectively, each element having a horizontal and a vertical leg, the horizontal legs being secured rigidly to the uppermost faces of corresponding

plates on said longitudinal axes thereof, the vertical legs embracing the stem therebetween; and an adhesive tape wrapping coiled spirally around the vertical legs and the stem for attaching the spray to the support, the plates extending radially in opposite directions from a line extending downwardly beyond the longitudinal vertical axis of the stem, the horizontal legs extending beyond the proximal spaced apart ends of the plates and merging with the vertical legs adjacent said extended axis.

2,771,696
**EJECTOR FOR POWDER-ACTUATED TOOLS**
Rowland J. Kopf, Rocky River, and Roger Marsh, Hudson, Ohio, assignors to Portable Industries, Inc., Cleveland, Ohio, a corporation of Ohio
Application April 23, 1954, Serial No. 425,195
11 Claims. (Cl. 42—1)

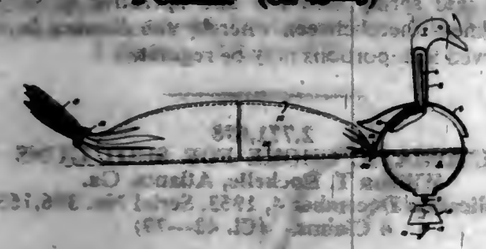


1. In powder-actuated apparatus of the type utilizing a breech plug, a cartridge-ejecting device comprising an ejecting pin mounted at one end, and an annular resilient cleaning element mounted in surrounding relationship with said pin adjacent its free end.

2,771,697
**REMOVABLE HANDGRIP FOR GUNS**
Harry A. Reising, La Grange, Ill.
Application August 10, 1953, Serial No. 373,132
2 Claims. (Cl. 42—71)

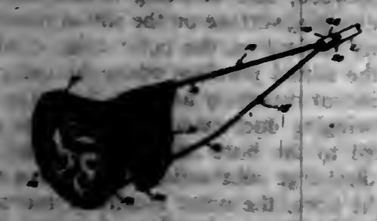
1. A handgrip adapted to be removably secured to the forearm or the like of a gun, said handgrip comprising a resilient Y-shaped body including a handle portion and curved arm portions, said body being formed by a pair of longitudinally extending half portions in face-to-face relation, each of said halves having a pair of longitudinal channels spaced one from the other and each extending from the handle portion to one of each of the arm portions of said halves, said channels forming a pair of grooves extending from said handle portion to each of said arm portions when said halves are in face-to-face relation, a pair of opposed spring members each positioned in one of said grooves, and adjusting means connecting said spring members and operative to vary the displacement therebetween whereby the distance between said curved arm portions may be regulated.

2,771,698
**AUTOMATIC CHOKE FOR SHOT GUNS**
William T. Rochelle, Atlanta, Ga.
Application December 4, 1953, Serial No. 396,155
4 Claims. (Cl. 42—79)



1. An automatic choke for gun barrels comprising a bore member having a bore, means for securing the bore member to the barrel of a gun with the bore in axial alignment with the gun bore, the bore member having slits at the outer end of the bore, an outer cylindrical member having a gas-impinging surface and surrounding the slitted portion of the bore member and coacting means therebetween, said coacting means comprising a forwardly converging surface on the slitted member and a ring contacting surface on the outer cylindrical member to constrict the slitted portions when the outer cylindrical member moves rotatively and axially in the rearward direction, a swinging duct member having one end of its duct connected to the bore and its other end having a direction of discharge substantially in a plane normal to the axis of the bore, the outer rotatively movable cylindrical member having a plurality of spaced abutments providing gas-impinging surfaces in position to register with and receive impulses successively from the gas discharged from the duct to revolve the outer cylinder by increments as the gun is successively discharged.

2,771,699
**QUICK DETACHABLE GUN SLING SWIVEL**
George L. Hartey, Waseca, Minn.
Application August 24, 1953, Serial No. 376,211
7 Claims. (Cl. 42—85)

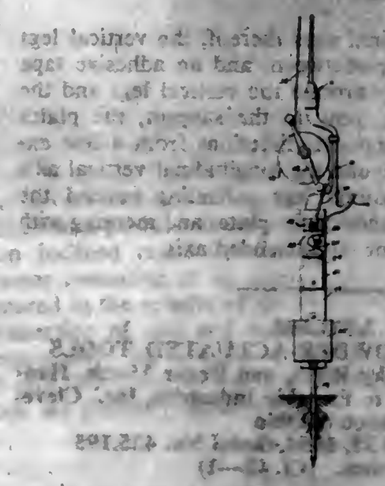


2. A tubular base having an internal annular lock channel applicable to a part of a firearm, a cylindrical swivel insertable into the base and having means for attaching a gun sling thereto, at least one depending arm pivoted relative to the swivel for swinging movement in the plane of the swivel, said arm having an outwardly projecting lock lug, a spring urging the arm outwardly to project its lock lug into the lock channel to detachably attach the swivel to the base, a turnable plunger in the swivel having a limited relative axial movement, said arm at its free end portion and said plunger having at its inner end portion contacting means operable when the plunger is pushed inwardly to operate the arm and withdraw its lock lug from the lock channel.

2,771,700
DECOY
Charles S. Rosevelt, Jr., Richmond, Calif.
Application June 15, 1954, Serial No. 436,783
2 Claims. (Cl. 43—3)

1. A decoy comprising a head float having a generally upright stem, a weight connected to the head float to immerse its lower end well below surface ripples, a head loosely rotatable on the head float about said stem, a waterproof inflated bag constituting the body float of the decoy, and a flexible tie loosely connecting the two floats for movement of each in any direction relative to the other.

2,771,701
FROG NET
George C. Harper and Carl T. Wilson, Shreveport, La.
Application September 8, 1954, Serial No. 454,887
2 Claims. (Cl. 43—7)



1. A frog net, comprising an elongated handle, supporting arms, bag supporting ring and flexible bag, the supporting arms extending outwardly and diverging from the end of the handle, the ring being attached to the ends of the arms in a plane transverse to the axis of the handle, and the bag being elongated and having an open end attached around the periphery of the ring.

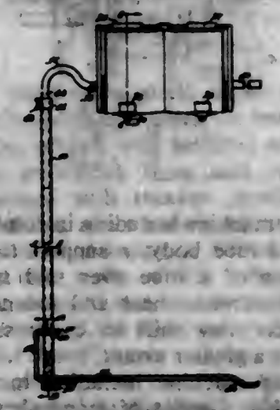
2,771,702
FISHING TRAWLS
Agnar Gudmundsson Breidfjord, Reykjavik, Iceland
Application August 9, 1952, Serial No. 303,518
4 Claims. (Cl. 43—9)

1. A floating trawl for use in sea fishing comprising a trawl net of elongated configuration having a mouth opening of generally rectangular shape so as to present upper and lower substantially horizontal edges, a pair of main trawl wires connected at one end directly one to each of the two lower corners of the net mouth, and adapted to be connected at their opposite end to a single trawling vessel, a pair of auxiliary trawl wires connected at one end one to each of the upper corners of the net mouth, and connected at their other end one to each of the main trawl wires at a position intermediate the ends of said main trawl wires, and a trawl board disposed in each of the main trawl wires at a position intermediate the connection of the auxiliary wires thereto and the net mouth and disposed nearer the latter than to the position at which the main wires are connected to the auxiliary wires, said trawl boards being spaced away from the net mouth by a substantial distance, namely, approximately half the overall length of the elongated trawl net, said trawl boards constituting the sole means for applying through the main trawl wires the required downward and outward force to the lower edges of the net mouth to keep the same open without at the same time being sufficiently close to the net as to be calculated to scare away fish in the vicinity of the net mouth during the trawling operation.

2,771,703
FISHING LINE SIGNAL DEVICE
Edgar August Jonas, Beaver Dam, Wis.
Application October 22, 1954, Serial No. 463,980
2 Claims. (Cl. 43—17)

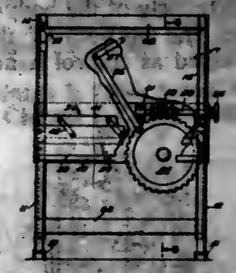
1. An alarm device for use with a fishing rod of the type having a handle and a rotatable reel provided with a crank located adjacent said handle, said alarm device comprising a tubular socket member arranged to telescopically receive said handle therein, means at one end portion of said socket member formed and arranged to lockingly interengage with a portion of the handle to prevent rotation of said handle in said socket, a ground-engaging stake element rigidly secured to one end of said socket member alarm element, a toggle switch mounted on said socket member, and electrically connected to said alarm element, an arm pivotally mounted to said socket member, and means operatively connecting one end of said arm to said toggle switch, said means being so positioned as to be operatively engaged by said crank as the reel rotates.

2,771,704
FISHHOOK GUARD
Glenn L. Biggs, Fayetteville, N. Y.
Application July 9, 1954, Serial No. 442,405
1 Claim. (Cl. 43—54.5)



A guard for use with a single gang type fishhook comprising a relatively small, flat circular member of penetrable material in which the points of the hook may be embedded, said member being formed with a small circular hole through the center thereof adapted to receive the shank of the fishhook when the points are embedded in the member, with a relatively close fit with the shank portion of said fishhook, said member being formed with a plurality of larger circular holes arranged in uniformly spaced relationship on a circular path concentric with said center hole, the points of the fishhook being normally

embedded in said member in the portion thereof between adjacent pairs of said larger holes, said center hole acting as a bearing and a guide for the shank of the fishhook to prevent the points thereof from extending beyond the peripheral edge of the member and to locate them in the concentric path of said larger holes, said larger holes being sufficiently large to enable the points of gang hooks of various sizes to pass therethrough when the points are disengaged from the member and rotated into alignment with the holes, said member being formed with a radial slit extending between the center hole and each of the larger outer holes to enable the curved portions of the fishhook to pass completely through the member when withdrawing the hook from the guard.



2,771,705
BOOK CADDY
Charles Rettinger, Albuquerque, N. Mex.
Application February 23, 1955, Serial No. 489,959
3 Claims. (Cl. 45—82)

1. In a stand for supporting a book in a position for reading, the combination which comprises a telescoping post, a supporting base mounted on the lower end of the post for supporting the post in an upright position, a horizontally disposed arm having a vertically disposed shank positioned with the shank extended into the upper end of the post, means for clamping the shank of the horizontally disposed arm in adjusted positions in the post, a horizontally disposed support bar pivotally mounted on the horizontally disposed arm, vertically positioned plates having extended flanges on lower ends thereof positioned adjacent the ends of the support bar, links pivotally mounted, at one of the ends thereof, in said support bar and pivotally connected, at opposite ends thereof, to said book retaining racks, book retaining clamps mounted to slide vertically on said book retaining racks and adapted to secure backs of books to said racks, page retaining clamps slidably mounted on the flanges at the lower ends of the racks, tubes carried by lower ends of said racks and springs in the tubes positioned with one of the ends thereof connected to the tubes and the other to said page retaining clamps whereby tension is applied to the clamps for retaining pages of a book positioned on the racks in extended positions.

2,771,706
DRAFTING BOARD
Henry Elmer Johnson, San Leandro, Calif.
Application September 30, 1952, Serial No. 312,263
2 Claims. (Cl. 45—129)

1. An improved drafting machine comprising a pair of rails, support means connected to said rails and maintaining same parallel in vertical position, a vertically disposed drafting board carriage extending between said rails in slidable relation thereto and adapted to carry drafting, a worm gear, means rotatably mounting said worm gear upon one of said rails, a gear wheel rotatably mounted in engagement with said worm gear, an arm pivotally secured at one end to said gear wheel adjacent the edge thereof, and a link rigidly secured to the other end of said arm and pivotally mounted upon said carriage

whereby rotation of worm gear turns said gear wheel to slide said carriage along said rails through said eccentric.

2,771,707
TOY BANK
Herbert Ginsberg, Bayside, N. Y.
Application February 12, 1954, Serial No. 409,895
2 Claims. (Cl. 46—4)

1. An article of the kind described comprising a rectangular-shaped hollow container having front, rear, top, bottom and side walls, said top and front walls terminating short of each other providing an opening therebetween, said side walls having cutaway portions at their top ends communicating with said opening, a hollow cylindrical bearing member mounted on the top wall at the center thereof, said bearing member having lateral slots communicating with the interior thereof, a substantially vertically disposed trapezoidal-shaped gameboard rockably mounted in said opening and cutaway portions and extending above the container, a forwardly extending flange around the periphery of said gameboard, the bottom end of said gameboard being of arcuate shape and being seated on the top ends of the side walls, the portion of the flange along the top of the gameboard having a central opening adapted to receive a coin, a series of vertically spaced baffles on the front of said gameboard extending outwardly therefrom with spaces on the gameboard on both sides of the baffles between the ends of the baffles and the adjacent flanged portions of the gameboard, the lowermost baffle having central slots therein, and a hollow cylindrical handle secured to the gameboard below the lowermost baffle for rocking said gameboard, said handle being open at both ends and having a transverse cutout registering with the slots in the lowermost baffle for receiving a coin dropped through the opening in the top portion of the flange and cascaded onto the lowermost baffle, a cylindrical shaft extending from the rear of the gameboard adjacent its bottom and disposed loosely in said bearing member, and a flat spring carried by said shaft with the free ends thereof extending laterally of the shaft and through the lateral slots in the bearing member whereby to resiliently limit the rocking motion of said gameboard.

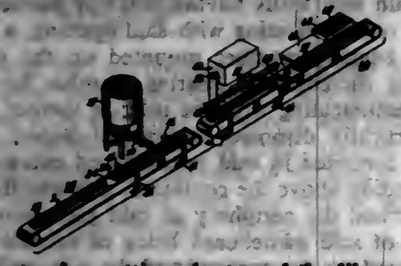
2,771,708
VENTRILOQUIST'S DOLL
Marian Bakuss, New York, N. Y.
Application October 26, 1953, Serial No. 388,814
6 Claims. (Cl. 46—154)

1. A ventriloquist's doll comprising a body, arms and legs pivoted upon said body, said arms and legs all

being formed from lengths of wire material having inner end portions disposed within the body and outer end portions projecting exteriorly of the body to define the limbs thereof, the inner end portions of the lengths of wire material being shaped as control handles adapted to be

engaged by the fingers of a hand inserted within the body, and means for automatically effecting joint movement of the arms including a U-shaped bail connected at its ends to said handles constituting the inner ends of said arms and depending within the body with its bight adapted for engagement by the finger of a user.

---



2,771,709

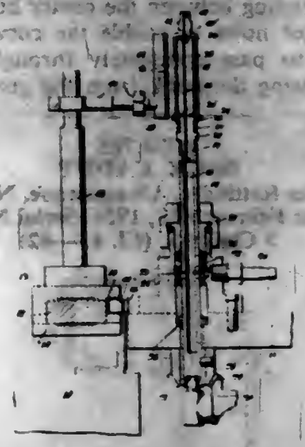
**PLANTING AND EQUIPMENT THEREFOR**

Alexander S. Ritter, Brielle, N. J.

Application April 9, 1954, Serial No. 422,199

5 Claims. (Cl. 47—1)

1. Apparatus for potting plants and the like comprising in combination a plant pot carrier of the type for handling a plurality of plant pots having a body and a collar, said collar being at the upper edge of the body of said pot, said collar extending beyond the body of said pot, said carrier comprising in combination a rigid rectangular frame, said frame particularly characterized in that the smaller dimension of the inside of said frame is substantially equal to a horizontal dimension of the body of said plant pot under the collar of the plant pot but less than the corresponding dimension of the collar on said plant pots, the longer dimension of the inside of said rectangular frame being slightly less than a multiple of the horizontal dimension of the collar of said pot perpendicular to said horizontal dimension of said plant pot whereby a plurality of said plant pots will rest snugly in line in said carrier; said rectangular frame having a height less than the height under the collar of said pot, and said frame having a support member across the narrow dimension of the frame and at substantially the center of the frame at its lower edge to prevent spreading of said frame; and wherein said support member is located between the location of two of said pots when said carrier is filled with said pots, means for filling said pots with soil, means for compressing said soil, means for moving said carriers continuously under said means for filling said pots with soil and means for intermittently moving said carriers under said soil compressing means.



2,771,710

**GLASS SYRINGE BARREL FORMING METHOD AND MACHINE**

Henry G. Mallucci, Rutherford, and Julius V. Magnah, Woodridge, N. J., assignors to Becton, Dickinson and Company, Rutherford, N. J., a corporation of New Jersey

Continuation of application Serial No. 150,926, March 21, 1950. This application February 18, 1953, Serial No. 337,525

24 Claims. (Cl. 49—7)

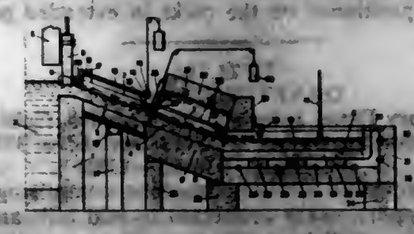
1. A forming machine including in combination a mandrel to receive a tube body, a support to limit the telescopic disposition of a tube over said mandrel, means exposing the mandrel to heat and means whereby said supporting means may shift to cause said mandrel to enter said tube to a greater extent.

11. A forming machine including in combination a rotatable turntable, a series of mandrels each to receive a tube, a carriage, tube and mandrel-heating means supported by said carriage at points adjacent said mandrels, means for coupling said carriage to move with said turntable and means periodically disconnecting said carriage from said turntable.

16. A machine to form a barrel having one open end and an opposite end closed except for a bored tip, said machine including a movable mandrel to extend through the open end of the barrel, means for pre-heating a thus supported barrel, a separate heating means for closing the tip of the same and final heating means for causing said barrel to conform to the surfaces of said mandrel.

---

2,771,711



**APPARATUS FOR CONDITIONING GLASS WHICH IS TO BE CONTINUOUSLY DRAWN INTO SHEETS**

Bernard Long, Paris, France, assignor to Compagnies Reunies des Glaces & Verres Speciaux du Nord de la France, Paris, France, a corporation of France

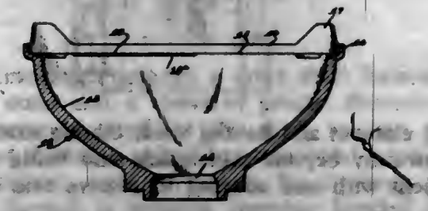
Application August 1, 1955, Serial No. 525,729

Claims priority, application France August 27, 1954

13 Claims. (Cl. 49—55)

1. Apparatus for conditioning fined molten glass just leaving the end of the fining zone of the tank furnace immediately before it enters into the receptacle from which it is to be drawn into sheets, said apparatus comprising an inclined canal leading downwardly from said tank furnace to said drawing receptacle, said canal having a first portion provided with means for cooling the glass therein primarily by radiation and an enclosed second portion provided with means for convectively cooling said glass, the floor of the first portion of said canal being relatively thin so as to bring about an important heat loss therethrough, and the floor of the second portion of said canal being relatively thick so as to reduce heat loss therethrough.

---



2,771,712

**CENTRIFUGAL MOLDS AND METHOD**

Clifford J. Reynolds, Sylvania, Ohio, assignor to Owens-Illinois Glass Company, a corporation of Ohio

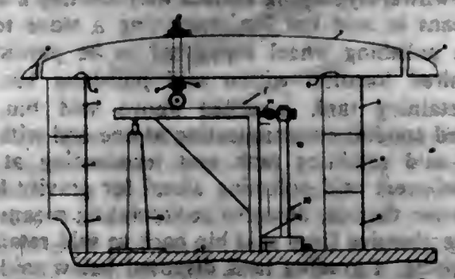
Application July 13, 1953, Serial No. 368,107

9 Claims. (Cl. 49—65)

1. A hollow mold open at its upper end and having upwardly flared inner wall surfaces, the mold being formed at the upper edge of said wall surfaces with a peripheral ledge extending outwardly from said upper edge, said ledge being formed with recesses providing means to facilitate the molding of an article within the mold.

6. The method of forming a hollow article having upwardly flared side walls, which comprises entering a charge of plastic material into an open ended mold having side walls flared toward the open end of the mold, rapidly rotating the mold about its axis and thereby spreading and molding said material over the side walls of the mold, anchoring the material to the mold adjacent to the rim thereof and thereby maintaining the material in contact with the mold during deceleration of the mold, decelerating the mold and hardening the said material.

---



2,771,713

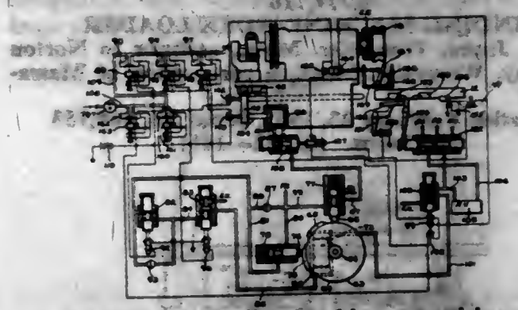
**APPARATUS FOR AND METHOD OF FORMING A TRUE SURFACE ARTICLE**

Samuel Charles Pechett, Toronto, Ontario, Canada

Application September 13, 1954, Serial No. 455,453

11 Claims. (Cl. 51—43)

1. The method of forming a true surface article to have at least two true surfaces, comprising erecting said article on a true surface with one surface of the article substantially parallel to said supporting true surface, grinding said substantially parallel article surface with an interrupted grinding action carried out precisely parallel to said supporting surface to reduce the article surface into a reference true surface precisely parallel to said supporting true surface, re-erecting said article to locate said reference true surface in precise relationship to said supporting true surface to bring a second surface of said article into a position substantially parallel to said supporting true surface, and grinding said second surface with said interrupted cutting action to reduce said second surface into a true surface precisely parallel to said supporting true surface and having a precisely accurate relationship to said reference surface.



2,771,714

**INTERNAL GRINDING MACHINE**

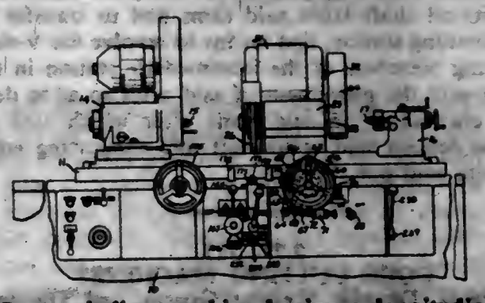
William D. Schmidt, Holden, and Harold L. Blood, Worcester, Mass., assignors, by mesne assignments, to The Heald Machine Company, a corporation of Delaware

Application March 9, 1954, Serial No. 415,648

18 Claims. (Cl. 51—48)

1. An internal grinding machine comprising a rotatable wheel, a means for holding a workpiece having a bore to be finished by the wheel, a pneumatic gage plug, means for introducing the plug into the bore in the workpiece when the wheel is at least partially withdrawn therefrom, power means for feeding the wheel and workpiece into cutting engagement, control means including a source of air under pressure responsive to the escape of said pressure air through the space between the plug and the bore of the workpiece connected to the power means to bring about changes in the actuation of the said power means when the bore reaches predetermined sizes, means including a valve actuatable upon the introduction and removal of the plug from the bore for limiting the amount of fluctuation of the effect of the said escape of air when the plug is removed from the workpiece, and means responsive to said gage plug for discarding workpieces whose bores are excessively tapered.

---



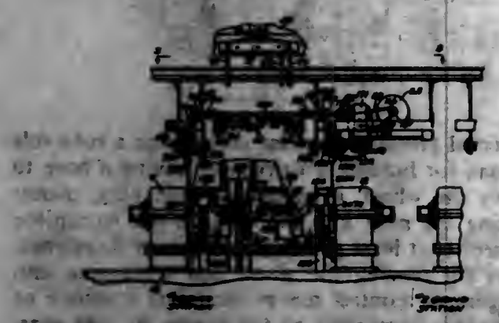
2,771,715

**GRINDING MACHINE**

Wallace H. Wood, Worcester, Mass., assignor to Norton Company, Worcester, Mass., a corporation of Massachusetts

Application November 6, 1953, Serial No. 390,631

6 Claims. (Cl. 51—95)



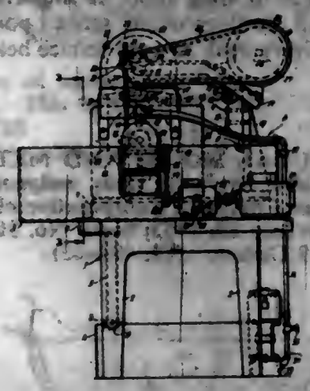
1. In a grinding machine having a longitudinally reciprocable table, a piston and cylinder to reciprocate said table, a reversing valve operatively connected to control the flow of fluid to and from said cylinder, a transversely movable wheel slide, a rotatable grinding wheel on said slide, a wheel feeding mechanism for said slide including a nut and feed screw to feed said slide in either direction, a manually operable feed wheel to rotate said feed screw, an adjustable stop abutment on said feed wheel, an oscillatable feed pawl operatively connected to actuate said feed wheel, an adjustable stop to limit movement of the pawl in one direction to facilitate adjusting the extent of the infeed, a fluid motor operatively connected to actuate said pawl, a control valve for said fluid motor, operative connections between said control valve and the table reversing valve whereby the control valve is actuated by and in timed relation with the table reversing valve so as

to impart an infeeding movement to the grinding wheel during reversal, and means including an independent stop pawl arranged to be engaged by said stop abutment positively to limit rotation of the feed wheel so as to stop the infeeding movement of the grinding wheel.

## 2,771,716
## GRINDING MACHINE-WORK LOADER

Glover C. Joyce, Worcester, Mass., assignor to Norton Company, Worcester, Mass., a corporation of Massachusetts

Application February 23, 1955, Serial No. 489,958
12 Claims. (Cl. 51—165)



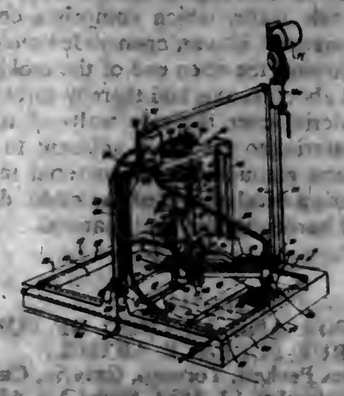
1. In a crankshaft grinding machine having a base, a transversely movable rotatable grinding wheel thereon, a pair of spaced axially aligned rotatable pot chucks for supporting the opposite ends of a crankshaft to be ground, means synchronously to rotate said pot chucks a work loading and a work unloading station, and a work loading and transferring mechanism therefor including an intermediate loading station located above the pot chucks having spaced revolvable V-shaped supporting members for supporting opposite ends of a crankshaft, a longitudinally movable work loader unit including a pair of spaced work engaging hooks which are movable through a substantially U-shaped path to facilitate picking-up a crankshaft to be ground from the loading station and depositing it in the intermediate station, means including a pair of spaced pivotally mounted work loader arms to pick up a ground crankshaft from the pot chucks and swing it into axial alignment with the intermediate station, said work engaging hooks being arranged to pick up a ground shaft from said arms and to transfer it to said unloading station, and means to revolve the V-shaped supporting members of the intermediate station in timed relation with the movement of said arms so as to deposit a new crankshaft on said arms after which said arms swing to deposit said crankshaft into supporting engagement with said pot chucks.

## 2,771,717
## CORE CUTTING MACHINES

Clarence G. Dunbe, Webster Groves, and Thomas W. Billington, Jennings, Mo., assignors to Maloney Electric Company, St. Louis, Mo., a corporation of Delaware

Application March 12, 1953, Serial No. 341,852
9 Claims. (Cl. 51—106)

1. A cutting machine comprising a supporting frame, a rotary member, a shaft on which said rotary member is supported for rotary movement, means for subjecting said rotary member to slow rotary movement, means, supported by said rotary member, for clamping to said rotary member articles to be cut by the machine, a cutting element, into cutting relation with which said articles are moved by said rotary member, and means for subjecting said cutting element to movement, said clamping means comprising a mechanism which includes an angular shaped fixed member and a pivotally movable jaw between which said articles are disposed, and spring means for drawing said movable jaw into clamping engagement with respect to said article, said fixed member and said movable jaw being disposed generally transversely of the



cutting element and having voids therein extending radially inwardly beyond said article and being disposed in alignment with and adapted to receive said cutting element.

## 2,771,718
## STONE POLISHING MACHINE

Aron Gustafson and Burnie E. Geno, Barre, Vt.

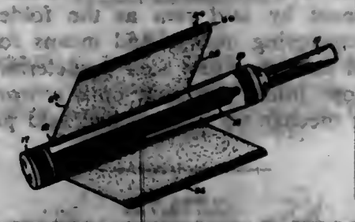
Application February 16, 1952, Serial No. 271,928
5 Claims. (Cl. 51—126)

1. A polishing apparatus comprising a polishing bin having a downwardly sloping bottom wall defining a drain trough, means in said bin for supporting a stone to be polished, a polishing wheel supported to be positioned at any desired location within said polishing bin, an abrasive retaining tank mounted above said bin, an abrasive feed conduit communicating at one end with the bottom of said retaining tank and terminating at the other end adjacent said polishing wheel for gravity feeding of abrasive thereto, abrasive recirculating means for recirculating abrasive from said bin back to said retaining tank comprising, a grading tank disposed below said bin and communicating with said trough to receive a stream of abrasive sludge therefrom, sprinkler means in said bin for washing the abrasive sludge therefrom into said grading tank, pump means for withdrawing abrasive from said grading tank and for delivering the abrasive to the top of said retaining tank, a perforated conduit disposed around the bottom of the retaining tank, conduit means for feeding a controlled amount of water through said perforated conduit to flow upwardly in said retaining tank to agitate and maintain the abrasive in suspension therein, an overflow conduit communicating with the abrasive tank above the bottom thereof and discharging into said bin to convey the excess water and the very fine particles of abrasive and stone to said bin, and a waste conduit communicating with said grading tank for conveying therefrom the excess water and the very fine particles of abrasive and stone.

## 2,771,719
## CRANKSHAFT GRINDING DEVICE WHEEL MOUNT

Elmer A. Fuglie, Winona, Minn., assignor to Winona Tool Manufacturing Company, Winona, Minn., a partnership

Application January 10, 1955, Serial No. 480,869
3 Claims. (Cl. 51—168)

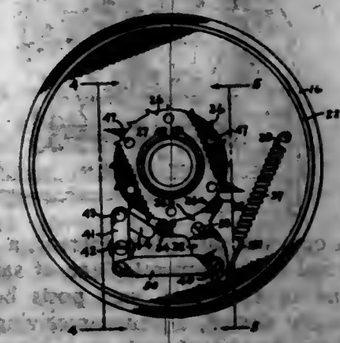


2. In a crankshaft grinder, a drive shaft formed with a threaded outer end, a sleeve of greater diameter than the shaft securely fitted on the shaft in rear of the threaded end thereof, a cylindrical bonded abrasive grinding stone formed with a relatively broad recess in one axial end thereof, a securing member bonded to the stone within said recess, said member containing an axial opening extending inwardly within the interior of the stone, the inner portion of said opening laterally threaded to receive the threaded end of the drive shaft, the outer portion of said opening formed as a smooth cylinder of greater diameter than the drive shaft, an intermediary portion of said opening formed in the same contour as the sleeve on the shaft to embrace the sleeve, and a tubular bushing encompassing the shaft and extending inwardly into the opening of said securing member to form a dust protected bearing surface between the sleeve, the securing member and the drive shaft within the interior of the abrasive stone.

## 2,771,720
## ABRADING IMPLEMENT

Albert Field, Dayton, Ohio

Application May 16, 1955, Serial No. 508,651
15 Claims. (Cl. 51—193.5)



1. An abrading implement for the rotary finishing of cylinder interiors and the like, including a tripartite filler member, the parts of said member being flexible and in back to back relation with one another to enforce a bending of said parts about their center lines to define an article wherein adjacent centers of said parts form a hub from which project equilateral spaced apart vanes, and means for maintaining said parts in an assembled relation with one another to define a unitary filler member as described.

## 2,771,721
## POLISHER HEAD ABRASIVE FEED

Ralph R. Bolsinger, Indianapolis, Ind.

Application June 21, 1955, Serial No. 516,981
2 Claims. (Cl. 51—193.7)

1. For advancing flexible sheets carrying abrasive from between radially extending backing brushes of a polishing head having a drive shaft, relatively positioned front and rear plates spaced along said heads both revoluble with said shaft; and transverse pins extending between said heads, said sheets being anchored by inner ends to said pins and initially circumferentially wrapped by portions of their length around said pins; a toothed wheel rockably mounted about said shaft inside of said front plate; means drivingly interengaging said pins with said wheel for simultaneous circumferential shifting of all of said pins around said shaft; a hand wheel revolubly carried by said shaft on the outer side of said front plate; an escapement lever rockably mounted on the inside of said front plate; a pair of spaced pawls on said lever rockable

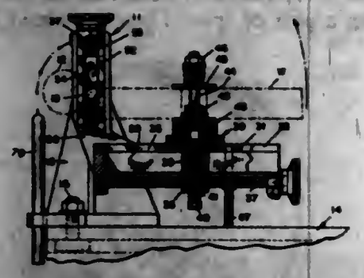
alternately in and out of the path of the teeth on said ratchet wheel; said front plate having a slot therethrough; a rock lever on said plate interconnecting the said escapement lever; a pin fixed to said rock lever and extending through said slot; and means on said hand wheel engaging said pin; the gripping of said hand wheel during turning of said shaft setting up travel between said ratchet wheel and said hand wheel advancing the ratchet wheel by one of said pawls relative to said front plate, unwrapping said sheets by that degree of advancement.

## 2,771,722
## ABRADING IMPLEMENT

Albert Field, Dayton, Ohio

Application December 13, 1954, Serial No. 474,669
2 Claims. (Cl. 51—195)

1. An abrading implement, including a multi-ply disc made up of an abrasive coated fabric material, an internally threaded grommet installed in said disc holding said plies is superposed contacting relation, one end of said grommet having a planar surface in approximately parallel contacting relation to the exposed surface of a terminal one of the superposed plies and the interior of said grommet being open to receive the threaded end of a mandrel whereby to support and to rotate said disc, and cut-outs in the periphery of said one end of the grommet opening through said planar surface to define therewith sharp edges tending to imbed themselves in the fabric of said one ply in response to relative rotation of said grommet and disc.



## 2,771,723
## RADIUS GRINDING FIXTURE

Robert N. Burleson, Culver City, Calif.

Application December 2, 1954, Serial No. 472,696
2 Claims. (Cl. 51—229)

1. A cutter holder fixture adapted to be mounted between centers on a grinding machine or the like for use in grinding a radius on a rotary cutter or other work, comprising an elongated body having a longitudinally

extending guideway including a slot through said body, a work support mounted on said guideway for adjusted positioning therealong and projecting through said slot, screw means carried by said body and engageable with said work support below said slot for accurately adjustably positioning said work support along said guideway, a pair of arms at the forward end of said body projecting

laterally from opposite side edges thereof, a vertical post extending normal to the general plane of said body carried at the end of each arm, said posts being parallel and longitudinally slotted, a center-receiving block slidably mounted on the slot of each post, screw adjustment means extending longitudinally of each post and including a screw threaded in each block for adjustably positioning the same vertically of the post.

## TWO-COMPARTMENT CONTAINER AND METHOD OF MAKING SUCH CONTAINER

Albert E. Hosier and Robert C. Butler, Ashland, Ohio, assignors to The Fuhrless Rubber Company, Ashland, Ohio, a corporation of Ohio

Application November 9, 1953, Serial No. 390,911
6 Claims. (Cl. 53—14)

1. A method of making a two section container comprising heat sealing opposed edge portions of two layers of thin flexible plastic material, bringing the sealed edge portions into adjacent relation to form two loops from the plastic material, forming a semi-permanent seal between the two layers of plastic material adjacent the sealed edge portions and parallel to such sealed edge portions to form two compartments from the plastic material, folding the sealed edge portions over against the plastic material and flattening the plastic material, cutting a container section from the plastic material, permanently sealing one end of the container section, filling the compartments of the container section, and sealing the remaining end of the container section.

2,771,725

## METHOD OF AND APPARATUS FOR USE IN APPLYING CONTRACTIBLE BANDS TO ARTICLES

Sidney T. Carter, Shrewsbury, Mass., assignor to Geo. J. Meyer Manufacturing Co., Cudahy, Wis., a corporation of Wisconsin

Application March 16, 1954, Serial No. 416,561
25 Claims. (Cl. 53—41)

1. In combination, in a band-applying machine wherein a pre-cut contractible band of predetermined length to be placed on a circular part is held in applying position while mounted on a cylindrical plunger of a diameter closely approximating that of the part to be banded, stripping means movable longitudinally of the plunger for slipping the band downwardly from off of the plunger and onto the part to be banded and fluid pressure means for increasing the diameter of the lower margin of the band

while the band is moving in an axial direction from off the plunger and onto the part to be banded.

2,771,726

## SHEET HANDLING AND ENVELOPE STUFFING MACHINE

Edwin H. Owen, Old Greenwich, Conn., and Walter J. Hanson, Port Chester, N. Y., assignors to Pitney-Bowes, Inc., Stamford, Conn., a corporation of Delaware

Application September 10, 1953, Serial No. 379,342
12 Claims. (Cl. 53—235)

1. In a device of the type described, a reciprocating ram for engaging flat workpieces, for conveying them edgewise in a path and for placing each workpiece as it approaches a loading station in said path, in an envelope positioned thereat; mechanism disposed adjacent said path for providing conveyable workpieces by taking sheets one-by-one and folding them transversely; means to receive and convey each folded workpiece in turn as it leaves said folding means, means supported in the path of the conveying means to position the workpiece in a predeterminded location in said path for engagement by said ram as the folded workpiece leaves the conveying means; and means for preventing operation of said ram past said predetermined location in an envelope filling direction until a workpiece from said folding mechanism has reached said predetermined location.

---

2,771,727

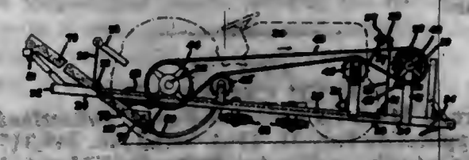
## ROCK GATHERING MACHINE

Roy James Buckler, Cochrane, Alberta, Canada

Application August 26, 1953, Serial No. 376,558
1 Claim. (Cl. 55—17)

In a rock gathering machine, the combination of a wheeled U-shaped frame having a forwardly projecting hitching tongue on the bight portion thereof, a transverse axle rotatably journalled in the free end portions of said frame, a pair of tubular stub-axles rotatably mounted on the end portions of said transverse axle, a stone pick-up reel secured to said stub axles, means for rotating said reel independently of the transverse axle, a trough-shaped stone collecting cradle secured to said transverse axle for rotation therewith coaxially within said reel, said cradle

having an open top substantially co-planar with the transverse axle and of a width substantially corresponding to the width of said reel, a quadrant provided on said hitching tongue, a hand lever movable over said quadrant, a shaft secured to and extending outwardly from said lever to one side of said frame, a crank provided at the outer end of said shaft, a second crank secured to an end of said transverse axle, and a link operatively connecting said second crank to the first mentioned crank, whereby said cradle may be tilted to a stone dumping position upon actuation of said lever.



---

2,771,728

## ROOT CROP HARVESTING AND CUTTING MACHINE

Robert Flay Mason, Magee, Miss.

Application June 22, 1953, Serial No. 363,035
1 Claim. (Cl. 55—51)

In a harvesting machine for root crops, a vehicle having front and rear spaced parallel axles, a rigid rectangular frame disposed beneath said vehicle with its sides disposed inwardly from the ends of said axles and with its ends projecting beyond said axles and pivoted inwardly from its rear end to said rear axle, diggers secured to and movable with said frame forwardly of said front axle, root crop elevating and cutting mechanism mounted on and movable with said frame rearwardly of and in alignment with said diggers, a sprocket wheel on said rear axle, power means on said frame for operating said elevating and cutting mechanism, a sprocket chain passing over said sprocket wheel and operatively connected with said elevating and cutting means, and means operatively associated with said frame for rocking said frame about said pivot.

---

2,771,729

## DOUBLE DUTY DISK HARROW

Leo H. Winkle, Deerwater, Mo.

Application April 24, 1950, Serial No. 157,671
2 Claims. (Cl. 55—61)

1. A disk harrow comprising a pair of main frame members, a plate telescopically securing the main frame members and holding them in longitudinal alinement, axially alined spaced disk harrow gangs facing in the same direction journaled to each member of the main frame, a sub-frame disk gang swivelled to the plate to turn substantially end for end in a horizontal plane and having the axis of its disk gang alined with and the disks facing in the same direction as the axes and disks respectively of the main frame disk gangs when the main frames are telescoped together, clamping means associated with the main and sub-frames to hold the sub-frame in position when the main frames are telescoped together, and additional clamping means associated with said main and sub-frames to hold the sub-frame rotated substantially end for end when the main frames are telescoped apart.

2,771,730

## LAWN MOWER AND TRIMMER

Martin E. True, Houston, Tex.

Application June 17, 1954, Serial No. 437,343
3 Claims. (Cl. 56—25.4)

1. A lawn mower and trimmer which comprises, in combination, a wheeled carriage having at least one inset leading wheel, an elongated blade rotatably mounted under said carriage in grass-cutting relationship to cut a swath through a lawn, an elongated rotatable pivoted arm mounted laterally on said carriage on the side of said inset leading wheel, said rotatable pivoted arm being provided with means for rotating said rotatable pivoted arm about its longitudinal axis, a rotatable trimmer blade carried on said pivoted arm adjacent the inset wheel in advance of said elongated blade, power means mounted on said carriage in spaced apart relationship from said elongated blade for rotating said blades, a first belt operatively connecting said power means to said elongated blade, a second belt operatively connecting said power means to said trimmer blade, means connected to said pivoted arm for pivoting said pivoted arm upwardly in a vertical plane to loosen said second belt and disengage said trimmer blade from said power means, guide means on said carriage in operative relationship with said second belt for maintaining said second belt in operative connection with said power means comprising a roller under said second belt and a guide member above said second belt an idler pulley mounted on said carriage in rotatable contact with said first belt for maintaining said first belt in tension for rotating said elongated blade, and means connected to said idler pulley for moving said idler pulley into and out of contact with said first belt, said blades cutting a substantially continuous swath of a width greater than the width of the swath cut by said elongated blade when said trimmer blade is trimming and edging simultaneously in a common horizontal plane with the rotating elongated blade by rotating said pivoted arm about its longitudinal axis to place the trimming blade in said horizontal plane.

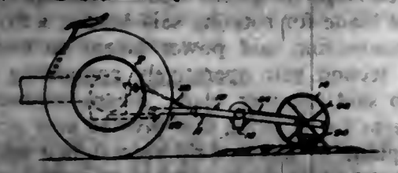
2,771,731

## PICKING ROLLS WITH CLEARING BEATER

Sherman C. Heth, Norman R. Krause, and Howard E. Whitney, Racine, Wis., assignors to J. I. Case Company, Racine, Wis., a corporation of Wisconsin

Application April 21, 1949, Serial No. 88,758
8 Claims. (Cl. 56—104)



1. In a corn harvester provided with a laterally directed chute, a stalkway having a rear panel and left and right hand snapping rolls provided with roll shafts and rotating oppositely to eject stalks downwardly, in combination, a beater adapted to urge snapped ears away from

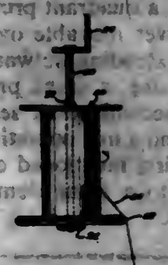
said rolls into said chute comprising a housing secured to said panel adjacent said chute, a beater shaft journaled in said housing the axis thereof being substantially parallel to the axis of said left hand roll, flexible beater paddles secured on opposite sides of said beater shaft adjacent said housing, and adapted to rotate substantially tangent to at least one of said rolls, one of said rolls being of reduced diameter at its discharge end in a region coextensive with the path of rotation of said beater paddles, a thrust member secured to said beater shaft adjacent said housing, a thrust washer intermediate said thrust member and said housing, said left hand roll shaft being rearwardly co-extensive with said beater shaft, means to rotate said beater comprising a pair of power transmitting members, one member being secured to said snapping roll shaft and the other being secured to said beater shaft and means to rotate said left and right hand rolls clockwise and counterclockwise, respectively.

---

**2,771,732**
**HAY TEDDER**
**Thomas Edwin Schraeffle, Columbus, Pa.**
**Application January 15, 1954, Serial No. 404,323**
**1 Claim. (Cl. 56—372)**

A hay tedder of the kind described comprising a frame including a pair of transversely spaced apart longitudinally extending side frame members, a plurality of transverse brace members secured at their opposite ends to said side frame members, a hollow drum secured to one end of one of said brace members transversely of said frame, a rotor in said drum having the axis thereof eccentric to the axis of said drum, a bearing on each of said side frame members engaging an end of said rotor for the rotation thereof, said drum being formed with segmental peripheral slots therethrough, radially extending teeth secured at one end to said rotor, the other end of each of said teeth being extensible through a directly related one of said slots for rotation of said rotor, means connecting one end of said frame to a tractor, having a power take off, for drawing said frame over an area of ground, a drive shaft connected at one end to the power takeoff, a bearing on another one of said brace members rotatably supporting the other end of said drive shaft, a sleeve slidable on said drive shaft adjacent said other end thereof, said sleeve having a longitudinally extending slot therethrough, intermediate the ends thereof, and an outwardly extending pin on said drive shaft engaging in said last mentioned slot, manually actuated means for sliding said sleeve on axially of said shaft whereby the hay lying on the ground is to be tedded upon movement of said drum over an area of earth.

---



**ERRATUM**

For Class 57—157 see:
Patent No. 2,772,191

---

**2,771,733**
**YARN AND METHOD OF PRODUCING THE SAME**
**William J. Leath, Charlotte, N. C., and Frank E. Bobo, Jr., Gainesville, Ga., assignors, by mesne assignments, to Patentex, Inc., New York, N. Y., a corporation of New York**
**Application October 19, 1954, Serial No. 463,274**
**28 Claims. (Cl. 57—140)**

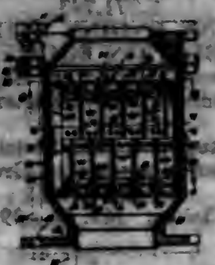
1. A heat set and then twisted synthetic resin yarn having a permanent pronounced tendency to untwist resulting in substantial wildness that causes the yarn to snarl when relaxed, the twist being sufficient to cause

substantial stitch distortion which imparts substantial stretchability and retractability to a fabric produced therefrom.

---

**2,771,734**
**WATCH CROWN SEAL**
**Ernest Meef, La Chaux-de-Fonds, Switzerland**
**Application July 21, 1953, Serial No. 369,317**
**Claims priority, application Switzerland May 6, 1953**
**4 Claims. (Cl. 58—90)**

3. In a watertight watch, in combination, a tube carried by and projecting from the case of the watch and communicating with the interior thereof; a winding and hand-setting control button formed at its bottom face facing the watch case with a recess composed of a first large and shallow cylindrical recess portion and a second deep cylindrical recess portion of a diameter larger than the external diameter of said tube but smaller than the diameter of said first recess portion, said second recess portion extending coaxially to said first recess portion almost through the whole height of said button, said button including a cylindrical projection formed integral therewith and protruding from the bottom of said recess coaxially therewith within said tube towards said bottom face of said button, said projection being adapted for mounting said button for turning movement about said tube; a single packing disc of easily deformable material formed with a central circular opening of a diameter smaller than the outside diameter of said tube and being defined by an inner peripheral surface, said disc having opposite side faces spaced from each other a distance larger than the difference between the diameters of said second recess portion and said outside diameter of said tube when the disc is in unstressed condition, said disc having an outer annular portion seated in said first recess and an inner annular portion bent substantially normal to said outer annular portion and extending between the wall of said second recess portion and the exterior of said tube with one of said side faces engaging said tube and said inner peripheral surface spaced from and directed towards the bottom of said second recess portion, said inner annular portion being compressed between said tube and said wall of said second recess portion; and a ring pressed into said first recess portion over said outer annular portion of said disc for keeping said disc on its seat, the internal diameter of said ring being larger than the outside diameter of said tube.



**2,771,735**
**METHOD OF WELDING THE ENDS OF A CHAIN LINK WHEREIN INITIAL POINT CONTACT IS OBTAINED BETWEEN THE ENDS**
**Thomas A. Wilson, Kenmore, Humphrey F. Parker, Buffalo, Raymond J. Kistler, Tonawanda, and Robert T. Gillette, Sardis, N. Y., assignors to Columbus McKinnon Chain Corporation, Tonawanda, N. Y.**
**Application October 24, 1953, Serial No. 388,709**
**2 Claims. (Cl. 59—35)**

1. A method of making a chain link which comprises, forming the opposite ends of a length of weldable metal bar into V-shaped form to present straight edge portions at the extremities of the bar which extend transversely thereof and which lie in separate, substantially perpendicular longitudinal planes, bending the bar into looped form so as to bring the opposite ends thereof into opposed abutting relation with the straight edge portions thereof disposed in transverse relationship to each other, and subjecting said end portions to welding temperature while pressing them together to plastically deform the V-shaped ends thereof while completing the weldment therebetween.

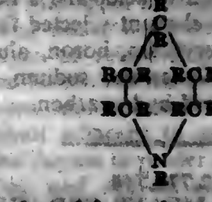
**2,771,736**
**EXHAUST GAS PURIFYING APPARATUS**
**Fred E. McKinley, Paramount, Calif.**
**Application March 3, 1955, Serial No. 491,893**
**10 Claims. (Cl. 60—30)**



4. Exhaust gas purifying apparatus for use with an internal combustion engine having exhaust valves that discharge exhaust gas into an exhaust manifold, and an accelerator pedal that controls the speed of said engine, comprising: a housing in communication with said manifold through which said exhaust gas is passed; an air pump driven by said engine; tubing interconnecting the discharge of said air pump with said exhaust manifold adjacent each of said exhaust valves; grid means disposed within said housing in the path of said gas, said grid means defining a plurality of gaps; an induction coil connected to said grid means for producing high voltage sparks across said gaps so long as electric current is supplied to said coil; and switch means for controlling the flow of electric current to said coil, said switch means being operatively connected to said accelerator pedal whereby it will permit current to flow to said coil only when said pedal is in a raised position.

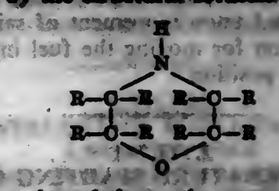
**2,771,737**
**PIPERIDINES AS HYPERGOLIC FUELS**
**Cleveland R. Scott, Arnold L. Ayers, and John E. Mahan, Bartlesville, Okla., assignors to Phillips Petroleum Company, a corporation of Delaware**
**No Drawing. Application December 4, 1951, Serial No. 259,896**
**10 Claims. (Cl. 60—35.4)**

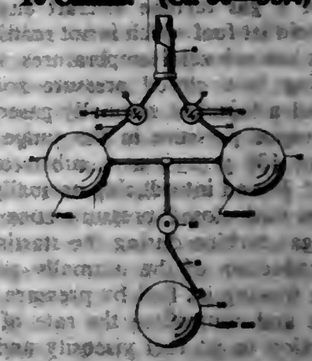
1. A method for producing immediate thrust comprising simultaneously introducing separate streams of an oxidant component and a fuel component of a bipropellant into contact with each other in a combustion chamber of a reaction motor in such proportions as to produce spontaneous ignition, said fuel component comprising a piperidine characterized by the structural formula



wherein R is selected from the group consisting of a hydrogen atom and a hydrocarbon radical selected from the group consisting of alkyl, alkenyl, aryl, cycloalkyl, cycloalkenyl, aralkyl and alkaryl radicals having not more than 12 carbon atoms and wherein the total number of carbon atoms present in said formula is not greater than 17.

---

**2,771,738**
**MORPHOLINES AS HYPERGOLIC FUELS**
**Cleveland R. Scott and Arnold L. Ayers, Bartlesville, Okla., assignors to Phillips Petroleum Company, a corporation of Delaware**
**No Drawing. Application October 1, 1951, Serial No. 249,217**
**9 Claims. (Cl. 60—35.4)**



1. In the method for developing thrust by the combustion of bipropellant components in a combustion chamber of a reaction motor, the steps comprising separately and simultaneously injecting a stream of a liquid oxidant component and a fuel component into said combustion chamber in such proportion as to produce spontaneous ignition, said fuel component comprising a morpholine characterized by the structural formula

wherein R is selected from the group consisting of a hydrogen atom and a hydrocarbon radical selected from the group consisting of alkyl, alkenyl, aryl, cycloalkyl, cycloalkenyl, aralkyl, and alkaryl radicals having not more than 12 carbon atoms and wherein the total number of carbon atoms present in said formula is not greater than 16.

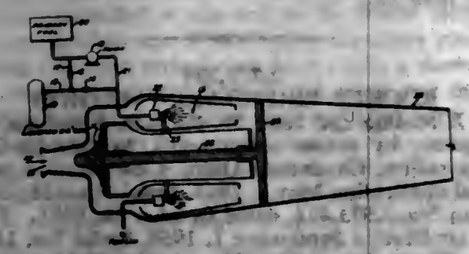
---

**2,771,739**
**ROCKET PROPULSION METHOD**
**Frank J. Malina and John W. Parsons, Pasadena, Calif., assignors, by mesne assignments, to Aerojet-General Corporation, Cincinnati, Ohio, a corporation of Ohio**
**Original application May 8, 1943, Serial No. 486,236, now Patent No. 2,573,471, dated October 30, 1951. Divided and application September 1, 1950, Serial No. 182,742, now Patent No. 2,693,077. Again divided and this application February 3, 1953, Serial No. 342,564**
**10 Claims. (Cl. 60—35.4)**

1. The method of producing thrust which comprises ejecting from a reaction chamber the gaseous products

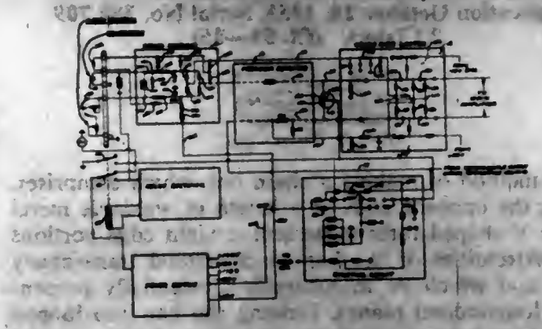
produced by the spontaneous combustion of an acid, selected from the group consisting of red fuming nitric acid and white fuming nitric acid, and a liquid fuel consisting essentially of an element selected from the group consisting of lithium, beryllium, boron, aluminum, magnesium, phosphorous, potassium, sodium and mixtures thereof, dispersed in liquid hydrocarbon.

---



2,771,740
**AFTERBURNING MEANS FOR TURBO-JET ENGINES**
Clarence L. Johnson, Encino, Calif., assignor to Lockheed Aircraft Corporation, Burbank, Calif.
Application November 16, 1950, Serial No. 196,040
12 Claims. (Cl. 60—35.6)

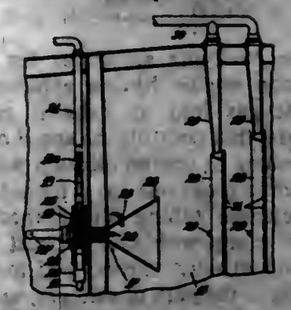
1. In combination; a pipe for discharging a stream of gases and air, a nozzle at the aft end of the pipe for discharging the stream in the form of a propulsive jet, a member movable axially in the pipe between a first position where it extends into the nozzle to reduce the cross sectional area of the same and a second position spaced forwardly from the nozzle, means for moving the member, movable fuel injecting means movable between a retracted position to a position projecting into the pipe, and means actuated upon movement of said member to said second position for moving the fuel injecting means to said projecting position.



---

2,771,741
**LOW-TEMPERATURE STARTING OF GAS TURBINE ENGINES**
Daniel P. Barnard 4th, Chesterton, Ind., assignor to Standard Oil Company, Chicago, Ill., a corporation of Indiana
Application May 16, 1952, Serial No. 288,355
2 Claims. (Cl. 60—39.06)

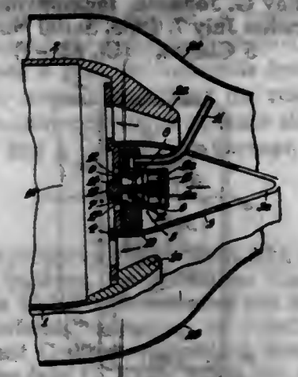
1. The method of effecting starting at low sub-zero temperatures of a gas turbine aircraft engine normally employing a liquid jet fuel which is not readily atomizable and ignitable at low sub-zero temperatures, which method comprises storing in a closed pressure zone separately from the jet fuel a liquefied normally gaseous hydrocarbon having a vapor pressure in the range of about 15 p. s. i. to about 100 p. s. i. at a sub-zero temperature of about —100° F. and introducing normally gaseous hydrocarbon from said closed pressure zone into jet fuel flowing to the gas turbine during the starting period, effecting the introduction of the normally gaseous hydrocarbon into the flowing jet fuel by pressure developed in the closed zone and controlling the rate of introduction to obtain reduction in jet fuel viscosity and the production of a fuel mixture which is atomizable and ignitable at low sub-zero temperatures.



2,771,742
**SAFETY CIRCUIT FOR GENERATOR UNIT OF THE JET FUEL CONTROL**
Charles B. Bruhn, Windsor Locks, Conn., assignor to United Aircraft Corporation, East Hartford, Conn., a corporation of Delaware
Application December 6, 1952, Serial No. 324,548
18 Claims. (Cl. 60—39.09)

10. In a speed responsive fuel control device for an engine, means for generating both a voltage varying with speed and a substantially constant voltage, means for comparing said two voltages to establish a speed error signal, a substantially constant voltage source, a connection connecting said voltage source with said first mentioned constant voltage including means for preventing the constant voltage supplied to said connection from dropping below a predetermined amount upon malfunctioning of said means for generating a substantially constant voltage.

---



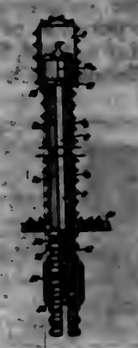
2,771,743
**GAS-TURBINE ENGINE WITH REHEAT COMBUSTION EQUIPMENT**
Alfred Cyril Lovesey, Littlemoor, England, assignor to Rolls-Royce Limited, Derby, England, a British company
Application August 4, 1952, Serial No. 302,455
Claims priority, application Great Britain August 10, 1951
10 Claims. (Cl. 60—39.72)

1. A gas turbine engine comprising main combustion equipment, wherein air is heated by the burning of fuel therewith, a turbine connected to the main combustion equipment to receive the heated air thereby to be driven, a duct connected to the outlet side of said turbine to receive gases exhausting from said turbine as a high velocity gas stream, fuel injection means to deliver fuel into said duct to be burnt therein to reheat the high velocity gas stream, a source of air under pressure separate from said high velocity gas stream, and jet-producing means located within said duct downstream of said fuel injection means including a connection to said source to receive pressure air therefrom and including outlet passage means directed substantially at right angles to the direction of flow of the high velocity gas stream thereby to inject air in jet form penetrating the high velocity gas stream substantially at right angles to its direction of flow, said jet-producing means having a small projected area on a plane within the duct at right angles to the direction of flow of the high-velocity gas stream.

2,771,744
**FUEL INJECTION MEANS OF COMBUSTION EQUIPMENT FOR GAS TURBINE ENGINES**
Francis Murray Johnson, Streatham, and Denis Richard Carlisle, Risley, England, assignors to Rolls-Royce Limited, Derby, England, a British company
Application April 27, 1953, Serial No. 351,112
Claims priority, application Great Britain May 7, 1952
6 Claims. (Cl. 60—39.74)

6. In or for combustion equipment of a gas turbine engine comprising an air casing including at least one wall adapted to define a duct through which substantially the whole of the air for combustion passes into the combustion equipment, a flame tube having at least one wall adapted to define a combustion space internally of said flame tube, said flame tube including air entry means adapted to admit air from externally of said flame tube to said combustion space, fuel injection means comprising an injector body means mounted adjacent a wall of said flame tube, said injector body means defining a passage means therethrough having an inlet end and an outlet end, said passage means opening at its outlet end to said combustion space and at its inlet end to said duct, a baffle member extending through the outlet of said passage means and extending within said passage means, said baffle member having an outwardly-extending portion at its downstream end which portion extends substantially across the axial projection of the passage means downstream of the outlet of said passage means, whereby air flowing into the combustion space through said passage means is diverted outwardly adjacent the outlet of said passage means, means defining a fuel-receiving surface adjacent the outlet of said passage means, part at least of said surface forming a boundary of said passage means, means defining a projecting lip at the downstream end of said surface, and means to supply fuel to said fuel-receiving surface.

---



2,771,745
**ASPHALT LINING**
Lloyd F. Brumble, South Houston, Tex., assignor to Gulf States Asphalt Company, Inc., Houston, Tex., a corporation of Texas
Application August 25, 1952, Serial No. 306,159
4 Claims. (Cl. 61—7)

1. An asphaltic composite lining for use in lining ditches and the like, comprising a central non-cracking flexible asphaltic composition layer, an upper intermediate layer of reinforcing material impregnated with asphalt and bonded to the upper side of said central composition layer, an upper coating layer of essentially pure asphalt adjacent to said upper intermediate layer and bonded thereto to render said upper intermediate layer non-curling and non-shrinking under weathering conditions, a lower intermediate layer of reinforcing material impregnated with asphalt and bonded to the lower side of said central composition layer, and a lower coating layer of essentially pure asphalt adjacent to said lower intermediate layer and bonded thereto to render said lower intermediate layer non-curling and non-shrinking under weathering conditions, said central asphaltic composition layer consisting essentially of pure asphalt and fillers mixed therewith wherein the asphalt in said central layer is present in an amount of from about 40% to about 80% and the fillers are present in an amount from about 60% to about 20% and wherein substantially all of the fillers is a mixture of fibrous material and pulverized or finely ground mineral fillers, said fibrous material and said mineral filler each being present in said central layer in amounts sufficient to provide the final composite lining which shows no deflection from a horizontal position when subjected to 150° F. for two hours and which also shows no flow when placed on a 45° angle and is subjected to 200° F. for one hour, and which does not crack or shatter when subjected to the impact of a one pound steel ball dropped from a distance of three feet at 0° F., said asphalt in said asphaltic composition layer and in said substantially pure asphalt coating layers having a melting point (ball and ring) in the range of about 140° F. to about 220° F., and a penetration at 77° F. of from about 55 to about 10, whereby said asphaltic lining is substantially uniformly non-curling, non-cracking, and pliable under sustained weathering and over a temperature range from about freezing to about 200° F.

---

2,771,746
**ANCHOR STRUCTURE FOR MINES, TUNNELS AND THE LIKE**
August Fischer, Dortmund-Gartenstadt, and Wilhelm Ketzler, Unna, Westphalia, Germany
Application December 11, 1952, Serial No. 325,426
Claims priority, application Germany May 5, 1952
4 Claims. (Cl. 61—45)

1. A supporting means for the roofs of mines having therein bore holes each having an enlarged chamber in the inner end thereof and a shoulder portion intermediate and between the enlarged chamber and the hole, comprising an elongated anchor in two longitudinal parts movable relative to each other and provided in the bore hole and chamber and each part having at its inner end a laterally extending and enlarged head which heads cooperate with each other to contact the shoulder portion in the bore hole to securely hold the anchor in the hole, said anchor parts both being completely secured in the bore hole in spaced relationship to each other and contacting each other at the enlarged head portions, and means extending between the two remaining parts maintaining them in spaced relationship.

2,771,747

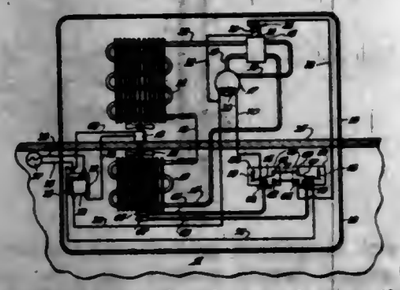
## OFFSHORE DRILLING BARGE

Eberhardt C. Rochelle, Beaumont, Tex., assignor to Bethlehem Steel Company, a corporation of Delaware

Application July 19, 1950, Serial No. 174,691

29 Claims. (Cl. 61—46.5)

1. A barge mounted on a body of water, comprising a buoyant member and a superstructure mounted thereon and temporarily supported by the buoyant member, hollow piling guide members in telescopic relation with each other connecting the buoyant member with the superstructure, piles mounted in the hollow telescopic guide members adapted to have their lower ends driven into the bed of the body of water, means for submerging the buoyant member in the body of water to an intermediate point on the tubular guide members, yokes, each of said yokes being associated with one of said piles, means to prevent relative vertical movement between said yokes and said piles, and means to gradually arrest relative vertical movement between said yokes and said superstructure.



2,771,748

## AIR CONDITIONING SYSTEMS FOR AUTOMATICALLY HEATING AND COOLING AN ENCLOSED AIR SPACE

John R. Prosek and John S. Palmer, Evansville, Ind., assignors, by mesne assignments, to Whirlpool-Seeger Corporation, a corporation of Delaware

Application May 6, 1954, Serial No. 428,802

8 Claims. (Cl. 62—4)

1. In an air conditioning system for conditioning the air in an enclosed space and having a reversing valve operable to reverse the functions of the heat exchangers thereof, a solenoid mounted in cooperation with said reversing valve and operating responsive to the energization thereof for operating said reversing valve, a power source, a cooling thermostat, a heating thermostat, each of said thermostats being formed to be adjustable over certain temperature ranges, means for simultaneously adjusting each of said thermostats by the same amount over spaced apart cooperating ranges, circuit means connected in said air conditioning system to said solenoid, said power source and associated with said thermostats for causing the energization of said solenoid and the operation of said air conditioning system responsive to the operation of said heating thermostat at certain temperatures and for causing the operation of said air conditioning system responsive to the operation of said cooling thermostat at certain other temperatures.

2,771,749

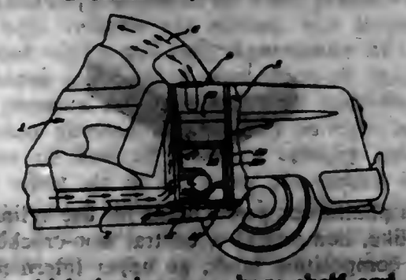
## ICE MAKING APPARATUS

Albert R. Miller, Miami Beach, Fla., assignor of one-half to Fay G. Johnson, Jacksonville, Fla.

Application July 7, 1953, Serial No. 366,683

5 Claims. (Cl. 62—7)

1. A device for producing automatically successive units of frozen liquid, comprising a supply of liquid, a compartment, having front, back, side, top and bottom walls, which is subject to below freezing temperature, a generally horizontal shaft mounted for turning in one of said compartment walls, a pair of freezing containers formed of heat-conductive material and having a common bottom disposed therebetween, said freezing containers being mounted on said shaft with said shaft extending longitudinally through substantially the midpoint of said common bottom, each said container being formed with a greater volumetric capacity on one diametric side of said shaft than on the other, whereby the contents of said container will be acted upon by gravity to pivot the container about the axis of said shaft, means for holding said containers against pivotal movement, means for transferring a charge of liquid from said supply to the uppermost of said containers whereby said charge is frozen to a solid state within the container, means for withdrawing said holding means whereby said containers are gravitationally pivoted to bring the empty container to the uppermost position, means for transferring a charge of liquid to the empty container whereby the heat from the new charge is transferred through the walls of the containers to incipiently melt the container contacting portion of said charge and loosen it for discharge from said first container.



2,771,750

## PACKAGE AIR CONDITIONING UNIT FOR AUTOMOTIVE VEHICLE

Oscar Ohlberg, Huntington Woods, Mich., assignor to Houdaille Industries, Inc., Detroit, Mich., a corporation of Michigan

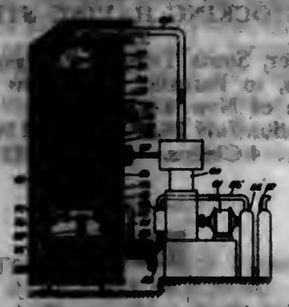
Application April 12, 1954, Serial No. 422,308

2 Claims. (Cl. 62—117)

1. In a vehicle having a package shelf and a luggage compartment, a complete air conditioning unit mounted

in the luggage compartment beneath said shelf comprising a frame structure housing air circulating means communicating with the interior of the vehicle through said package shelf, evaporator means horizontally disposed beneath said air circulating means, a condensate catching pan in underlying spaced relationship therewith for collecting the condensate drippings from the evaporator, passage means intercommunicating the interior of said vehicle with said evaporator means above the condensate pan for providing air circulation, a condenser defining the closed bottom of the structure and having upstanding side walls forming a pan, the underside being exposed to the ambient air, means for guiding the condensate from said pan to the condenser pan to enhance the efficiency of said condenser, and a compressor between said pan and condenser.

2,771,751



## GAS-FRACTIONATING INSTALLATION

Cornelius Otto Jonkers, Jacob Willem Laurens Kohler, August Albert Liebe, and Johannes van der Starr, Eindhoven, Netherlands, assignors to Hartford National Bank and Trust Company, Hartford, Conn., as trustee

Application July 15, 1954, Serial No. 443,582

Claims priority, application Netherlands July 24, 1953

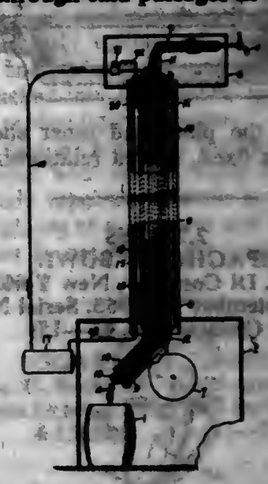
5 Claims. (Cl. 62—122)

1. A gas fractionating installation of the type employed with a cold-gas refrigerator comprising a rectifying column in which the vaporous fraction of the lowest boiling point of the gaseous mixture is condensed by means of said cold-gas refrigerator, means dividing said condensate into at least two portions, one portion serving as a washing liquid for said column and means discharging the other portion from said installation, the ratio between said portions being substantially independent of the cold production of said refrigerator, an insulated housing mounting said rectifying column, a container in said housing, a supply channel for furnishing condensate to said installation, at least two discharge conduits extending in a substantially vertical direction in said housing, and means for supplying heat to the condensate in said discharge conduits whereby a vapor-bubble pumping action occurs in each of said conduits.

2,771,752

## BEER COOLING APPARATUS

Edward E. Tennant, Milwaukee, Wis., assignor to Jos. Schlitz Brewing Company, Milwaukee, Wis., a corporation of Wisconsin



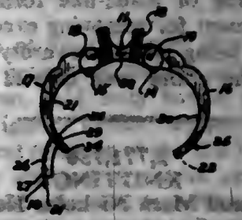
Application October 18, 1954, Serial No. 462,856

3 Claims. (Cl. 62—141)

1. In a beverage cooling system having a tap secured to a closed tap box and connected to a source of beverage in a refrigeration room remote from the tap by a beverage dispensing line extending through a shaft connecting the box and room, the combination which comprises refrigerating coils having a coolant therein and disposed to extend within said shaft from said room to the dispensing box and on either side of the beverage line, means to actuate the coolant to maintain the beverage in the line in a constant cooled condition, a passage in said shaft through which the beverage line extends, a second passage

in the shaft separate from said first-named passage, and blower means provided adjacent the shaft to circulate refrigerated air through said passages in opposite directions

and thereby in cooperation with the refrigerating coils effect cooling of the beverage flowing in the beverage line.



2,771,753

## SEGMENTED BAND HAVING TWO PIVOT JOINTS AND A LATCHED JOINT

Raymond Sallan, Huntington Woods, Mich.

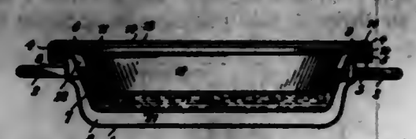
Application September 20, 1954, Serial No. 456,977

1 Claim. (Cl. 63—19.7)

A finger ring of three (3) elements comprising a central body, a pair of oppositely arranged aligned tongues projecting outwardly from opposite ends of said body, and a pair of opposed arcuate segments, yokes upon the upper ends of said segments positioned over said tongues, pins pivotally interconnecting said tongues and yokes respectively, the lower ends of said segments being in longitudinal registry and engagement to form a finger receiving band, one of said registering ends having a bore therein, a pin projecting longitudinally from the other registering end and cooperatively nested within said bore, and a clasp on the lower end of one segment, said clasp including an elongated channelled member mounted at one end over and loosely engaging the sides and outer surface of and pivotally joined to one segment, and having a transverse aperture adjacent its other end, said other end extending over the adjacent end of the other segment snugly and retainingly engaging the sides and outer surface thereof corresponding to the curvature of both segments, and having the same internal radius as said segments forming a perfectly circular opening, a locking pin projecting radially outward from adjacent the outer end of the other segment retainingly extending through the clasp aperture, and a tongue projecting longitudinally from the free end of said channelled member with its outer end turned outwardly.

2,771,754

## DISHES OR PLATES



Gilbert Wilkins, West Englewood, N. J.

Application May 27, 1954, Serial No. 432,737

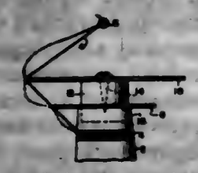
6 Claims. (Cl. 66—19)

5. A dish comprising, an outer shell, an inner shell within the same, a plate within the inner shell, a seat on

the rim of the outer shell, and a gasket mounted on said seat and formed with spaced annular grooves to receive

edge portions of the plate and inner shell to thereby hold these parts in fixed, spaced relationship.

---



**2,771,755**
**SPAGHETTI BOWL**
Pasquale F. Di Costanzo, New York, N. Y.
Application September 14, 1953, Serial No. 379,922
3 Claims. (Cl. 65—15)

1. A spaghetti bowl comprising a dished body having a depression spaced from the bottom thereof and adapted to receive the end portions of the prongs of a fork for rotation of the end portions in said depression, and an overhang extending inwardly from the edge of the body above the depression to provide means adapted to prevent spillage of food from the bowl during rotation of the end portions of the prongs of the fork within the depression, said overhang merging into a depending lip with said lip being of blade-like formation to provide a knife-like abutment for removing excess spaghetti from the fork, the lip being offset outwardly from the depression to expose the entire area of said depression.

---

**2,771,756**
**KNITTING**
Aaron Burleson and Mark Nicholas Holmes, Burlington, N. C., assignors, by mesne assignments, to Patentex, Inc., New York, N. Y., a corporation of New York
Application May 13, 1955, Serial No. 508,096
17 Claims. (Cl. 66—146)

1. For use in a knitting operation, a package of twisted nylon yarn wound on a core, which yarn possesses a tendency to kink when unwound in a relaxed condition, a member located adjacent the takeoff end of the core and having a smooth circular outer yarn-contacting surface, said member being formed from a material which sets up a static field as a result of the rubbing of the yarn over said yarn-contacting surface, thereby causing the yarn to adhere thereto while being unwound and preventing the yarn from kinking without exerting any substantial drag upon said yarn as it is drawn off said package, said member comprising the sole means for so controlling the yarn as it leaves the package.

---

**2,771,757**
**STRETCHABLE STOCKING**
Aaron Burleson and Mark Nicholas Holmes, Burlington, N. C., assignors, by mesne assignments, to Patentex, Inc., New York, N. Y., a corporation of New York
Application September 3, 1954, Serial No. 454,204
10 Claims. (Cl. 66—172)

1. A stretchable, retractable stocking which is substantially shorter in length than conventional stockings when relaxed, and is stretchable to correspond to various stocking sizes, said stocking being comprised of alternating courses of nylon yarns having opposite torques, at least one of said yarns not having been heat set, said yarns having permanent substantial liveliness such that the yarn will snarl when in relaxed condition and cause the

stitches comprising the alternating courses in the stocking to incline markedly in opposite directions and thereby substantially shorten the stocking when relaxed, and said inclined stitches being adapted to be straightened and the stocking thereby lengthened when the stocking is stretched longitudinally.

---

**2,771,758**
**LADY'S STOCKING HAVING STRETCHABLE ZONE**
Max F. Weller, South Temple, Pa., assignor, by mesne assignments, to Patentex, Inc., New York, N. Y., a corporation of New York
Application July 26, 1952, Serial No. 301,099
4 Claims. (Cl. 66—172)

1. A stocking having an integrally knit strain absorbing zone above the knee having a substantially greater stretch longitudinally of the stocking than the leg portion of the stocking, comprising a plurality of transverse bands knitted of relatively inelastic thread of synthetic resin, the thread of certain bands being longitudinally twisted in one direction and the thread of adjoining bands being longitudinally twisted in an opposite direction, each of said bands comprising no more than four courses so as to eliminate band effect in the appearance of said zone.

---

**2,771,759**
**TEXTILE PRODUCT AND METHOD**
William J. Lamb, Charlotte, N. C., and Frank E. Bebo, Jr., Gainesville, Ga., assignors, by mesne assignments, to Patentex, Inc., New York, N. Y., a corporation of New York
Application August 3, 1954, Serial No. 447,600
36 Claims. (Cl. 66—178)

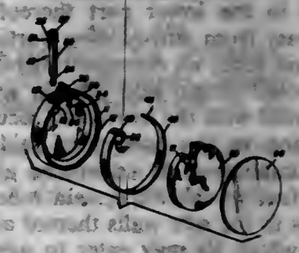
1. A stretchable, retractable stocking which is substantially shorter in length than conventional stockings when relaxed, and is stretchable to correspond to various stocking sizes, said stocking being comprised of alternating courses of oppositely twisted synthetic resin yarns having permanent substantial liveliness such that the yarns will snarl when in relaxed condition and cause the stitches comprising the alternating courses in the stocking to incline markedly in opposite directions and thereby substantially shorten the stocking when relaxed, and said inclined stitches being adapted to be straightened and the stocking thereby lengthened when the stocking is stretched longitudinally.

---

**2,771,760**
**PROCESS FOR PRODUCING KNITTED FABRIC**
Aaron Burleson, Burlington, N. C., assignor, by mesne assignments, to Patentex, Inc., New York, N. Y., a corporation of New York
No Drawing. Original application July 13, 1953, Serial No. 367,776. Divided and this application May 20, 1955, Serial No. 510,042
2 Claims. (Cl. 66—201)

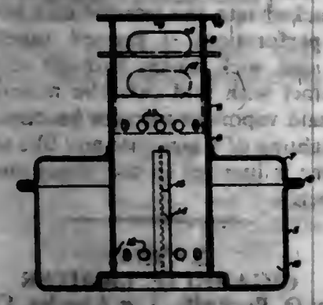
1. A process for producing knitted nylon fabric of substantial stretchability, which comprises presetting a continuous filament nylon yarn and then twisting said yarn to the left to impart substantial liveliness and twist torque thereto, presetting another continuous filament nylon yarn and then twisting said yarn to the right to impart substantial liveliness and twist torque thereto, to produce two oppositely twisted markedly lively but uncrimped and uncoiled continuous filament nylon yarns, applying a size to said oppositely twisted, lively, twist torque yarns to subdue temporarily the said liveliness and restrict the action of the torque imparted thereto, knitting said left and right twist yarns in alternation to form a fabric, and thereafter removing said size to release the torque in the yarn.

---



**2,771,761**
**LIGHTER STRUCTURE WITH COMPRESSIBLE, RESILIENT HOUSING**
Irving Florman, New York, N. Y.
Application June 19, 1956, Serial No. 592,350
8 Claims. (Cl. 67—7)

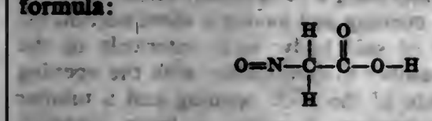
1. A flameless catalytic lighter for cigarettes and like smoking articles comprising a housing made of resilient and compressible plastic material, fuel receiving wick means contained in said housing, said housing terminating in a neck provided with external screw threads, a cylindrical member seated in said neck and having a bottom, said bottom being provided with an opening, a cup-shaped member for holding catalytic means and inserted in said cylindrical member, a tubular element having two ends and extending through an opening of said cup-shaped member, one of said ends terminating adjacent said catalytic means, a gasket seated on and surrounding said tubular element and being of a diameter corresponding to the inner diameter of said cylindrical member, a spring retained by the other end of said tubular element and spacing said cup-shaped member from said bottom of said cylindrical member, a cap in threaded engagement with said neck, said housing having minute perforations located adjacent said neck, said cap being provided with a flange normally overlying and closing said minute perforations when said cap is screwed down onto said neck, said cap flange freeing said minute perforations upon unscrewing said cap thereby causing said spring to urge said cup-shaped member away from said bottom of said cylindrical member, so that upon compressing and subsequent release of said resilient housing air sucked into the interior said housing through said minute perforations is pressed together with fuel vapors from said wick means through said tubular element for contact with said catalytic means, which upon contact with said vapor-air mixture becomes incandescent and enables lighting of a cigarette and like smoking article when the latter is inserted in the upper end of said cup-shaped member.



---

**2,771,762**
**CIGARETTE LIGHTER**
John O. Beckwith, Los Angeles, Calif.
Application October 29, 1954, Serial No. 465,581
4 Claims. (Cl. 67—7.1)

1. In a device of the character described: an annular body including peripheral flanges extending axially in opposite directions, said body having an opening therethrough for an igniter device, an opening therethrough for a wick adjacent one side of the first mentioned opening and an opening adjacent the wick opening and at the side thereof opposite the first mentioned opening; a tubular extension on the interior of the body and aligned with the first mentioned opening, said extension having a notch therein; an igniter device having a tubular body received in the first mentioned opening and in said extension and having a portion projecting inwardly of said extension, said igniter device including a peripherally serrated wheel; a wick in the wick opening and having a short portion extending outwardly of said body; walls interiorly of the body defining a chamber in conjunction with the opening at said opposite side of the wick opening and a tubular spring retaining extension therefor; a lever pivotally mounted in said chamber and carrying a cap at the outer end thereof, said lever having a position whereat the cap covers the outer exposed end of the wick and another raised position whereat said lever abuts against one edge of the chamber wall; a coil spring in said spring retaining extension, said spring being adapted to coact with the inner end of the lever, said end being so formed that when the lever is in the first mentioned position, the spring yieldingly urges said lever toward said position and when said lever is in the other position, said spring yieldingly holds said lever in said position; a leaf spring curved to the contour of the interior of the body and having one end engageable with the spring retaining extension and the other end turned back for frictional engagement with the body of the igniter device when the latter is positioned in the first mentioned opening and the first mentioned extension; filler material within the body, said filler material comprising fiber glass in layer form cut to conform to the interior configuration of the body, the wick having the major portion thereof extending into the mass of filler material; and discs secured to the sides of the body and within the respective flanges thereof.



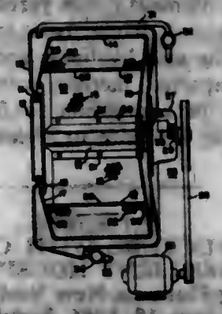
2,771,763
SOLID FUEL BURNING FLARE
Paul Krasnow, New York, N. Y., assignor to The Oraton Co., East Orange, N. J., a corporation of New Jersey
Application August 9, 1954, Serial No. 448,586
4 Claims. (Cl. 67—21)

1. A flare assembly comprising a container for a normally solid, liquifiable fuel composition, a burner tube extending upwardly from within said container and having openings in the lower part thereof through which liquid may pass from surrounding portions of said container into said tube, an elongated metallic heat transfer member disposed within said tube in spaced relation to the walls thereof with the lower end secured in heat conducting relation to the bottom of said container, said member terminating at its upper end above the normal level of the fuel in said tube, said tube being provided with openings in the side walls thereof adjacent its upper end through which air may enter to support combustion of fuel from the surface of a liquified portion thereof present in said tube.

2,771,764
ART OF PRODUCING CANDLES WITH COLORED FLAMES
Wilbur C. Meerman, Indianapolis, and Joseph C. Muhler, Bloomington, Ind.
No Drawing. Application December 2, 1953, Serial No. 395,856
2 Claims. (Cl. 67—22)

1. A candle for emanating colored light of high saturation comprising a mass of smoothly burning compatible molecules having the following general structural formula:

in which one of the hydrogen atoms is replaced by a selected metal to provide a chemical compound for producing light of a predetermined color, a wick for said candle having intimate association with the mass of material whereby said color producing metal is a constituent of the molecule itself and is distributed evenly through the mass and through the liquid produced by the melting thereof and is introduced to the wick by capillary action as an integral part of the melted combustible material.

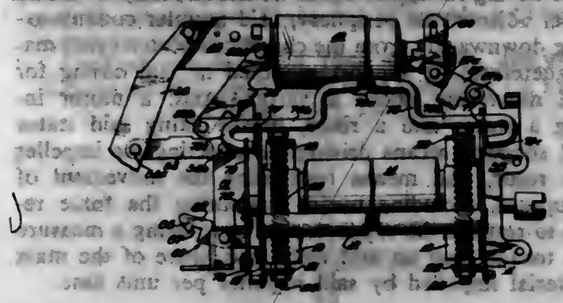


2,771,765
PHOTOFLASH LAMP
Edward G. F. Arnott, Upper Montclair, and Russell H. Atkinson, North Arlington, N. J., assignors to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application September 1, 1954, Serial No. 453,640
5 Claims. (Cl. 67—31)

1. A photoflash lamp comprising a radiation-transmitting bulb with a neck, a block of plastic forming a base in which the edge of said neck is embedded, a pair of spaced metallic leads traversing said base and projecting inwardly within said bulb, a dielectric coating on at least one of the inwardly projecting extremities of said leads, a paste primer supported by and between said lead inwardly projecting extremities and in contact therewith,

said dielectric coating insulating the metallic portions of the said dielectric coated lead portions from said paste primer, and a combustion supporting atmosphere contained within said bulb.

2,771,766
WASHING APPARATUS
Charles M. Dunlap, Mansfield, Ohio, assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application August 23, 1951, Serial No. 243,270
3 Claims. (Cl. 68—24)

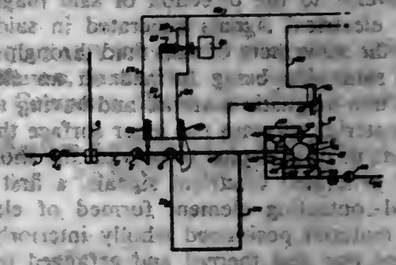


1. In apparatus for centrifuging fluid from fabrics, the combination of a perforate, generally cylindrical basket for containing the fabrics to be treated, means for rotating the basket at relatively high speed for centrifuging fluid from the fabrics, a member extending radially inwardly of the side wall of the basket and engaging the body of fabrics during a centrifuging operation, said member being of deformable construction, and means associated with the member for biasing the member to an extended position inwardly of the side wall of the basket when the basket is substantially inactive, said body of fabrics collapsing the member in opposition to the biasing means by centrifugal force during high speed rotation of the basket, the construction and arrangement being such that the member is returned to its extended position by said biasing means when high speed rotation of the fabrics is terminated for breaking the adhesive bond between the fabrics and the sidewall of the basket.

2,771,767
WRINGER CONSTRUCTION
Nicholas L. Etten, Cedar Falls, Iowa, assignor, by mesne assignments, to Chamberlain Corporation, Waterloo, Iowa, a corporation of Iowa
Application January 11, 1951, Serial No. 205,581
4 Claims. (Cl. 68—263)

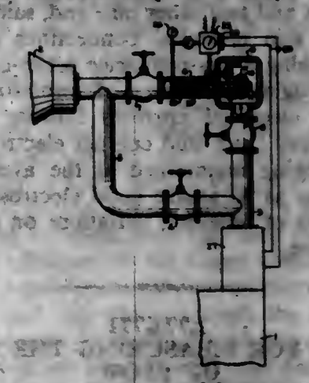
1. In a wringer, a frame, a first roll on said frame, a second roll movable from a position operatively engaged with said first roll to a position spaced therefrom, a manually operable reset member for moving said second roll, a movable latch member for releasably locking said reset member in a position in which said rolls are operatively engaged, resilient means urging said latch member to locking position, a pair of levers pivotally connected to said frame at spaced points for pivotal movement in either direction about said points, a link connecting said levers for movement together, each of said levers having a portion engageable with said latch, and

movement of said levers in either direction operatively engaging one of said portions with said latch member to move it against the action of said resilient means to a release position.



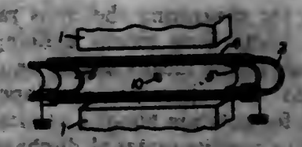
2,771,768
TORSIONALLY RESILIENT ANNULAR FASTENING MEMBER
Bert E. Tudor, San Mateo, Calif.
Application September 6, 1955, Serial No. 532,629
2 Claims. (Cl. 76—457)

1. A fastener device comprising a multi-strand braided steel cable, complemental attachment members fitted over the ends of said cable and fixedly secured thereto, one of said members having a hollow end provided with an inwardly directed locking shoulder, the other of said members having an end portion terminating in an enlarged semi-cylindrical head, said head being adapted to be inserted within said hollow end past said locking shoulder when one end of said cable is rotatably twisted to a predetermined degree with respect to the other end of said cable, said head being adapted to be retained within said hollow end by said shoulder when the twisted end of said cable is allowed to return to an untwisted condition, a pair of marking indica formed on the external surfaces of said attachment members, said indicia being offset with respect to each other to said predetermined degree when said attachment members are secured together and said cable is in an untwisted condition, and said indicia being in alignment with each other when one end of said cable is twisted to rotate said head to a position of release with respect to said locking shoulder, and a thin-walled, tough, flexible plastic covering enclosing said cable and secured against movement with respect to said cable, when said cable is twisted and untwisted, by means comprising corrugations defined by the braided strands of said cable.



2,771,769
CLAMPING DEVICE FOR FUEL PUMP TESTER
Axel Nielsen, St. Louis, Mo., assignor, by mesne assignments, to ACF Industries, Incorporated, New York, N. Y., a corporation of New Jersey
Application February 8, 1954, Serial No. 408,683
3 Claims. (Cl. 73—46)

1. Testing equipment comprising, in combination, a pneumatic system including a charging circuit, and a by-pass in said circuit having a flow indicator, a fixture for holding the device tested including a base for said fixture, a coupling on said base connected to said pneumatic system, a carriage slidable on said base for movement towards said coupling, power means for moving said carriage, control means for said power means connected to a



source of power to operate said carriage, means to energize said charging circuit and said by-pass sequentially, and means responsive to operation of said carriage by said power means to control the means to energize said pneumatic system.

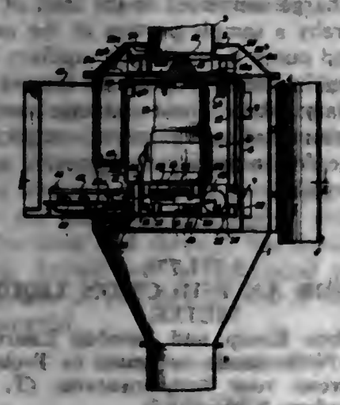
2,771,770
VISCOMETER SYSTEM
Jan Bouman, Delft, Netherlands, assignor to Shell Development Company, New York, N. Y., a corporation of Delaware
Application June 3, 1954, Serial No. 434,242
Claims priority, application Netherlands June 8, 1953
5 Claims. (Cl. 73—55)

1. A viscometer system comprising conduit means confining a main liquid stream, a pump disposed within said conduit, a capillary tube disposed within said conduit, said pump having an intake opening to the inside of said conduit and a discharge connected to the inlet of said capillary tube, whereby a sample portion of the main stream is forced by said pump through said capillary tube while the rest of the main stream is by-passed around said pump and said capillary tube in heat-exchange contact therewith, and pressure indicating means connected to the pump discharge for indicating the pressure at the inlet of the capillary tube.

2,771,771
DETECTOR FOR AN INDUCTION LIQUID FLOW METER
Johannes Jacobus Kamp and Jacobus Laurens Smals, Amsterdam, Netherlands, assignors to Technisch Ontwikkelingsbureau voor Instrumentatie, (T. O. B. I.) N. V., Amsterdam, Netherlands
Application July 17, 1952, Serial No. 299,518
1 Claim. (Cl. 73—194)

In a detector for an induction fluid flow meter adapted to measure the flow of a conductive fluid, the combination

of a pipe for carrying said fluid, magnetic field generating structure positioned exteriorly of said pipe to produce alternating magnetic flux transversely across said pipe, a pair of contact electrodes positioned within said pipe on a line transverse to the direction of said magnetic flux to pick up electrical signals generated in said fluid in response to the movement of said fluid through said magnetic field, said pipe being formed on an electrically-conductive, non-magnetic material and having a layer of insulating material adjacent the inner surface throughout the entire length of said pipe to prevent the short-circuiting of said generated electrical signals, a first annular-shaped fluid-contacting element formed of electrically-conductive material positioned wholly interiorly of said pipe adjacent one end thereof and arranged to encircle and make contact with the fluid passing through said one end, a first portion of said insulating material being disposed between said first element and said pipe, a first electrical connection arranged to establish low-resistance electrical contact between said first element and said one pipe end, a second annular-shaped fluid-contacting element formed of electrically-conductive material positioned wholly interiorly of said pipe adjacent the other end thereof and arranged to encircle and make contact with the fluid passing through said other end, a second portion of said insulating material being disposed between said second element and said pipe, a second electrical connection wholly distinct from said first connection and arranged to establish low-resistance electrical contact between said second element and said other pipe end, said fluid-contacting elements, said electrical connections and said pipe conjointly forming a low-resistance series-connected electrical path bridging said layer of insulating material to by-pass stray electrical currents flowing in said fluid around and away from said contact electrodes, said pipe also thereby being maintained at the average potential of said fluid so as to assure good electrostatic shielding from the effects of potential variations on said field generating structure.



---

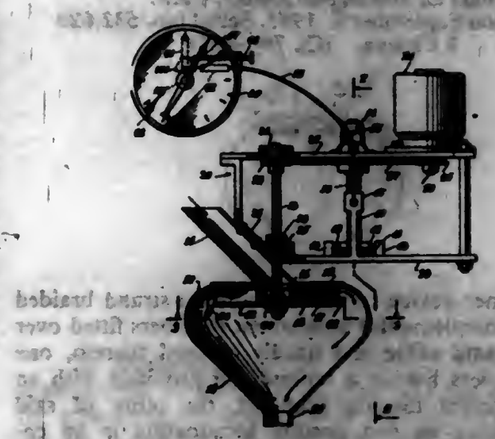
2,771,772

## APPARATUS FOR MEASURING THE MASS RATE OF FLOW

John O. Kirwan, Livingston, N. J., assignor to Wallace & Tiernan Incorporated, a corporation of Delaware

Application April 13, 1953, Serial No. 348,148
11 Claims. (Cl. 73—194)

1. Apparatus for measuring the mass rate of flow of fluent material, comprising means defining a chamber, fluent material conveying means having an outlet opening downwardly into said chamber, an impeller mounted in said chamber for rotation about a vertical axis aligned with said outlet to receive material discharged therefrom and to impel it centrifugally toward the periphery of the chamber, a generally cylindrical casing closed at the top and located below and in alignment with said impeller, an outer cylindrical wall concentric with said casing and cooperating therewith to define an annular receiving conduit having its upper end in communication with said chamber adjacent its periphery, said annular conduit extending downwardly from the chamber for conveying material therefrom, a support mounted in said casing for pivotal movement about a vertical axis, a motor including a stator and a rotor, means fixing said stator to said support, means drivingly connecting the impeller to the rotor, and means restraining the movement of said support, including means measuring the force required to restrain the support, said force being a measure of the torque load on said rotor and hence of the mass of material impelled by said impeller per unit time.



---

2,771,773

## MEASUREMENT OF MASS RATE OF FLOW OF FLUENT MATERIAL

Charles F. Wallace, Westfield, N. J., assignor to Wallace & Tiernan Incorporated, a corporation of Delaware

Application May 10, 1952, Serial No. 287,137
6 Claims. (Cl. 73—194)

1. Apparatus for measuring the rate of flow of a fluent material, comprising a casing, an impeller within said casing, an inlet conduit conveying fluent material to the central portion of said impeller, said impeller having at least one radial passage extending between said central portion and the impeller periphery, an outlet conduit conveying fluent material away from the periphery of the impeller, said casing, said impeller passage, and said inlet and outlet conduits defining a path for said fluent material through said apparatus, means driving said impeller at a substantially constant speed to accelerate all the passing fluent material through a predetermined substantially constant increment of velocity as it passes from the central portion of the impeller to the periphery, said driving means comprising a motor outside said path, a mechanical driving connection from the motor through the path defining means to the impeller, and a reaction member outside said path and subject to a reaction force applied through said driving connection and varying with the load on said impeller, a stationary member movably supporting said reaction member, means to apply to said reaction member a force opposing the reaction force, and means responsive to the position of the reaction member with respect to said stationary member to control said force applying means to balance the opposing forces, and means for measuring the force of said force applying means including means calibrated to translate the force measurement into a rate of flow measurement, said stationary member, said force applying means and said force measuring means all being located outside said path.

2,771,774

## LEVEL GAUGE FOR ENCLOSED PRESSURE VESSELS

Eraldo Fornaciari, Milan, Italy, assignor to Montecatini, società generale per l'Industria Mineraria e Chimica, a corporation of Italy

Application February 8, 1954, Serial No. 408,959
Claims priority, application Italy February 12, 1953
3 Claims. (Cl. 73—319)

1. In combination with an enclosed pressure vessel for a variable quantity of liquid, a level gauge comprising a hollow float of non-magnetic material and generally annular shape having a cylindrical inner wall portion, a pressure-resistant metal tube of non-magnetic material extending from the outside downwardly into said tank, said tube being upwardly open and having its interior sealed against the interior of said tank, said cylindrical wall portion of said float surrounding said tube for guidance of said float along said tube, a permanent magnet in said float having two poles adjacent said cylindrical wall portion at diametrically opposite sides thereof, a tube of transparent material coaxially disposed in said metal tube and of greater length than said metal tube so as to have a portion projecting upwardly beyond said metal tube, a magnetizable body of slight mass movably disposed in said transparent tube between said magnet poles to magnetically follow the level-responsive displacements of said float, an indicator member joined with said body in a fixed axial distance therefrom and having a travel path completely within said portion of said transparent tube so that said member is visible from the outside in any of its positions.

---

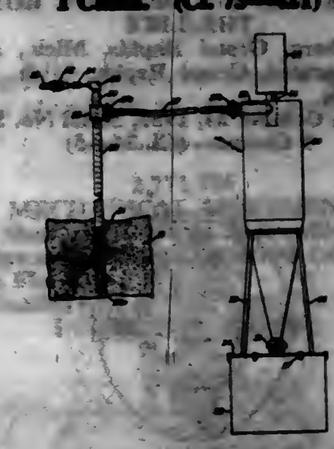
2,771,775

## SURFACE THERMOMETER WITH MAGNETIC RETAINING MEANS

George A. Argabrite, North Hollywood, Calif., assignor to Pacific Transducer Corp., Los Angeles, Calif., a corporation of California

Application May 28, 1954, Serial No. 432,983
2 Claims. (Cl. 73—343)

1. A magnetically retained surface thermometer comprising: an apertured inverted cup-shaped paramagnetic housing terminating downwardly in a lower edge adapted to contact a paramagnetic sample; a temperature responsive member within said housing and supported thereby; means above said housing for indicating the temperature of said member including an element movable in the housing aperture and responsive to movement of said member, a horizontally extending [illegible] fixed to the upper surface of the housing and in low reluctance contact therewith; and a permanent magnet fixed to said plate and extending downward therefrom and laterally spaced from the housing.



---

2,771,776

## CATALYST SAMPLING SYSTEM

Allan M. Haven, Texas City, Tex., assignor to The American Oil Company, Texas City, Tex., a corporation of Texas

Application April 28, 1954, Serial No. 426,893
1 Claim. (Cl. 73—421)

An apparatus for sampling bulk finely divided solids of wide particle size distribution which comprises in combination a sampling and eductor tube means, means for sealing the upper end of said tube, a fluidizing gas inlet duct extending within said sampling tube through the upper end thereof and terminating within said tube above the lower open end thereof, the said inlet duct being substantially smaller in cross section than said tube whereby a flow passage is provided therebetween, a beveled bottom end on said tube, an outlet from said flow passage through said tube and subjacent to the upper closed end of said tube, valved conduit means communicating with the upper end of said inlet duct through the closed end of said tube, valve means in said conduit for controlling the downward flow of gas through said inlet duct, solids separator and receiver means, a flexible hose connection between said outlet from said tube and said separator and receiver means, said separator and receiver means comprising a cyclone separator having a tangentially arranged inlet into which said hose connection discharges, a gas outlet from said cyclone separator, a bag filter superposing said separator and connected to the said gas outlet exteriorly of the separator, receiver means adjacent to said cyclone separator, removable cover means on said receiver means, stand means on said cover means for removably supporting said cyclone separator means, threaded coupling means on the lower end of said cyclone separator means removably connecting said separator means to said cover of said receiver means, and hasp means securing said cover to said receiver means.

---

2,771,777

## METHOD OF TESTING ANTIOZODANT CHEMICALS

Albert R. Allison and Alvin D. Delmas, New York, and Bernard B. Sheats, Franklin Square, N. Y., assignors to the United States of America as represented by the Secretary of the Navy

Application September 29, 1953, Serial No. 387,899
9 Claims. (Cl. 73—432)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. A method of testing the efficacy of antiozodant materials in the inhibition of ozone degradation of elastomers which comprises the steps of passing ozone through a first solution of an elastomer having a given viscosity, the solvent thereof being non-reactive with said ozone;

indicating the viscosity of the ozonized first solution; passing ozone through a second solution of said elastomer having said given viscosity, said second solution also containing a small amount of an antiozodant material; and indicating the viscosity of the ozonized second solution whereby a relationship exists between the respective differences in viscosities of said first and second ozonized solutions from said given viscosity.

2,771,778

**END PLATE FOR A GYROSCOPE ROTOR OR THE LIKE**

Arling W. Ryberg, Grand Rapids, Mich., assignor to Lear, Incorporated, Grand Rapids, Mich., a corporation of Illinois

Application October 24, 1955, Serial No. 542,196
9 Claims. (Cl. 74—5)

1. In a gyroscope or the like having its rotating mass concentrated principally in the annular rim of a rotating member in the form of a hollow flywheel, and in which the member serves as the rotor with respect to a fixed stator mounted internally of the rotor the improvement comprising: a disc for supporting said rim on the axis of rotation, said disc having a web forming a part thereof and positioned intermediate the rim and axis, said web being constituted as a section of a hollow cylinder coaxial with said axis and merged with the adjacent sections of the disc, said web being of less radial thickness than the axial thickness of said disc sections, whereby stresses on said disc having a tendency to buckle the disc are absorbed principally by deformation of the web and the regions of merger thereof with the adjacent disc sections.

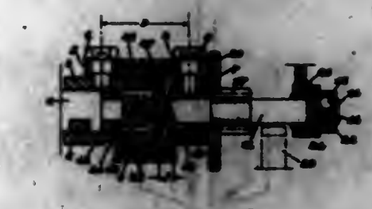
2,771,779

**QUICK SETTING MEANS FOR GYRO STABILIZED MECHANISMS**

Max A. Schadler, Williston Park, and Elliott J. Sitz, Whitestone, N. Y., assignors to Sperry Rand Corporation, a corporation of Delaware

Application February 8, 1955, Serial No. 486,768
16 Claims. (Cl. 74—5.34)

1. A quick setting arrangement for universally mounted gyroscopic apparatus slaved to a reference device, a reference device for said apparatus adapted to produce a control signal, a gyro on said apparatus having a pick-off responsive to precession thereof, a torquer for applying a troque on said gyro about its precession axis, a torquer for applying a torque about an axis of the apparatus, said first torquer being normally controlled by said reference device signal and said second torquer by said pick-off on the gyro, and means for quickly bringing the apparatus into synchronized relationship with the reference device including means for temporarily amplifying the control signal from the reference device and applying it to the second torquer.



---

2,771,780

**STARTING DEVICES FOR COMBUSTION ENGINES**

Theodore Jean-Baptiste Leblée, Paris, France, assignor to Bendix Aviation Corporation, Hoboken, N. Y.

Application August 13, 1954, Serial No. 449,566
Claims priority, application France August 26, 1953
6 Claims. (Cl. 74—7)

1. In an engine starter drive a motor shaft, a hollow sleeve fixedly mounted thereon, a driven shaft having a threaded portion and a toothed portion; a nut engageable with said threaded portion of the driven shaft to move said toothed portion into and out of mesh with a member of the engine to be started, a yielding means connecting the sleeve and nut, an abutment member on the driven shaft within the sleeve, and a cooperating shoulder in the sleeve positively limiting the meshing movement of the driven shaft and thereby causing said nut to move to compress said yielding means; said abutment member being also formed and arranged to engage said nut and thereby limit the compression of the yielding means.

---

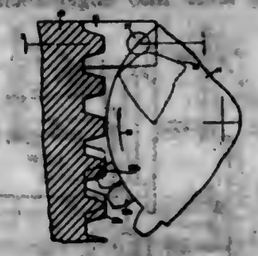
2,771,781

**ROTARY SEAL**

Josef Von Rassow, New Milford, Conn., assignor to Kollsman Instrument Corporation, Elmhurst, N. Y., a corporation of New York

Application July 18, 1955, Serial No. 522,700
7 Claims. (Cl. 74—18.1)

1. A moisture-proof sealed motion transmitting mechanism for transmitting motion to at least two radially displaced positions comprising: a casing, a closure member sealed to one end of said casing; a fulcrum within said casing; a rod mounted for universal rotation in said fulcrum; operating mechanism for said rod comprising a shaft rotatable around its axis and movable along its axis and a member carried by said shaft; means slidably interconnecting said last mentioned member and one end of said rod at a point displaced from the axis of rotation of said shaft; the free end of said rod extending beyond said closure member out of the casing; movement of said shaft toward the fulcrum causing said rod to displace the free end thereof further from an imaginary extension of the axis of said shaft; movement of said shaft away from the fulcrum causing said rod to displace the free end thereof closer to the axis of the shaft; said rod being translatorily rotatable in a conical path about the fulcrum as an apex on rotation of said shaft.



2,771,782

**RECIPROCATORY DRIVE FOR A RACK**

Walter Derby, Coventry, England, assignor to Smart Dovis Limited, Coventry, England

Application March 9, 1954, Serial No. 415,021
Claims priority, application Great Britain March 24, 1953
1 Claim. (Cl. 74—32)

In combination, a toothed rack freely movable in one direction, a rotatable toothed quadrant for moving the rack in the other direction, the rack having fast with it an abutment, the quadrant having fast with it a cam to coact with the abutment for sustaining the rack, after movement in the said other direction, until the trailing tooth of the quadrant has moved out of engagement with the rack, a second abutment fast with the rack, and a second cam fast with the quadrant to engage the second abutment after the return movement of the rack and before it is again moved in the said other direction in order to correctly position the rack so that it can be properly engaged by the leading tooth of the quadrant.

---

2,771,783

**RECIPROCATING MECHANISM FOR A COIN VENDING MACHINE**

John Krachewitz, Pittsburgh, Pa.

Application December 21, 1950, Serial No. 202,047
6 Claims. (Cl. 74—98)

1. In combination with the reciprocable frame of a vending machine as described, a master plate connected therewith provided with a longitudinal shaft clearance slot and upper and lower crank pin slots, a driving crank plate having a socket, a movable member having a crank pin operable through the slotted plate to engage the socket of the crank plate, and means for engaging and disengaging the crank plate including a shiftable cam engageable with said movable member to effect withdrawal of the crank pin from said crank plate.

---

2,771,784

**ADJUSTABLE SNAP ACTION MECHANISM**

Raymond Dellot, Cheektowaga, N. Y., assignor to Trico Products Corporation, Buffalo, N. Y.

Application March 2, 1953, Serial No. 339,639
4 Claims. (Cl. 74—97)

1. In a fluid motor having a power output shaft, reversing valve actuating means comprising, a first member, a second member secured to said shaft for movement therewith, and a third member extending between said first and second members for lost-motion engagement therewith, said third member being adjustable to

vary the degree of lost-motion between said third member and each of said first and second members.

---

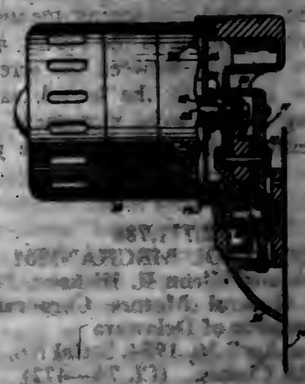
2,771,785

**MECHANICAL MOVEMENT**

Charles R. Short and George P. Bonfiglio, Clermont, Fla., assignors to Florida Industrial Laboratory, Inc., Clermont, Fla.

Application June 3, 1955, Serial No. 291,502
1 Claim. (Cl. 74—166)

In an apparatus for degumming vegetable fibres, the combination of a chain for driving a conveyor belt with mechanism for imparting progressive reciprocating motion to said chain, said mechanism including first and second crank means of different eccentricity, first and second pawl means engaging said chain from opposite directions, and link means connecting said first and second pawl means with said first and second crank means, respectively.



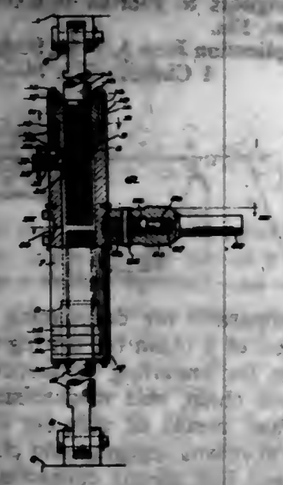
---

2,771,786

**MOTOR GEAR BOX**

Jack Gilbert, Newburgh, and Henry Preble, Jr., Cross River, N. Y., assignors to General Slicing Machine Co., Inc., Walden, N. Y., a corporation of New York

Application September 9, 1955, Serial No. 533,417
6 Claims. (Cl. 74—421)

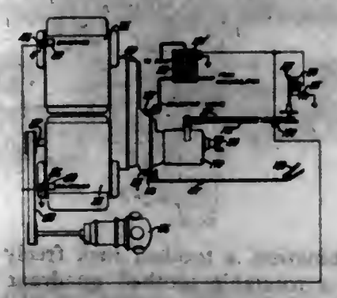


1. In combination, a casing, gearing operatively positioned therein including an output shaft extending exterior the casing; said casing being adapted to be filled with a fluid; said casing including framework presenting a seat spaced from a surface thereof about an opening into the casing through such surface, a motor having a fluid-tight bearing means for its shaft; said motor resting against said seat and the motor shaft extending into said casing through said opening, a gear carried on the

motor shaft within the casing, operatively engaging said gearing; said opening into the casing being sufficient for the entrance and exit of the motor shaft and its associated gear, a tubular member around said opening and motor shaft, communicative with the said casing and extending towards the motor, a frusto-form about the motor shaft, extending from the surface of the motor into said tubular member to form a ball-like joint structure therewith; one of the components of said joint structure having resilient quality and means to draw and hold the motor on said seat, whereby said resilient component is stressed whereupon said joint is fluid-tight.

---

2,771,787
PUSH-PULL JACK
John J. Dixon, West View, Pa., assignor to Duff-Norton Company, Pittsburgh, Pa., a corporation of Pennsylvania
Application November 8, 1955, Serial No. 545,747
11 Claims. (Cl. 74—424.8)



1. A push-pull jack comprising a tubular barrel having an end portion provided with an outwardly facing transverse surface, a nut slidably mounted in said end portion for axial movement only, a jack screw extending through the nut and outward from it, the nut having an inwardly facing transverse surface spaced from said barrel transverse surface, resilient cushioning means between said surfaces, the nut also having an outwardly facing transverse surface, resilient cushioning means engaging said last-mentioned surface, retaining means engaging the outer end of the second cushioning means, means connecting the retaining means to the barrel, and means for effecting relative rotation between the screw and nut to move the screw axially of the barrel, said cushioning means permitting limited axial movement of the nut in the barrel in either direction when the jack is under load.

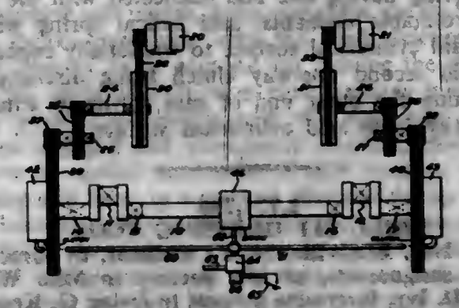
---

2,771,788
CONTROL MECHANISM
Charles H. Frick and Glenn R. Hickson, Pontiac, Mich., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application April 30, 1954, Serial No. 426,868
14 Claims. (Cl. 74—472)

1. In a power train including an engine, a fluid coupling operatively connected to said engine, a plural speed transmission driven by said engine through said fluid coupling, and means for controlling the drive ratio of said transmission, an engine control mechanism for governing the engine at a low idle speed and at a higher maximum speed with modulated manual control of intermediate speeds comprising, in combination, a floating actuating lever operatively connected to an engine fuel regulator, an operating lever movable in response to variations in the engine speed, a cam surface located adjacent the floating lever, said floating actuating lever being pivotable on said operating lever on an axis translatable relative to said cam surface, a speed and fuel supply setting lever movable freely from idle to full speed and torque position having means thereon urging the floating actuating lever into engagement with the cam

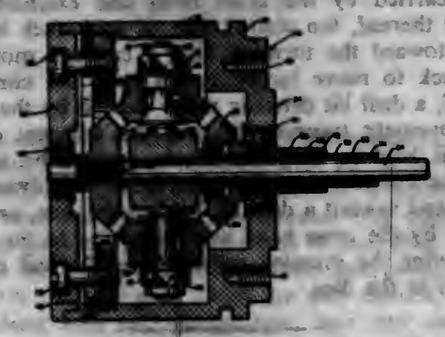
surface to modify movement of the actuating lever and fuel supplied the engine by movement of the operating lever in response to variations in the engine speed, and means being effective in one operative position of said transmission drive ratio controlling means to limit the engine to a different predetermined maximum engine speed.

---



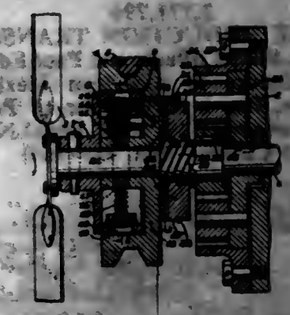
2,771,789
WINDOW REGULATING DEVICE
Peter F. Rossmann, Grosse Pointe Farms, Mich., and Karl Ruth, New York, N. Y., assignors to Happ Corporation, Cleveland, Ohio, a corporation of Virginia
Original application April 10, 1948, Serial No. 20,243, now Patent No. 2,631,926, dated December 16, 1952. Divided and this application November 5, 1952, Serial No. 318,932
3 Claims. (Cl. 74—625)

1. In a window regulator, operating mechanism for raising and lowering a window, means for controlling said mechanism comprising an electric motor with means for starting the same in either direction, a driving shaft for said mechanism, a spring clutch between said shaft and mechanism comprising a pair of interengaging sector-shape clutch members coextensive with said shaft and said mechanism, respectively, a cylindrical housing enclosing said members, a coil spring frictionally engaging the inside of said housing and having hooked ends inserted between the adjoining end faces of said members, whereby to allow rotary motion to be transmitted from said shaft to said mechanism in either sense of rotation by contraction and release of said spring from said housing and to prevent transmission of motion in the reverse direction by expansion and tightening of said spring against said housing, means for rotating said housing by said motor, and a further coil spring surrounding said shaft and having hooked ends engaging depressions in said housing, said further coil spring having a first position substantially released from said shaft when said housing is stationary, rotation of said housing by said motor causing contractual movement of said further coil spring to a second position tightened upon said shaft thereby to establish a frictional driving connection between said housing and said shaft, and control means for manually rotating said shaft, said further coil spring in its first position permitting manual rotation of said shaft.



2,771,790
DOUBLE DRIVE POWER PUNCH PRESS
Frederick E. Mueschenborn, Buffalo, N. Y., assignor to Niagara Machine & Tool Works, Buffalo, N. Y.
Application July 12, 1954, Serial No. 442,848
8 Claims. (Cl. 74—665)

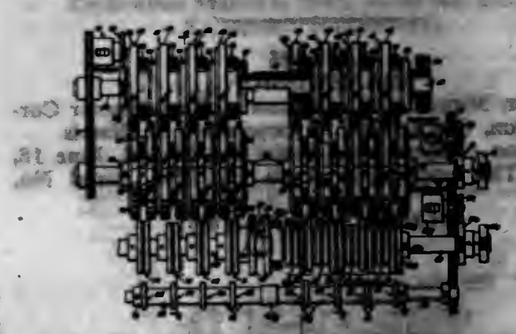
1. In a power press of the double crank type including a crankshaft having a pair of cranks spaced axially therealong, a pair of independent electric driving motors for applying driving torque to said crankshaft at opposite sides of said cranks, driving wheel means disposed at opposite ends of said crankshaft coaxial therewith and a clutch mechanism acting between each driving wheel means and the associated end of said crankshaft, and similar but independent intermediate transmission and speed reducing gear means acting between each driving motor and each of said clutch mechanisms.



---

2,771,791
DIFFERENTIAL GEARING APPARATUS
Rudolph E. Beckmann, Babylon, N. Y., assignor to Trans-American Precision Instrument Corp., Flushing, N. Y., a corporation of New York
Application December 13, 1954, Serial No. 474,677
2 Claims. (Cl. 74—675)

1. A differential gearing apparatus comprising a gear housing having opposed side walls, differential gearing within the housing including two opposed bevel gears and a rotatable spider carrying opposed bevel pinions each meshing with said bevel gears, said differential gearing being mounted on the opposed side walls of said housing by means of three concentric shafts extending through one of said side walls of said housing for their driving and driven connections, the innermost of said shafts having one of said bevel gears fixed thereto, the other two of said shafts comprising sleeves rotatable relative to said innermost shaft, one sleeve being fixed to said rotatable spider and the other sleeve being fixed to said other bevel gear, the innermost shaft being bearingly mounted in the side wall opposite to the side wall through which the shafts extend, the structure of said bevel gear and sleeve and the structure of said spider and sleeve being provided with a bearing therebetween, and the outermost sleeve being bearingly mounted on the side wall through which the shafts extend.



2,771,792
ENGINE COOLING FAN DRIVE GEARING
Maurice P. Whitney, Elmira, N. Y., assignor to Bendix Aviation Corporation, Elmira Heights, N. Y., a corporation of Delaware
Application April 23, 1954, Serial No. 425,155
5 Claims. (Cl. 74—752)

1. In a variable speed drive for engine-driven auxiliary devices, a rotatable driven shaft, a driving pulley journalled thereon having a clutch face formed on one side thereof, a high speed driven clutch member fixed on said shaft adjacent the pulley, a driving clutch member mounted on the pulley, yielding means urging the clutch members into engagement, centrifugal means for separating the clutch members, a screw shaft journalled on the driven shaft adjacent the pulley, a low speed clutch operating nut threaded on the screw shaft for clutching engagement with said clutch face of the pulley to thus be driven thereby, a sun gear fixed on the screw shaft, a planet gear meshing therewith, a carrier for said planet gear fixed on the driven shaft, and a fixed orbit gear surrounding and meshing with the planet gear.

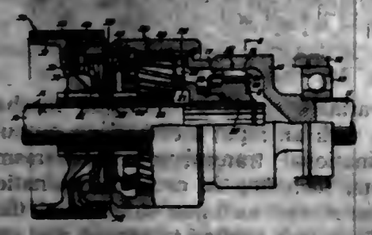
---

2,771,793
MULTIPLE SPEED TRANSMISSION MECHANISM
Azor D. Robbins, Hempstead, N. Y., assignor to The W. L. Maxson Corporation, New York, N. Y., a corporation of New York
Application July 16, 1953, Serial No. 367,201
7 Claims. (Cl. 74—753)

1. In a variable speed transmission mechanism, the combination with an input member, an output member, and denominational transmission mechanism between said members, including in each denomination a summing differential and an input differential therefor, the summing differentials serving to receive and combine the inputs from such of the input differentials as may be active, and each input differential comprising an input planet gear carrier driven from the input member and alternatively lockable parallel transmission and waste gears which include circumferential teeth, so that any input differential can be rendered active or inactive as desired, a ratio selector comprising a cam shaft, and for each of several denominations, a two disc cam fast on the cam shaft, a U-shaped cam follower, means rockably supporting the cam follower, axially offset projections on the follower engageable with the respective discs of the cam at opposite sides of the cam shaft, and axially

offset hooks carried by the follower for engagement respectively with the circumferential teeth of the transmission and waste gears of the associated input differential, and movable alternatively toward and from gear engagement.

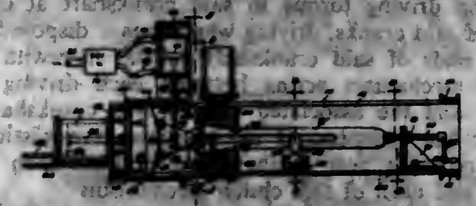
---



2,771,794
REVERSIBLE REDUCTION TRANSMISSION
Robert H. Shenk, State College, and Paul Edward Peathe, Erie, Pa., assignors to American Flexible Coupling Company, Erie, Pa., a corporation of Pennsylvania
Application November 20, 1952, Serial No. 321,612
13 Claims. (Cl. 74—764)

1. A reversible planetary reduction gear comprising a floating sun gear, planet members mounted on a flexible mounting in meshing engagement therewith, a planet support for carrying said planet members included in said flexible mounting, a ring gear, an annular gear coupling having the teeth on the outer side thereof engageable with the internal teeth of said ring gear and the internal teeth thereof in meshing engagement with said planets, brake means for selectively stopping said planet carrier and said ring gear, an input shaft connected to said sun gear, an output shaft, and means for selectively connecting said output shaft to said ring gear and said planet carrier to transmit rotative force therebetween, said flexible mounting for said planet members comprising a cutaway portion nesting the planet support members, said planet support members having internal splined teeth engaging teeth on said cutaway portion.

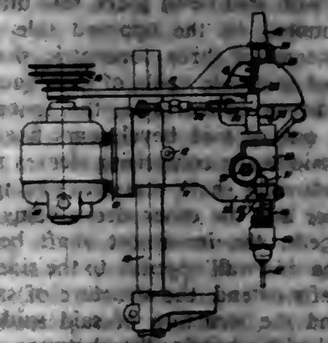
---



2,771,795
TRANSMISSION
Palmer Orr, Muncie, Ind., assignor to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Continuation of application Serial No. 99,890, June 18, 1949. This application April 19, 1952, Serial No. 283,163
4 Claims. (Cl. 74—781)

1. In transmission mechanism, the combination of driving and driven shafts; ratio changing means operatively connected between said shafts and comprising a gear set including a pair of relatively rotatable elements, one of which, when held stationary, serves as a reaction element to complete a ratio drive between said shafts; means operatively connected between said shafts and including a one-way clutch engageable to establish a one-to-one drive from one of said shafts to the other of said shafts; said one-way clutch comprising a pair of concentric members and a plurality of wedging elements adapted to wedge between said concentric members; and a second one-way clutch operatively connected between said pair of relatively rotatable elements of said ratio changing means and engageable to establish a one-to-one drive from said other of said shafts to said one shaft; said second one-way clutch comprising a cylindrical surface formed on one of said rotatable elements and a helical spring having one end connected with the other of said rotatable elements; said helical spring winding against said cylindrical surface to frictionally engage the same; said second one-way clutch being disengageable by actuating the other end of said spring to wind the spring away from said cylindrical surface.

---

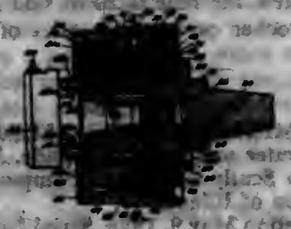


2,771,796
DRILL BIT DRESSING TOOL
Milo W. Ives, Ellenville, N. Y., assignor, by direct and mesne assignments, of fifty percent to Milo Warren Ives, Mt. Ivy, forty-nine percent to Irving G. Kennedy, Stony Point, and one percent to Alton W. Teale, Suffern, N. Y.
Application February 13, 1953, Serial No. 336,697
7 Claims. (Cl. 76—5)

1. In a drill bit dressing tool, a drill bit holder which includes a pair of spaced parallel elongated guide rails, drill bit forming dies carried by the guide rails intermediate the ends thereof, clamp means carried by the guide rails for holding a drill bit in the dies and parallel with the guide rails, a cross head mounted on the guide rails adjacent the forming dies for movement in a rectilinear path toward and away from said dies, a convex track carried by the cross head and extending transversely thereof, the convex side of said track being disposed toward the forming dies, a carriage mounted on the track to move longitudinally over the convex side thereof, a drill bit dressing roller carried by the carriage for movement transversely over the adjacent end of a drill bit held in the dies, means carried by the guide rails and connected to the cross head for advancing the cross head toward a drill bit held in the dies, and means carried by the cross head and connected to the carriage for moving the dressing roller across the end of a drill bit held in the dies.

---

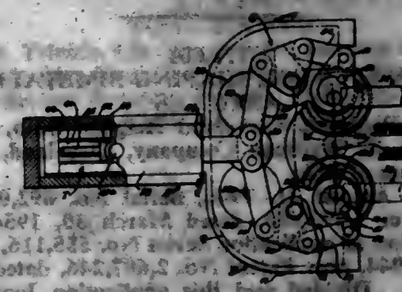
2,771,797
DRILL PRESS
Hardy W. Bushow, San Leandro, Calif.
Application May 5, 1952, Serial No. 285,115
11 Claims. (Cl. 77—39)



1. In a drill press, a frame, a vertical shaft carried by the frame, the lower end of the shaft being adapted for

attachment to a drill, a sleeve concentric with the shaft and through which the shaft extends, said shaft being journaled in said sleeve, a member movable vertically with respect to the frame, a pinion carried by said member, an operating lever connected to said pinion whereby the pinion is turned when the operating lever is moved in a vertical direction, a gear rack formed on said sleeve and engaging said pinion, drive means for the shaft including a sheave concentric with the shaft, friction clutch means adapted to be engaged for causing the sheave to drive the shaft, said friction clutch means including a clutch member concentric with the shaft and movable between engaged and disengaged clutching position responsive to vertical movement of said member, whereby swinging said lever in a vertical direction causes the drill to be lowered against a work piece and to cause said friction clutch means to be engaged to drive the drill when the drill is pressed against the work piece, and camming means acting between said member and said frame and serving to move the member in a vertical direction responsive to swinging said lever in a horizontal direction, whereby such movement of said member causes engagement or disengagement of said friction clutch means independently of pressure between the drill and the work piece.

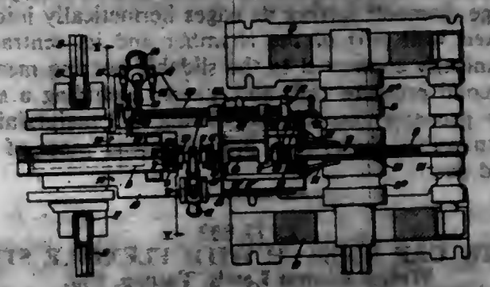
---



2,771,798
GROOVING OR FACING HEAD
Howard R. De Vlieg, Grosse Pointe Woods, Mich., assignor to De Vlieg Machine Company, Detroit, Mich., a corporation of Michigan
Application April 19, 1951, Serial No. 221,783
1 Claim. (Cl. 77—58)

In a grooving or facing head, in combination, a rotary cutter holder, a first gear rotating with the cutter holder coaxial with the axis of rotation thereof, a pinion gear in mesh with said first gear, an annular ring supporting said pinion gear and normally carried by the cutter holder to revolve therewith so that the pinion gear is moved in unison with the first gear about the axis thereof, a free gear meshing with said pinion gear, said ring and said free gear being coaxial with the axis of rotation of the cutter holder, said first gear being operatively responsive to rotation of the cutter holder and the retardation of said annular ring from rotation with the cutter holder to drive said pinion gear for rotation relative to the cutter holder to in turn drive the free gear for rotation relative to the cutter holder, an externally threaded lead screw revolving in unison with the rotating cutter holder, a first clutch member attached to said lead screw, a complementary second clutch member loosely mounted on said lead screw and resiliently urged into engagement with the first clutch member, said second clutch member being driven for rotation by the free gear to drive the lead screw through said first clutch member for rotation relative to the cutting holder, and a cutter-carrying slide revolving in unison with the rotating cutter holder and threadly engaging said lead screw to move lengthwise thereof upon rotation thereof about its own axis to move the cutter transversely of its axis of rotation in response to rotation of the free gear relative to the cutter holder for effecting such rotation of the lead screw.

---



2,771,799
THREAD ROLLING TOOL
James W. Batchelder, Amesbury, Vt.
Application December 28, 1953, Serial No. 400,824
16 Claims. (Cl. 80—9)

1. A side working surface rolling tool adapted for use in a metal working machine having a work piece rotating means, a tool holder for advancing a tool radially to a work piece, and tool actuating fixed stop means, comprising: a shank adapted to be held in said tool holder; a rigid tool frame slidably mounted to said shank; resilient means operatively disposed between said shank and frame to bias the frame in one direction relative to the shank; a pair of opposed dies for roll forming the surface of a rotating work piece; means mounting the dies to said frame including rotatable spindles each having an eccentric whereon one of said dies is journalled whereby said dies are closed and opened relative to each other by spindle rotation; means on said frame to engage said stop means during tool holder advancement to effect relative motion between said shank and frame; and a mechanism on the frame connecting said spindles for simultaneous rotation of one with the other, the said mechanism including a motion converting connection to said shank whereby said relative motion rotates said spindles to close said dies.

---

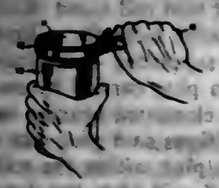
2,771,800
PLUG ROLLING MILL
Andrew F. Kritscher, Pittsburgh, Pa., assignor to United States Steel Corporation, a corporation of New Jersey
Application March 6, 1952, Serial No. 275,119
5 Claims. (Cl. 80—11)

1. A plug rolling mill adapted to roll reheated and pierced billets comprising at least one roll stand, a trough on the entry side of said roll stand in alignment therewith and adapted to receive work for rolling, a longitudinally movable plug bar supported in alignment with said roll stand and trough, a plug carried by one end of said plug bar and having an elongated bearing surface, stop means which initially positions said plug bar and plug with the forward end of the plug within the roll stand and which limits movement of said plug bar from said roll stand, motive means for continuously advancing said plug bar and plug through said stand during a rolling operation in a direction counter to that in which the work travels therethrough and continuously presenting a fresh surface of the plug to the portion of the work which is moving within said roll stand, means for actuating said motive means and starting said plug bar and plug in motion when the work engages the forward end of the plug, and means

an abutment attached to said screw member, and a stop

for stopping the advance of said plug bar and plug when the back end of the latter is within said roll stand at the end of the rolling action, thereby preventing the work from seizing on the plug.

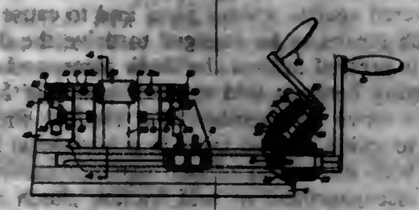
---



2,771,891
APPARATUS FOR SHAPING BIMETALLIC ARTICLES
Samuel K. Wellman, Cleveland Heights, Ohio, assignor to The S. K. Wellman Company, Cleveland, Ohio, a corporation of Ohio
Application August 21, 1946, Serial No. 692,064, now Patent No. 2,673,489, dated March 30, 1954, which is a division of application Serial No. 555,116, September 21, 1944, now Patent No. 2,607,245, dated August 19, 1952. Divided and this application January 25, 1954, Serial No. 406,747
2 Claims. (Cl. 80—56)

1. Apparatus for bending laminated bimetallic articles to a predetermined curved shape comprising a supporting structure; a pressure roll rigidly supported in the said structure for rotation about a fixed axis; a second cooperating pressure roll; bearing means for the second roll slidably supported in the said structure for movement toward and away from the fixed axis roll while maintaining the axis of the second roll in a fixed plane through the axis of the other roll; means for rotating at least one of said rolls; means urging the second roll toward the other roll comprising an expansible chamber having a fixed wall part rigidly mounted on the said supporting structure and a flexible sheet metal diaphragm of large diameter having its edges hermetically joined to the fixed wall part of the chamber and its central part mechanically connected to the slidable bearing means of the second pressure roll; and means, including a source of low pressure gas, for introducing and maintaining in the expansible chamber a predetermined mass of compressed gas.

---



2,771,892
SCREW CAP WRENCH WITH FLEXIBLE STRAP
Walter Benton Lewis, Tampa, Fla.
Application March 11, 1955, Serial No. 493,761
1 Claim. (Cl. 81—3.43)

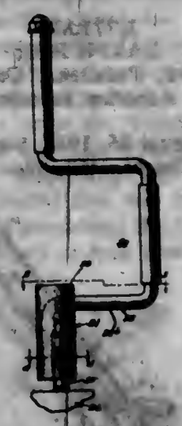
A tool for encircling and gripping an object in a manner to apply rotative force thereto comprising a strap, a lever composed of a length of wire or rod stock and including spaced substantially parallel side portions with transverse connecting end portions and another transverse connecting portion intermediate said end portions but nearer one of such ends, and adapted to have one end of said strap attached thereto, and the remainder of the strap located around a device to be rotated, one end portion of said lever being adapted to bear upon said strap and hold the same against the object so that when the end of the lever is swung it will first cause a binding action upon the strap about the object and thereafter cause rotational force upon said object.

---

2,771,893
VISE FOR HOLDING WORKPIECES OF DIVERSE SHAPES
Gordon Francis Staples, East Kilbride, and Robert Mitchell, Castle Brunswick, Birmingham, England
Application November 23, 1953, Serial No. 393,910
5 Claims. (Cl. 81—38)

1. A vise comprising a body, a fixed jaw fixedly mounted to said body, a sliding jaw mounted for movement towards and away from said fixed jaw along said body, a lead screw journaled in said body and engaging a nut in said sliding jaw whereby movement of said sliding jaw may be effected, a pair of laterally spaced holders on the confronting face of at least one of said jaws, a locator mounted in each holder for longitudinal sliding motion, a rocker on said jaw rearwardly of said locators and being centrally pivoted, the rear faces of said locators abutting against said rocker on opposite sides of said pivot.

---



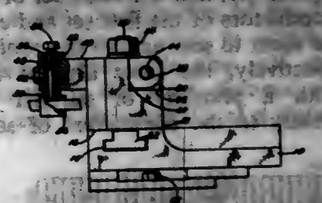
2,771,894
PREDETERMINED TORQUE RELEASE WRENCH
Bernard R. Better and John W. Lohde, Jr., Chicago, Ill., assignors to Scully-Jones and Company, Chicago, Ill., a corporation of Illinois
Application May 9, 1955, Serial No. 506,709
5 Claims. (Cl. 81—52.4)

1. In a nut setter, the combination of a driving member having a tapered bore, a driven member mounted in said driving member and having a tapered portion opposed to the tapered bore and having a plurality of longitudinal evenly spaced cams on the tapered portion with non-driving areas between the cams, a roller cage, rollers in said cage for engagement with said tapered and cam surfaces, means for adjusting the driven member axially with respect to the driving member for increasing or decreasing the driving torque, and means for connecting the driven member to the nut to be set.

2,771,895
STUD LOOSENING AND TIGHTENING TOOL
James C. Jacobsen, Redwood City, Calif., assignor to United Air Lines, Inc., Chicago, Ill., a corporation of Delaware
Application September 8, 1955, Serial No. 533,088
4 Claims. (Cl. 81—53)

1. A stud loosening and tightening tool comprising a slender housing provided with an elongated first cavity open at one end to accommodate the protruding end of a stud and an elongated second cavity arranged in spaced substantially parallel relation therewith and having an end thereof opening in substantially the opposite direction from the open end of said first cavity, the spacing between said cavities being such that a segment of each of said cavities is in overlapping relation with respect to one another, an elongated pawl having a portion thereof removably mounted within said second cavity for turning relative thereto about the longitudinal axis of said second cavity, said pawl portion being longitudinally grooved to form a pair of spaced sharp edge shoulders, only one of which protrudes into the interior of said first cavity upon relative turning of said pawl in one direction, and a pair of relatively spaced stop means mounted in fixed relation on said housing adjacent the open end of said second cavity and accommodating a portion of said pawl therebetween, said stop means being separately engageable by said pawl portion to limit the relative turning movement of said pawl to within a predetermined sector.

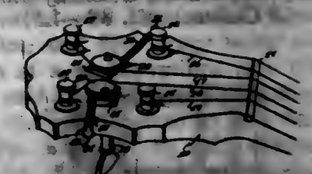
---



2,771,896
SCREW-CUTTING LATHES
Benjamin John Farrow, Cranborne, Wimborne, England
Application February 11, 1954, Serial No. 409,622
Claims priority, application Great Britain February 11, 1953
2 Claims. (Cl. 82—24)

1. Apparatus for use with a lathe comprising a tool carrying cross-slide, a manually operated rotary screw member for moving the cross-slide to adjust depth of cut, a rotary disc member rotatable in both directions without limit and locatable in a definite rotary position with reference to the screw member co-axially therewith, a detent device acting between said rotary disc member and the cross-slide to locate the rotary disc member in any of a large number of rotary positions, whereby the operator can move said rotary disc member by hand to cause movement relative to said screw member and relative movement in said detent device to set said disc member; an abutment attached to said screw member, and a stop pivotally mounted on said plate and adapted to be moved around its pivot into the path of said abutment.

---



2,771,897
TOOL HOLDER
Dallas R. Trimble, Cincinnati, Ohio, assignor to The Monarch Machine Tool Company, a corporation of Ohio
Application January 22, 1953, Serial No. 336,355
1 Claim. (Cl. 82—36)

An implement holder for a machine tool having a work area, said implement holder comprising a base member adapted to be secured to the machine tool, walls in said base member defining a slot having a bottom, an open top and at least one open end, said open end being directable toward said work area, a pin mounted in one of said walls adjacent the end opposite said open end and positioned substantially perpendicularly to said one of said walls, said pin projecting away from said one of said walls toward said other wall, an elongated bar lying in said slot and being embraced by the walls thereof and resting on the bottom thereof having one end projecting beyond said open end, means on said open end for mounting a tool implement, walls in the other end of the bar defining a bore therethrough, said bore embracing said pin, the other wall defining said slot being sufficiently relieved adjacent said free projecting end of said pin, whereby when said bar is pivoted about said pin out of said slot it will provide clearance so that the other end of said bar may be translated off the end of said pin through the relieved portion of said other wall.

2,771,898
BANJO TUNING DEVICE
George Jenkins, Jr., Liberty, N. C.
Application December 6, 1955, Serial No. 551,359
2 Claims. (Cl. 84—304)

1. A banjo of the type including playable strings, a tuning mechanism comprising a rotatable shaft mounted in the neck of said banjo, a cam engaging one of said strings and mounted on an end of said shaft, a stop mounted on said banjo engaging said cam limiting the movement of said cam in one direction, an adjustable stop on said banjo limiting the movement of said cam in the opposite direction, means for oscillating said cam between said stops, said bolt extending vertically through said banjo neck and has an axial bore through which said shaft projects, a nut threaded on said bolt with said stop being formed in said nut and said adjustable stop being threadedly carried by said nut.

---

2,771,899
TUNE CARD AND INSTRUMENT USING SAME
Aaron Isaacson, Elgin, Ill.
Application April 30, 1954, Serial No. 426,747
11 Claims. (Cl. 84—477)

1. A tune card for a musical instrument of the type wherein a plurality of note indicators are energized in suc-

cession to indicate the notes to be played, the card being adapted to seat on a plurality of electrical contacts disposed in generally linear relation and divided into a first set symmetrical about a mid-point and connected to the note indicators, respectively, and a second set energized in sequence as the successive notes are played, the card comprising: an insulating sheet having a contact side with a first set of parallel conductors extending to both edges of the sheet and adapted to seat against the contacts of said first set, respectively, and a second set of conductors parallel to the conductors of the first set and extending to both edges of the sheet to seat against the contacts of said second set, respectively, the sheet also having a non-contact side with a plurality of parallel conductors oriented transversely to the conductors of said first set

and at least equal in number to the number of said first set of conductors; conductor means extending through the sheet and connecting each of said last mentioned conductors to one of said first set of conductors, whereby in use each of said last mentioned conductors is connected to one of said indicators; and conductor means extending through said sheet connecting each of said second set of conductors to at least one of said last mentioned conductors, said last conductor means being in two sequences, one sequence being positioned to indicate a tune when the card is seated with one edge on the contacts and the other sequence being positioned to indicate a compatible tune when the card is seated with the other edge on the contacts, the conductors of the second set being interrupted where they extend between said last conductor means.

**REVERSIBLE VIEWFINDER FOR PHOTOGRAPHIC CAMERAS**

Richard Seemer and Richard Hofmeister, Braunschweig-Gliesmarode, Germany, assignors to Voigtländer, A. G., Braunschweig, Germany, a corporation of Germany

Application September 17, 1954, Serial No. 456,689

Claims priority, application Germany March 27, 1954

3 Claims. (Cl. 88—1.5)

1. Reversible viewfinder for photographic cameras provided with interchangeable objectives having varying focal lengths, said viewfinder comprising a casing provided with at least one lens system, said casing being rotatably arranged about a pivot which is perpendicular to the optical axis of the finder, said pivot being fastened in a slip-on member adapted to be applied to the camera; the viewfinder being capable of being used from either end, whereby the finder shows in one direction a first field of view which corresponds to the field of view of a first interchangeable camera objective of predetermined focal length and shows in a direction reversed by 180° a second field of view which corresponds to the field of view of a second interchangeable camera objective of predetermined focal length; the fields of view being inclosed by finder masks which are firmly built in in said casing; a cap provided with a viewing window, said cap being fastened to said slip-on member, said cap being tiltable about an axis which is perpendicular to said pivot and being urged to constantly lie against the finder casing, by the action of a torsion spring, said cap partially overlapping the finder casing and preventing its reversal in this position, while permitting reversal of the finder casing upon swinging aside the cap from the finder casing.

2,771,811

**LAUNCHER**

Charles C. Lauritsen, Pasadena, Calif., assignor to the United States of America as represented by the Secretary of the Navy

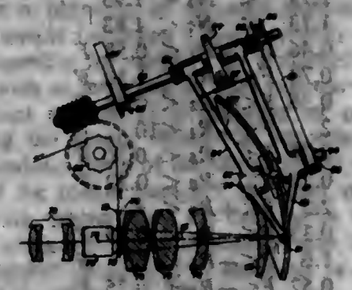
Application August 25, 1945, Serial No. 612,607

3 Claims. (Cl. 89—1.7)

1. A rocket launcher comprising a supporting post, a sleeve rotatably mounted upon the upper end portion of said post, a T fitting secured to the upper end portion of said sleeve, a hollow and laterally extending launching rail supporting shaft rotatably carried within said T fitting, a depending lever arm secured to said supporting shaft, a rearwardly extending handle, means for journalling said handle to said lever arm, a quadrant secured to the side of said sleeve and having portions thereof defining an arcuate guide slot and arcuately arranged apertures, a guide pin and a latch member carried by said lever arm and respectively engageable with said guide slot and apertures, resilient means for urging said latch member into said apertures to latch the launcher rails in various positions of elevation, mating and serrated flanges respectively secured to the upper end portion and lower end portion of said sleeve, a pivotally mounted train latch member, resilient means for urging said train latch member into mating serrations of said mating flanges, a cable operatively connected at one end thereof to said train latch member and carried within said handle, a grip member pivotally mounted on the outer end portion of said handle and operatively connected to the other end of said cable, and a pair of substantially I-shaped launching rails, the upper and lower flange portions of each of said rails defining tubular portions of triangular cross sections, and each of said tubular portions defining a slot in the outermost tubular wall thereof for the accommodation of a launching lug of each rocket to be launched.

---

2,771,812



**APPARATUS FOR CONTINUOUS MOTION PICTURE PROJECTION**

Joseph Mihalyi, Rochester, N. Y., assignor to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey

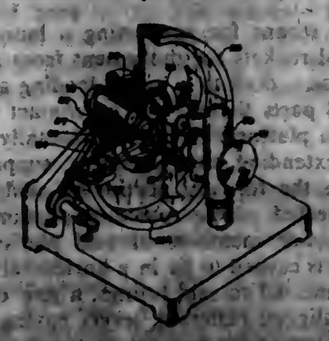
Application September 5, 1952, Serial No. 308,667

2 Claims. (Cl. 88—16.8)

2. A continuous motion-picture projector comprising a film gate for exposing substantially two frames of a motion-picture film, means of illuminating the film gate, means for passing film through the film gate, an optical system including a mirror disk divided into two independently mounted halves for receiving light from the film gate and for reflecting it back in the same general direction and forming an image of the film gate laterally displaced from the apparent position of the film gate as viewed from the optical system, means for rotating the mirror disk around an axis in the plane of the axis of the optical system one complete revolution for each two frames advance of the film drive, one half of the mirror disk being mounted on a bearing behind the mirrors and the other half on a bearing in front of the mirrors and the optical beam striking the mirrors below the center of the disk, a pair of rocker arms for tilting the halves of the mirror disk, one arm being in front of and one behind the mirror disk and supporting the two bearings, said rocker arms being divided into two legs below the said bearings and said legs straddling the locus of the optical beam and being mounted to rock about an axis which is

substantially a chord of the mirror disk through the axis of the optical beam and perpendicular to the plane common to the mirror bearings and the optical axis, face cam means approximately in the plane of the mirror disk and means for rotating the cam means precisely in synchronism with the film drive, the upper ends of said rocker arms being spring-urged against the said cam means at two points such that the two halves of the mirror are rocked to and fro in opposite phase during each revolution of the mirror disk, each half of the mirror being tilted at a uniform speed in the apparent direction of travel of the film while intercepting any substantial part of the optical beam and being tilted in the opposite direction to return it to its initial angle of tilt while it is out of the optical beam, whereby the image of each frame of film advancing through the film gate is imaged at a fixed position and the image of each frame is superseded by the image of the succeeding frame.

---



2,771,813

**APPARATUS FOR CONTINUOUS MOTION PICTURE PROJECTION**

Joseph Mihalyi, Rochester, N. Y., assignor to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey

Application September 5, 1952, Serial No. 308,668

1 Claim. (Cl. 88—16.8)

A continuous motion picture projector comprising a film gate, means for illuminating the film gate, means for advancing film through the film gate, an optical system and an optical compensator [illegible]

jection objective adapted to project a relay image of the stationary image, in which the optical compensator comprises a rotationally and bilaterally symmetrical ring of from four to eight mirrors and means for rotating the ring in synchronism with the film advance, in which the optical system is axially optically aligned with an equatorial diameter of the ring and is adapted to present an image of the film gate to a spot on the ring the apparent position of said image as viewed from the ring being closer to the center of the ring than to the circumference thereof and a little to one side of the equatorial plane containing said diameter, and in which the center of curvature of a mirror occupying said spot on the ring is approximately at the same distance as the image of the film gate and is substantially at a distance

$$\frac{L'}{2 \sin \frac{180°}{N}}$$

from the center of the ring, where L' is the apparent distance from the center of one frame of the film to the next and N is the number of mirrors, whereby a stationary image of the moving film is formed at the other side of the equatorial plane.

2,771,814

**MULTIPLE MOTOR DRIVE FOR CAMERAS**

Warren E. Isom, West Collingswood, N. J., assignor to Radio Corporation of America, a corporation of Delaware

Application April 30, 1952, Serial No. 285,210

10 Claims. (Cl. 88—17)

1. A multiple motor drive system for advancing film, reeling said film, and driving a light-interrupting shutter comprising a film advancing mechanism, a first synchronous motor connected to said mechanism for advancing film, a light interrupting shutter, a second synchronous motor connected to said shutter for interrupting light through said film, said first motor being adapted to advance said film at a predetermined rate with respect to the rotation of said shutter by said second motor, a take-up film reel, a motor connected to said take-up reel for reeling said film advanced by said mechanism, a mechanical interlock unit including mechanical connecting means between said film advancing mechanism driven by said first motor and said shutter driven by said second motor to permit independent operation of said first and second motors within certain predetermined limits, a power supply for said motors, a circuit for each of said motors from said power supply, a switch controlled by said reel motor for connecting said second motor to said power supply over its respective circuit, and a switch controlled by said second motor for connecting said first mentioned motor to said power supply over its respective circuit.

2,771,815

**RECTIFIER FOR AIR PHOTOGRAPHS WITH NADIR DISTANCE KNOWN AS TO DIRECTION OR SIZE**

Umberto Nistri, Rome, Italy

Application June 1, 1953, Serial No. 358,897

Claims priority, application Italy June 20, 1952

4 Claims. (Cl. 88—24)

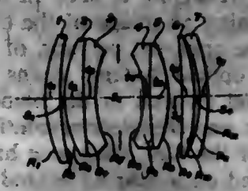
1. An apparatus for rectifying air photograms having an identifiable nadir point position, said apparatus com-

prising, a frame for holding an unrectified photogram, means mounting said frame for rotation about a central axis perpendicular thereto, an optical system to project light through said frame, said system including a lens, a second frame for holding a sensitized sheet on which

the rectified photogram is printed, a collimator, and means mounting said collimator on said first frame, said collimator including an optical system and a grid and being arranged to project the image of said grid onto the second frame independently of the projection of the unrectified photogram onto said second frame.

---

2,771,816
PORTABLE MICROFILM CAMERA
William A. Pfaff, East Norwalk, Conn., assignor to Diebold Incorporated, Canton, Ohio, a corporation of Ohio
Application August 11, 1951, Serial No. 241,418
9 Claims. (Cl. 88—24)



1. A camera having a casing having entrance and delivery openings through which a subject sheet of a size to be photographed may pass into the casing; means in the casing for illuminating a zone in the path of a sheet moving between said openings; means substantially in alignment with said entrance opening for propelling a subject sheet through the space between said openings and through said illuminated zone, said propelling means consisting of a single pair of cooperating feed shafts and spaced friction rollers carried on each of said shafts, said rollers being located between said entrance opening and the illuminated zone in close proximity to said zone; and means associated with said friction rollers for longitudinally bending the subject sheet as it passes between said rollers to produce corrugations to stiffen the sheet as it emerges from said rollers and cause it to pass through said illuminated zone without substantially drooping.

---

2,771,817
SEVEN-ELEMENT GAUSS TYPE OBJECTIVE COMPRISING TWO NEGATIVE MENISCUS COMPONENTS ENCLOSED BY TWO POSITIVE COMPONENTS
George H. Aklin, Rochester, N. Y., assignor to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey
Application March 31, 1955, Serial No. 498,148
2 Claims. (Cl. 88—57)

1. A seven-element photographic objective comprising the following four components: a front singlet, two inner cemented doublets and a rear slightly airspaced doublet, in which the refractive indices N of the lens elements, and the radii of curvature R of the lens sur-

faces, each numbered by subscript from front to rear are within the following limits:

$$1.70 < N_1 < 1.80$$
$$1.68 < N_2 < 1.78$$
$$1.57 < N_3 < 1.67$$
$$1.64 < N_4 < 1.74$$
$$1.83 < N_5 < 1.83$$
$$1.73 < N_6 < 1.93$$
$$1.73 < N_7 < 1.83$$
$$0.46\ F < +R_1 < 0.58\ F$$
$$0.74\ F < +R_2 < 1.10\ F$$
$$0.36\ F < +R_3 < 0.44\ F$$
$$2\ F < +R_4 < 10\ F$$
$$0.25\ F < +R_5 < 0.30\ F$$
$$0.27\ F < -R_6 < 0.32\ F$$
$$2.5\ F < +R_7 < \infty$$
$$0.33\ F < -R_8 < 0.39\ F$$
$$1.6\ F < -R_9 < 5\ F$$
$$0.52\ F < -R_{10} < 0.75\ F$$
$$0.40\ F < -R_{11} < 0.53\ F$$
$$0.52\ F < -R_{12} < 0.75\ F$$

where F is the focal length of the objective as a whole, and in which the thickness of each component is less than 0.14 F and the over-all length of the objective is between 0.46 F and 0.58 F.

---

2,771,818
ROCKET LAUNCHER
Charles C. Lauritsen, Pasadena, Calif., assignor to the United States of America as represented by the Secretary of the Navy
Continuation of application Serial No. 676,116, February 3, 1946. This application April 29, 1952, Serial No. 285,083
6 Claims. (Cl. 89—1.7)

1. Mount means for supporting a launcher assembly for elongated rockets for movement from a stowed position resting on a deck to a raised loading and firing position with all parts thereof out of contact with the deck comprising, a platform having horizontally disposed longitudinally extending side members, support mountings connected to the forward portion of said platform and fittings connected at the rearward portion of the platform to the side members of said platform such that the platform is caused to lie in a horizontal plane, latches pivotally connected to said fittings, a pair of transversely spaced and aligned bellcrank levers having L-shaped leg members connected for movement together and pivotally connected at the point of juncture of the legs of the L-shaped bellcrank to the platform support mountings for rotation in parallel vertical planes when the mount is moved from a stowed position to a firing position, one pair of upstanding bellcrank legs arranged to pivotally

engage opposite sides of a rocket launcher rail assembly near the center thereof to provide a trunnion therefor so as to permit movement of the rocket launcher rail assembly in elevation, said trunnion being located forward of the pivotal connection between the juncture point of the legs of the bellcrank levers and the platform support mountings when the rail assembly is in a stowed position and said trunnion being located above said pivotal connection between the juncture of the legs of the L-shaped bellcrank levers and the forward platform supporting mountings when the rail assembly is in firing position, the horizontal leg set of the L-shaped bellcrank extending to the rear and engaging the deck when the rocket launcher assembly is in the raised firing and loading position, said latches being provided for anchoring the latter legs to the deck during the rocket firing and loading operations, and means for locking the assembly in a plurality of elevated positions, said last-mentioned means including a link pivotally connected to said rail assembly for rotation in a vertical plane to be connected with at least one of said rearwardly extending bellcrank legs at one of a plurality of predetermined points along the length thereof in accordance with the desired elevation setting of the launcher rail assembly, the rear end of the rocket launcher assembly in the loading position being spaced from the deck so as to permit the loading of elongated rockets therein from the rear even while the rocket launcher rail assembly is in a position of extreme elevation.

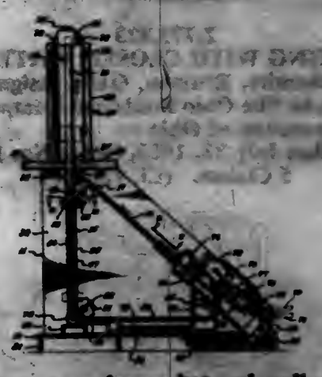
2,771,819
GAS-OPERATING FIREARM
Charles H. Morse, Herkimer, and Homer W. Young, Ilion, N. Y., assignors to Remington Arms Company, Inc., Bridgeport, Conn., a corporation of Delaware
Application October 12, 1953, Serial No. 385,428
6 Claims. (Cl. 89—191)

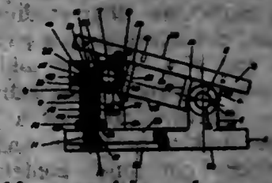
1. In a gas-operated firearm having a barrel, a receiver and a reciprocating breech bolt carrier housed therein, the combination comprising an orifice in the barrel, tubular means for conveying gas rearwardly from said orifice into said receiver, and a system of telescoping pistons within said receiver comprising a longitudinal bore with a closed rear end formed in said bolt carrier, an inner tubular piston affixed to said receiver in communication with said tubular means and extending rearwardly in axial alignment with said bore, said bore being telescoped over said inner tubular piston when the bolt carrier is in forward position, and an outer tubular piston mounted in said bore in the bolt carrier with capacity for limited forward extension relative to said bolt carrier, said outer tubular piston surrounding and being in telescoping relation to said inner tubular piston.



---

2,771,820
KEYWAY CUTTING MACHINE
John V. Meyers, Upland, and Alger W. Fellige, Pomona, Calif., assignors to Meyers-Fellige Company, Pomona, Calif., a partnership
Application September 15, 1953, Serial No. 380,296
6 Claims. (Cl. 90—43)

1. In a fluid operable keyway cutting machine, the combination of: frame [illegible] a ported work piece support and a [illegible] therebelow; laterally spaced vertical [illegible] the support and [illegible] with [illegible]



umns; cutter means carried by the cross head means between said guide columns and extending through said ported work support for cutting engagement with a workpiece supported thereby; means for reciprocally moving said crosshead means and said cutter means comprising a forwardly and upwardly inclined fluid operated piston means carried by the frame member rearwardly of the crosshead means and spaced therefrom; and a pair

of triangularly arranged sprocket and endless chain means disposed on opposite sides of the piston means and the crosshead means, each of said chain means having a portion lying in the plane defined by the axis of the cutter means and guide columns and connected to said crosshead means outwardly of the guide columns, and an inclined portion lying parallel to axis of the piston means, and yoke means connecting the piston means and the inclined portions of said chain means for causing axial movement of said cutter means.

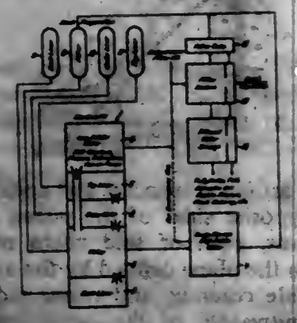
---

2,771,821
ANGULAR WORK TABLE
Andrew Bozich, Erie, Pa.
Application January 23, 1953, Serial No. 332,907
8 Claims. (Cl. 90—59)

1. A work table comprising a base, a table top swingably connected to said base, means to adjust the angularity of said table top with regard to said base, said means comprising a block swingably connected to said table top at a point spaced from said pivot point of said table top with said base, a screw threadably engaging said swinging block at one end therof and engaging said base at the other end thereof, said screw being hollow, and a stud extending through said base and into said hollow of said screw locking said table top to said base.

---

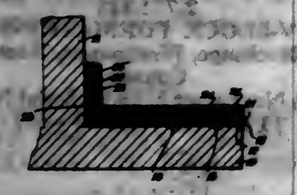
2,771,822
V-BLOCK FORMATIONS
Norman S. Blackaga, Westmount, Weston, Ontario, Canada
Application November 3, 1953, Serial No. 390,837
11 Claims. (Cl. 90—59)



1. A V-block comprising a member having an inclined face, a second member sliding on said inclined face and

presenting an inclined face forming with the aforesaid face a V, means to lock said members in desired relative positions, and clamp means having a clamping member and a support formation engaging and co-operating with the first-mentioned members to locate said clamping member opposite the apex of said V independent of the relative position of said first-mentioned members.

---



2,771,823
**PAPERMAKING WITH CLOSED WATER SYSTEM**
Edward L. Lehmbre, Rittman, Ohio, assignor, by mesne assignments, to The Ohio Boxboard Company, Rittman, Ohio, a corporation of Ohio
Application July 28, 1950, Serial No. 176,397
5 Claims. (Cl. 92—38)

1. In a paper making operation including the steps of forming a paper furnish comprising an aqueous slurry containing paper fibres, and passing such slurry to a paper web forming operation having as one result the discharge of water having a solids content including paper fibres, the method of treating such discharged water to remove therefrom its solids content and produce water reusable in the paper making operation, which comprises the steps of pumping and thereby establishing a pressure head in the said discharged water and passing it while maintaining such pressure head through a filter apparatus furnished with a particulate filter medium dissimilar to the paper fibres and not injurious to a paper web formed from such fibres and of a character and in an amount sufficient to remove from such water substantially all of its solids content, returning at least a portion of the filtrate to the paper making operation, and collecting and conserving the filtered-out solids content for reuse in the paper making operation, said filter medium being diatomaceous earth.

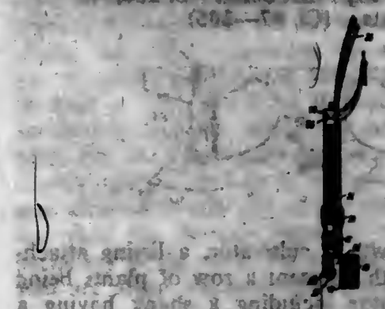
---

2,771,824
**COMPOSITE FLOOR AND DECK COVERING CONSTRUCTION**
Harold K. Patch, Hermosa Beach, and Richard J. Grundy, San Carlos, Calif., assignors to Crossfield Products Corporation, Los Angeles, Calif., a corporation of California
Application March 9, 1950, Serial No. 148,629
9 Claims. (Cl. 94—3)

1. A permanent, substantially monolithic floor and deck covering for use on a base support which is subject to relative movement of different portions thereof, said covering being formed and applied in situ, comprising a base support which may be subject to relative movement as between different portions thereof; a supporting layer of air- and liquid-pervious felt, means adhesively cementing said supporting felt layer to said base support at the periphery of said felt layer and additionally only at spots arranged on about 15 foot centers as measured from one another and from said periphery; a relatively thin coating applied as a plastic mass over said felt layer and having a composition, the essential active ingredients of which are rubber latex, vulcanizing constituents for said rubber latex, and an hydraulic cement; a relatively thicker layer of a rubber composition applied as a plastic mass over said thin coating and being substantially integrally bonded thereto throughout the entire surface to be covered, said relatively thicker layer having a composition, the essential active ingredients of which consist of rubber in the form of a latex and vulcanizing constituents for the rubber of this layer, and this relatively thicker layer serving to render the covering impervious to water; and a wear coat above and substantially integrally bonded to said relatively thicker layer, said wear coat being applied as a plastic mass and having a composition, the essential active ingredients of which consist of a rubber latex, vulcanizing constituents therefor, an hydraulic cement, and a solid mineral aggregate filler; whereby to provide a substantially rigid, floating floor covering of seamless monolithic character, which will be substantially unaffected by such relative movement of portions of the base support as may occur in normal use.

---

2,771,825
**LOCKING MEANS FOR THE BACK WALL OF ROLL FILM CAMERAS**
Helmut Naumann, Braunschweig, Germany, assignor to Voigtländer, A. G., Braunschweig, Germany, a corporation of Germany
Application December 9, 1952, Serial No. 324,975
Claims priority, application Germany December 15, 1951
3 Claims. (Cl. 95—31)

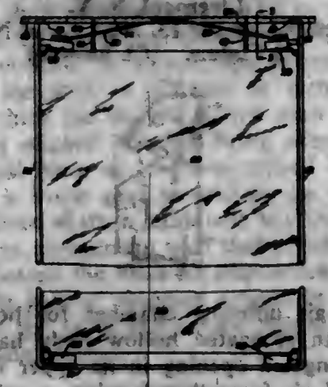


1. Means for preventing the inadvertent opening of the rear wall of a roll film camera adapted to receive a film extending between a film holder and a take-up spool within the camera, said means being arranged within the camera and comprising an elongated resilient member fastened to the body of said camera and provide with a contact portion adapted to engage a lateral portion of the film surface, said resilient member being effective at a right angle to the surface of film to urge said contact portion into engagement with the film surface, a stud carried on the inner surface of the camera rear wall, said resilient member having an aperture adapted to receive said stud, said resilient member being urged, upon contact with the film, into a position such that said stud is positioned in the aperture, said resilient member having an inclined flap adjacent the aperture to provide an abutting surface adjacent said stud.

---

2,771,826
**ADJUSTABLE CAMERA-SUPPORT**
David H. Slaughter, Forest Hills, N. Y.
Application January 28, 1955, Serial No. 483,031
3 Claims. (Cl. 95—86)

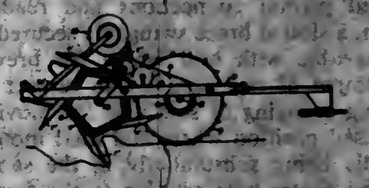
1. A camera support comprising two elongated plates in side-by-side relation and spaced apart with a bridge extending therebetween and joining the plates together at one of their adjacent longitudinal edges and midway between the ends thereof, the spaces between said plates at their opposite edge being open to receive therebetween a portion of a body encircling member, at least one of said elongated plates including corrugated friction material on the inner face thereof to engage the body encircling member and hold the camera support relative thereto, support means on the bridge, and a telescopic camera-support connected at one end with said support



means and extending upwardly therefrom, on the other end of which a camera is mounted for supporting the camera on the body encircling member.

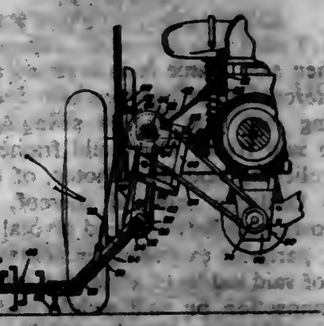
---

2,771,827
**X-RAY PROCESSING HANGER**
Henry J. Hood, Carl F. Nowack, and Edmund M. Van Hoesen, Rochester, N. Y., assignors to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey
Original application January 25, 1952, Serial No. 268,294. Divided and this application February 2, 1953, Serial No. 334,652
1 Claim. (Cl. 95—100)



A sheet film hanger comprising, in combination, a hollow rectangular frame, a pair of film clips fixedly secured to one side of said frame to engage adjacent corners of a film sheet, a pair of resilient cantilever members secured to the opposite side of said frame, film clips mounted directly on the free ends of said members to engage an opposite pair of corners of said sheet and to cooperate with said first pair of clips to maintain said sheet in a tensioned planar relation on said hanger, means fixedly positioned on said hanger and cooperating with said cantilever members to maintain the clips thereon in the plane of said sheet, but permitting limited movement of said member relative to said means in the plane of said sheet, and means on said last mentioned means adapted to be engaged by said cantilever members to limit the movement of the clips thereon in opposite directions in the plane of said sheet.

---

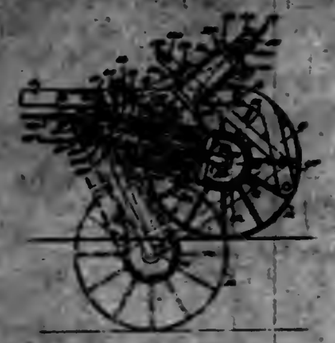


2,771,828
**FOREST CULTIVATOR**
Ivan Troeng and Georg Calles, Stockholm, Sweden
Application March 6, 1953, Serial No. 340,704
Claims priority, application Sweden March 7, 1952
4 Claims. (Cl. 97—49)

1. A cultivator comprising the combination with a supporting frame, a front traction wheel and a rear scratching member rotatably supported in said frame, said scratching member having a plurality of scratching claws movable through the ground and back through air to the ground on rotation of said scratching member, of motion-transmitting means coupling said traction wheel to said scratching member to rotate the latter in the same direction as said traction wheel and at a speed lower than that of the traction wheel and cyclically varying, with its minimum value of speed occurring when a claw is in its scratching position.

---

2,771,829
**ROTARY CULTIVATOR**
Olaf A. Sahlberg, Lake Stevens, Wash., assignor of fifty percent to Leo J. Beguet, Granite Falls, Wash.
Application February 18, 1954, Serial No. 411,099
1 Claim. (Cl. 97—49)

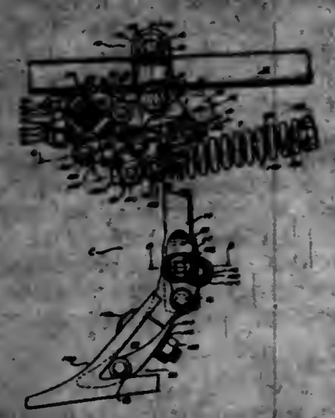


A tilling attachment for a tractor comprising a frame attachable to one side of a tractor to extend horizontally outwardly therefrom, a first cross shaft journaled in said frame and adapted to be connected to a power take-off of a tractor for drive by said power take-off, an upper elongated carriage pivoted on and suspended from said cross shaft for vertical swinging transversely of the tractor and having a second cross shaft journaled therein below said first cross shaft, driving connections from the first to the second cross shafts, a lower elongated carriage depending from the second cross shaft and swingable upwardly and downwardly thereon and vertically with the first carriage, an elongated tilling head extending outwardly from the lower end of the second carriage for vertical swinging thereby and having a rotary operating shaft at an angle to the lower carriage, a drive shaft journaled in the lower carriage and having its axis coplanar therewith, said drive shaft being universally jointed to the operating shaft, gearing between the first cross shaft and the drive shaft, and levers pivotally attachable to a tractor and operatively connected to said carriages, respectively, for swinging said carriages independently.

---

2,771,830
**POWER OPERATED LIFT FOR AGRICULTURAL IMPLEMENT**
Bernard J. Schill, Rockford, Ill., assignor to J. I. Case Company, Racine, Wis., a corporation of Wisconsin
Application August 30, 1951, Serial No. 244,367
4 Claims. (Cl. 97—46.31)

1. For use with an implement having a supporting frame, and a U-shaped crank axle carried by the frame and swingable in a fore-and-aft direction for raising and lowering said frame, a lifting means including a saddle pivotally secured to said frame above said axle and swingable in a substantially fore-and-aft direction, a pivotal connection on said axle and a pivotal connection on said saddle above said frame in all operative



positions of said saddle, said saddle being swingable so as to move said pivotal connection on said saddle varying distances from the pivotal connection on said axle, an axially extensible fluid motor pivotally carried between said pivotal connections and readily detachable therefrom, a slotted brace swingably secured to said saddle and engageable with said frame for preventing swinging movement of said saddle with respect to said frame for causing swinging of said axle for moving said frame into a raised position when said fluid motor is actuated, said saddle being substantially in the same plane with or on dead center with relation to the force of the fluid

motor when said frame is in a raised position, and rigid means interconnected between said frame and said axle for locking said axle against swinging movement with respect to said frame when said frame is in raised position for relieving said fluid motor, of the weight of said frame to facilitate removal thereof, said fluid motor being repositioned between said pivotal connections in an extended, partially extended, or contracted condition by swinging of said saddle to adjust the distance between said pivotal connection on said saddle and the pivotal connection on said axle to be substantially equal to the length of said fluid motor.

2,771,831
SPRING-TRIP FOR CULTIVATOR SHOVELS
Henry C. Rodeghe, Moline, Ill., assignor to J. I. Case Company, Racine, Wis., a corporation of Wisconsin
Application September 25, 1952, Serial No. 311,485
5 Claims. (Cl. 97—47.58)

5. A cultivator for mounting on a bar, comprising a clamp having a forward and a rearward transverse pivot portion, a shank having the axis thereof offset transversely of said bar and rearwardly of said forward pivot portion, a pressure release means comprising a fore-and-aft arm clamped to said shank and having a transverse rectangular portion forwardly of said forward transverse pivot portion, a pivot clamp secured to said rectangular portion and pivoted in said forward pivot portion, said pivot clamp having a pivot bracket, and a toggle linkage pivoted at the extremities thereof to said pivot bracket and said rearward pivot portion.

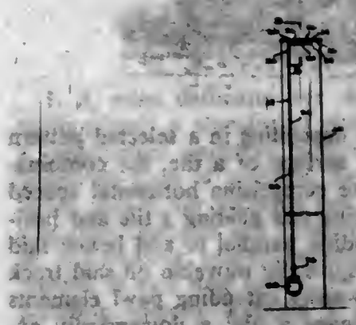
2,771,833
CULTIVATOR ATTACHMENT
Edward F. Duckett, Burlington, Tex.
Application May 21, 1953, Serial No. 356,544
2 Claims. (Cl. 97—208)

1. In combination with a cultivator, a listing attachment for directing earth adjacent a row of plants being cultivated, said cultivator including a shank having a shovel removably secured to the lower end thereof, said listing attachment being in the form of a blade including a transversely curved forward portion and a flat rearwardly and outwardly extending portion, said shovel including outwardly and rearwardly extending turning members having upper edges, said forward portion being disposed between an upper attaching portion of said shovel and said shank, said blade having a lower edge, said lower edge spaced to the rear and above the upper edge of one of said turning members.

---

2,771,833
HOT AIR BASEBOARD DIFFUSER
Donald D. Halliday, Fulton, and Edward P. Halliday, Liverpool, N. Y.
Application November 13, 1953, Serial No. 391,794
3 Claims. (Cl. 98—40)

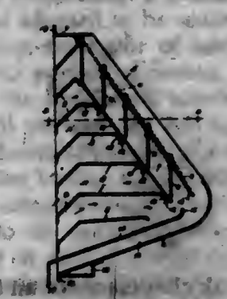
1. A hot air diffusing chamber for heating systems comprising an elongated hollow body having a longitudinally elongated opening in its upper front wall for the egress of air from the chamber, a collar extending downwardly from the bottom of the body adapted for connecting to a hot air duct, an upwardly and rearwardly sloping baffle in the body at the lower portion of the opening, an elongated damper, means swingably supporting one longitudinal edge portion of the damper internally of the body immediately above said opening and with the free longitudinal edge portion of the damper resting on the upper portion of the baffle to close the opening, and actuating means connected to the damper for raising the latter into an inclined position above the baffle for deflecting air through the opening in a downward direction when the damper is open.



---

2,771,834
SMOKE STACK COVER
Carl T. Gandy, Kokomo, Ind.
Application December 10, 1954, Serial No. 474,567
1 Claim. (Cl. 98—69)

A smoke stack cover comprising a flat lid adapted to overlie the top of a smoke stack in position covering the same, said lid in its stack-covering position lying in a horizontal plane; an arm secured fixedly to the lid and extending diametrically thereof, said arm having one end projecting radially, outwardly a substantial distance beyond the periphery of the lid, the arm including at the outer extremity of its projecting portion a depending, integral extension terminating at its lower end in a sleeve; a pair of brackets adapted for mounting upon said stack



below the cover, said brackets being disposed at opposite sides of said sleeve and being formed with bearing sleeves aligned coaxially with the sleeve of the extension; a shaft journaled horizontally in the sleeves of the brackets and passing through and fixedly secured to the first named sleeve, said shaft supporting the cover upon the bracket for rotational movement about the axis of the shaft through a 270° arc from its stack-covering position to an open position in which the cover depends vertically from the shaft inwardly of the shaft to be disposed in closely spaced relation to the side wall of the stack; a gear secured to one end of the shaft and having a radius less than the distance between the shaft axis and the periphery of the cover for swinging of the cover through said arc about the gear with the periphery of the cover

spaced from the gear periphery through the full range of movement of the cover between said positions thereof; an elongated shaft extending normally to the length of the first shaft and extending downwardly from the first shaft for disposition in closely spaced relation to the side wall of the stack; a plurality of vertically aligned bearings in which the second named shaft is journaled, said vertically aligned bearings being adapted for connection to said stack at locations spaced longitudinally of the stack; a worm gear secured to the upper end of the second named shaft in mesh with the first named gear and disposed in engagement with that portion of the first named gear nearest the stack for disposition of the worm gear out of the path of swinging movement of the cover; and means at the other end of the second named shaft for rotating the same.

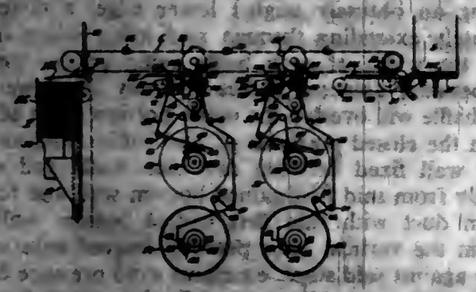
---

2,771,835
VENTILATING DEVICE, INCLUDING VENTILATING LOUVERS
Albert J. Weyse, San Antonio, Tex.
Application March 30, 1954, Serial No. 419,861
2 Claims. (Cl. 98—99)

1. A ventilator for mounting in an opening comprising a pair of vertical side walls of substantially triangular configuration with one edge substantially vertical and the other edges obliquely disposed, one of said other edges being a lower short edge inclined downwardly and outwardly toward said vertical edge, a downwardly and outwardly inclined bottom wall secured between said side walls, the inner end of said bottom wall being upwardly curved, a plurality of louvers fixed between said side walls, each louver being formed of a horizontal intermediate portion, a downwardly and outwardly inclined outer portion and a downwardly and inwardly inclined inner portion, said inner portion constituting a baffle stop, a plurality of baffles between said side walls, means swingably securing each baffle between said side walls in horizontally and vertically spaced relation from the means swingably securing the next adjacent baffle, each baffle including an obtusely angled lower edge, a connecting rod loosely extending through said lower edges of said baffles, the width of each baffle being greater than the space between adjacent baffles whereby the lower edge of one baffle will overlap the upper portion of an adjacent baffle in the closed positions of said baffles, and an inner bottom wall fixed between said side walls and spaced upwardly from said first named bottom wall and forming a return duct with said first named bottom wall, said baffles in the vertical open position thereof substantially bearing against said stops, excessive wind pressure flowing inwardly through said louvers effecting upward and inward swinging of said baffles to overlapping closed position.

---

2,771,836
CORN POPPING MACHINE
Lawrence C. Dunckle, Hayward, and John F. Shafer, San Francisco, Calif.
Application March 31, 1951, Serial No. 220,690
27 Claims. (Cl. 99—238.4)



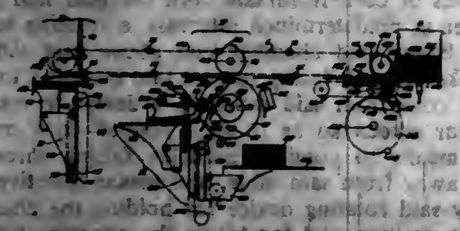
2. In a corn popping machine, a heated dispensing table, a compartment above said table, a substantially closed popping chamber in said compartment, a corn bin below said table, and means to transfer measured quantities of corn from said corn bin into said popping chamber at predetermined intervals, a rotating separator screen below said chamber and above said table with an intake opening facing toward said chamber to receive popped corn from said chamber, a device to rotate said separator screen so as to feed popped corn onto said table, means to conduct particles falling through the screen away from said table, and means selectively actuated by said rotating device for holding the chamber in popping position and for tilting the chamber for dumping the corn into said rotating screen, an agitating device in said chamber to agitate the corn therein, a drive connection between said agitating device and said screen rotating device, said screen rotating device being reversible, a connecting mechanism between said drive connection and said chamber, including a holding and tilting device for causing the chamber to move and to maintain said chamber in popping position during the rotation of said rotating device in one direction and to tilt said chamber toward said screen during the rotation of said rotating device in the reversed direction.

2,771,837

## HECTOGRAPHIC ADDRESS DUPLICATING MACHINE

Theodore A. Federwitz, Philadelphia, Pa., assignor to Scriptomatic, Inc., Philadelphia, Pa., a corporation of Pennsylvania

Application October 30, 1952, Serial No. 317,733
7 Claims. (Cl. 101—53)



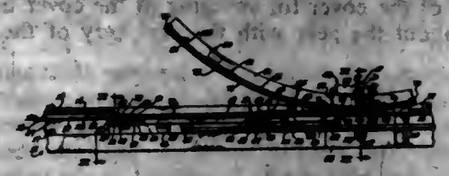
1. In a continuous automatic duplicator for transferring data from master cards to a strip, the combination with mechanism for moving the cards in succession through a pre-determined transfer station, of an oscillatory head constituting a support for said strip, take-up and supply reels for the strip supported independently of said head and operatively associated with the strip at opposite sides respectively of said head, means for oscillating the head to bring the strip intermittently into transfer relation to the cards at the said station, mechanism including feeding elements carried by the head for intermittently feeding the strip longitudinally through the head so as to present different areas of the strip to the cards for the respective transfer operations, and means responsive to the movements of the head in one direction only of its oscillatory movement for actuating said elements, said actuating means comprising a cam relatively fixed with respect to the head, a rotary actuator for the feeding elements carried by the head and in constant operating engagement with the cam whereby the cam operates to rotate the actuator in response to the oscillatory movement of the head, and means for rendering the cam inoperative to rotate the said actuator in one direction of the oscillatory movement of the head.

2,771,838

## FEEDING AND DELIVERING DEVICES IN HECTOGRAPHIC ADDRESS PRINTERS

Theodore A. Federwitz, Philadelphia, Pa., assignor to Business Systems, Inc., Philadelphia, Pa., a corporation of Pennsylvania

Application May 10, 1951, Serial No. 225,591
20 Claims. (Cl. 101—53)



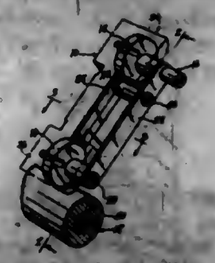
1. A continuous automatic duplicator for transferring data from a stack of master cards to copy sheets and the like, comprising a feed table for the master cards, a transfer station at which data on the cards are imprinted on the copy sheets, a stacker for receiving the cards after said sheets are imprinted, a pair of spaced endless conveyers for transporting master cards from the feed table through the transfer station and then delivering the cards to the stacker, means carried by said conveyers for gripping the cards continuously while being transported from the feed table through the transfer station, means for intermittently operating the conveyers, and means operative in timed relation with the conveyors and when the conveyors are stationary for feeding cards from the table to the card gripping means on the conveyers.

2,771,839

## APPARATUS FOR DEPOSITING ABRASIVE PARTICLES ON ARTICLES

Randall C. Rogers, Glendale, Calif., assignor to Gladding, McBean & Company, Los Angeles, Calif., a corporation of California

Application June 24, 1953, Serial No. 363,833
11 Claims. (Cl. 101—126)



1. In an apparatus for depositing in a selected pattern abrasive particles on the surface of a tile, the combination of: a frame structure comprising horizontal spaced parallel ways for supporting and guiding a tile and horizontal track means extending parallel to and below said ways; carriage means reciprocally movable on said track means and including upwardly extending pawl elements adapted to releasably engage a tile; a downwardly extending squeegee blade means pivotally carried by the frame structure above and adjacent a deposit zone; an open trough provided with a curved bottom wall having an opening and receiving the blade therewithin, said trough being adapted to carry a supply of abrasive particles; a screen extending across said opening and having a selected pattern; antifriction means carried by the frame structure for guiding and supporting said trough; cable means interconnecting said trough and said carriage for correlating movement of the trough and a tile advanced by the carriage whereby the opening is registered with the surface of an advancing tile in the deposit zone; and drive means for reciprocally moving the carriage along said track means whereby tile is intermittently and progressively advanced along said parallel ways and through the deposit zone.

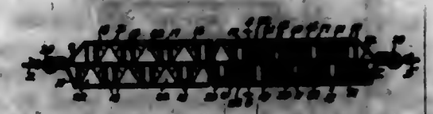
2,771,840

## STREAK ELIMINATOR FOR OFFSET DUPLICATING MACHINES

Herbert Jacobs, Brooklyn, Joseph Ricca, Elmhurst, and Paul Guglielmo, Brooklyn, N. Y.

Application February 16, 1955, Serial No. 488,542
3 Claims. (Cl. 101—425)

1. An ejector streak eliminator for an offset duplicating machine of the type including at least one pair of spaced ejection wheels connected by parallel slide arms; comprising a pad support including an intermediate portion, pad-engaging means at opposite ends of said portion, means on said portion for engaging the respective slide arms, and cleaning pads engaged by said pad-engaging means, said cleaning pads being adapted to contact said wheels, said pad-engaging means comprising flat heads integrally formed upon opposite ends of the intermediate portion, the pads being removably engaged by the heads, said heads



including parallel side flanges adapted to engage opposite sides of the pads, the slide-arm-engaging means comprising a pair of parallel ears integrally formed upon opposite sides of the intermediate portion.

2,771,841

## BELT LINE CHARGE

Anthony J. De Fino, Buffalo, N. Y., assignor to the United States of America as represented by the Secretary of War

Application August 15, 1947, Serial No. 768,791
2 Claims. (Cl. 102—22)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. A mine detonator for detonating substantially simultaneously a plurality of explosive charges comprising a longitudinal partition formed of flexible material, an elongated strip of webbing formed of said flexible material, means for securing one side of said partition to said strip centrally and longitudinally thereof, a plurality of transversely spaced partitions fastened at one end thereof to said strip and at the other end thereof to said partition thereby forming a plurality of pockets, one pocket overlapping two pockets on the opposite side of said partition by an amount sufficient to maintain overlap thereof during stretched conditions of said flexible material, a formed, detonating explosive charge substantially filling each of said pockets, means for providing hollow gaps between adjacent explosive charges on each side of said partition to increase the flexibility of said mine detonator, and means for securing the longitudinal edges of said strip to the other side of said partition.

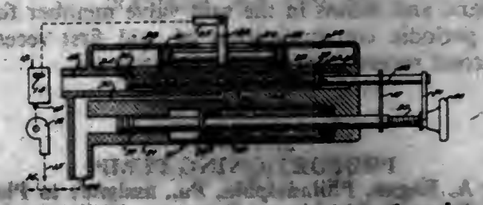
2,771,842

## TOGGLE CLAMP FIN RETAINING BAND

Willy Hillquist, Pasadena, Calif.

Application August 21, 1953, Serial No. 375,847
3 Claims. (Cl. 102—50)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. In a rocket of the type having a cylindrical casing, the combination comprising; a plurality of angularly disposed paired fins adapted to be secured to the outer surface of the casing, each pair of said fins having a connecting cylindrical portion extending in a circumferential direction about the casing and outwardly ranging fins at each end of said portion and having slots in the zones between said cylindrical portion and said outwardly ranging fins, each slot having an opening at the end of the pair of fins, a circumferentially extending fin retaining band adapted to be passed through the slot openings and be disposed in said slots and engaging said arcuate portions for securing said paired fins to the outer surface of said casing, a toggle device comprising a first bent wire member having a portion pivotally connected to one end of said band, a second bent resilient wire member having a portion pivotally connected to the other end of said band and having looped portions intermediate its ends at opposite sides of the band pivotally connected to the free ends of said first member, intermediate portions of the second member contacting each other and crossing the [illegible] ends of said second member adapted to [illegible] beneath said band, the construction and



arrangement being such that rotation of said second member toggles the first member to locked position and its free ends, when sprung beneath the band, prevent unauthorized retrograde movement of the toggle device from its locked position.

2,771,843

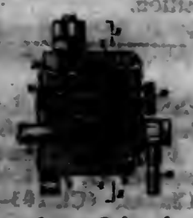
## PRESSURE REGULATOR

Gordon H. Brown, Detroit, Mich., assignor to Earl A. Peterman

Application December 13, 1951, Serial No. 261,412
2 Claims. (Cl. 103—17)

1. In a pressure regulator, a unitary housing, a first member comprising a sensing rod supported for axial movement within said housing and extending from one end thereof, a spring urging said sensing rod toward the other end of said housing, a piston at the inner end of said sensing rod, a port at said other end of the housing connected to said piston, said port being adapted for connection to the delivery side of a pump, a second member comprising a spool valve slidably mounted in a bore in said housing parallel to said sensing rod and extending from said one end of the housing, a connecting element having one end fixedly secured to one of said members outside of said housing and extending toward said other member, a threaded portion on the other member, a rotatable handle threadably mounted on said threaded portion, a connection between said handle and the other end of said connecting element, whereby said first and second members are secured together for movement in unison and are axially adjustable relative to each other, and actuating member slidably mounted within said housing parallel to said first and second members, a pair of piston heads at opposite ends of said actuating member, a pair of chambers formed in said housing within which said piston heads are disposed, a pair of ports connecting said chambers to said valve bore, a connection in said housing from said pump delivery port to said valve bore between said first two connections, connections from the opposite ends of said valve bore to the atmosphere, said valve being movable in response to changes in fluid pressure exerted on said sensing rod from a neutral position in which said pair of ports are closed, in either direction to a position connecting one of said pair of ports to pump delivery pressure and the other port to atmosphere, and means adapted to connect said actuating member to a power-controlling portion of a prime mover.

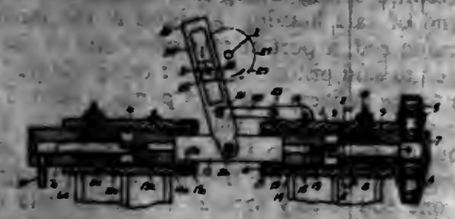
2,771,844



## METHOD AND APPARATUS FOR THE DELIVERY OF GEAR PUMPS

Johann Lipinski, Floridsdorf, near Vienna, Austria, assignor to Alex. Friedmann, Kommanditgesellschaft, Vienna, Austria

Application August 5, 1954, Serial No. 448,816
Claims priority, application Austria August 11, 1953
13 Claims. (Cl. 103—41)



1. In a device for controlling the delivery of a gear pump including a casing, a working chamber and two pump gears therein, said working chamber having a pump discharge space, a delivery passage and a return passage separated from the delivery passage in the casing, a cylindrical bore, the said cylindrical bore having a first recess in communication with said delivery passage and having a second recess in communication with said return pas-

sage spaced axially from the first recess, a rotary and axially movable valve member having a cylindrical surface within said cylindrical bore, the valve member operatively connected to and revolving in timed relation with said gears, and means in the said valve member for providing periodic communication of said first recess and said second recess with said discharge space.

---

2,771,845
PROPORTIONING PUMP
Joseph A. Engas, Philadelphia, Pa., assignor to Philadelphia Pump & Machinery Company, Philadelphia, Pa., a corporation of Delaware
Application January 11, 1955, Serial No. 481,139
2 Claims. (Cl. 103—153)

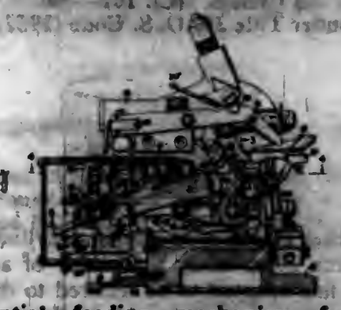
1. In a pump, a pump body, a cylinder in one end of the body having intake and discharge valves at one end of the cylinder, a packing within the body at the other end of the cylinder having a gland for tightening the packing, a piston having one end slidable through the packing into the cylinder, a cross head fixed to the other end of the piston, a cross head guide sleeve having one end engaging said gland, said pump body having a bore concentric with the cylinder in which the crosshead guide sleeve is slidable, and another sleeve threaded on the body and engaging the other end of the cross head guide sleeve to force the guide against the gland and tighten the packing.

---

2,771,846
VARIABLE-CAPACITY METERING PUMP
Donelson B. Horton and Douglas Johnston, Huntsville, Ala., assignors to John Blue Company, Incorporated, Huntsville, Ala., a corporation of Alabama
Application May 17, 1954, Serial No. 430,087
4 Claims. (Cl. 103—203)

1. A pump for accurately metering a pressurized normally-gaseous liquid comprising: means defining an expansible pumping chamber having an inlet and an outlet; an inlet check valve and an outlet check valve controlling said inlet and said outlet, respectively; means operable by fluid pressure for loading said outlet check valve independently of the discharge from said outlet; conduit means for supplying said fluid pressure operable means with pressure fluid from the source of the pressurized liquid being pumped; and manually-operable means having a lost-motion connection with said outlet check valve for opening the latter to purge said pumping chamber, said manually-operable means being normally at rest during movements of said outlet check valve occasioned by metering operation of said pump.

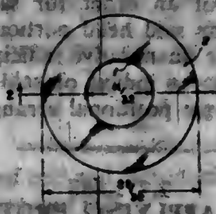
---



2,771,847
REFUSE DESTRUCTOR
Francis C. Holbrook, Brooklyn, N. Y.
Application March 16, 1953, Serial No. 149,991
6 Claims. (Cl. 110—15)

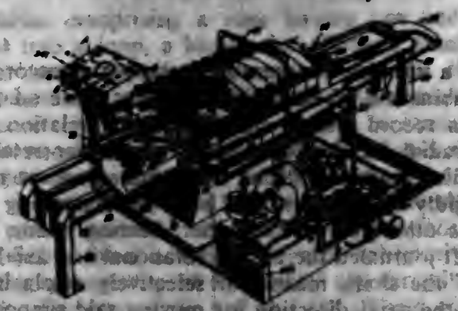
1. In an incinerator for continuous burning of raw refuse, a horizontally disposed furnace chamber having a single feeding means at one end to introduce all material including said raw refuse to be burned and outlet means for all of the volatile products of combustion at the other end, means in the chamber to move refuse continuously away from the feeding means toward said outlet means in one direction concurrent with the flow of gases, said chamber having a substantially flat heat-reflecting arch above said refuse moving means inclined angularly upwardly in the direction of movement of the refuse to radiate heat to dry and to support self-combustion of said refuse, said furnace chamber being provided with inlet ports disposed at the sides and bottom of said refuse feeding means to introduce air into the interior of the refuse being fed.

---



2,771,848
FEEDING MECHANISMS FOR SEWING MACHINES
Nicholaus Kness, Cranford, and Agnes G. Millington, Clifton, N. J., assignors to The Singer Manufacturing Company, Elizabeth, N. J., a corporation of New Jersey
Application September 14, 1954, Serial No. 455,966
7 Claims. (Cl. 112—209)

1. Differential feeding mechanism for a sewing machine, comprising, a main rotary shaft, a plurality of eccentric elements carried upon said shaft, a pair of feed-dog carriers supported for oscillatory and reciprocatory movement with each carrier embracing an eccentric element so as to be oscillated thereby, a pitman having one end thereof embracing one of said eccentric elements and its other end connected directly with a first of said carriers for imparting reciprocatory movement thereto, a rocker pivotally mounted about a fixed axis, means pivotally connecting one of said eccentric elements with said rocker thereby to oscillate said rocker about its axis, means separate from said last mentioned means slidably connected with said rocker and pivotally connected with the second of said carriers for imparting reciprocating movements to such carrier, and manually operable means for shifting the slidable connection between said last mentioned means and said rocker thereby to vary the amplitude of reciprocatory movement imparted to said second carrier by said rocker.



2,771,849
UNIVERSAL BOBBIN FOR ROTARY, DOMESTIC SEWING MACHINES
Louise Galbreath, Leesburg, Fla.
Application June 20, 1956, Serial No. 592,681
16 Claims. (Cl. 112—251)

1. A bobbin for rotary, domestic sewing machines characterized by a core and two substantially flat, circular end discs arising from the periphery of the core, the size of these parts being fixed in the following particulars: the length of the core substantially exactly 9/32 of an inch and its inside diameter substantially exactly 11/32 of an inch, and the outside diameter of the two end discs substantially exactly 25/32 of an inch, the aforesaid parts being made from a member of the group consisting of plastics and light metals.

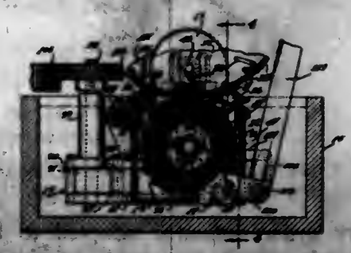
---

2,771,850
HIGH-PRESSURE HYDRAULIC PRESS
Orville A. Wheeler, Pacific Palisades, Calif., assignor to Douglas Aircraft Company, Inc., Santa Monica, Calif.
Application March 11, 1952, Serial No. 275,893
21 Claims. (Cl. 113—44)

14. In apparatus of the type described and including a tubular outer shell open on at least one end face thereof: cylindric members, each having a concave, inner face, arranged coaxially of said tubular member with their peripheries in radical adjacency to the inner wall of said tubular member and with the concavities mutually confronting so as to define an inner shell including a longitudinally extending working chamber; pressure-generating work forming means disposed in said working chamber and applying radially outwardly directed forces transversely of the cylindric members when said apparatus is work-formingly operated; and surfaces located in the peripheral marginal region of each of said cylindric members and adapted to move apart under the radially outward and circumferentially directed actions of the forces generated by actuation of said pressure-generating means, thereby to dissipate said forces harmlessly.

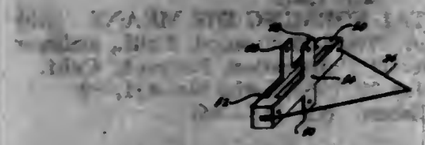
15. Apparatus for conforming sheet material to predetermined shapes on form-means, comprising: a substantially hollow body having a first major interior surface-portion and a second major interior surface-portion, said portions being arranged in opposed spaced relation in generally horizontal planes; pressurally distortable, pressure-applying means disposed in said body adjacent to said first surface-portion; means for pressurally forcing said distortable means toward said second surface-portion in a working movement; an opening extending from the interior of said body through a side wall thereof and forming an access passage in a generally horizontal plane; and carrier means movable through said opening into and out of the interior of said body to carry sheet material on form-means into workable adjacency with said distortable means; said apparatus including means cooperating with said carrier means to prevent dislodgement of the latter and to maintain said sheet material and form-means in optimum working position during the conforming operation of the apparatus.

---



2,771,851
SHEET METAL FORMING DIE MEANS
Clifton P. McGregor, North Hollywood, Calif., assignor to Lockheed Aircraft Corporation, Burbank, Calif.
Application May 20, 1954, Serial No. 431,090
5 Claims. (Cl. 113—46)

1. Die means for forming sheet material comprising, in combination, a die having a cavity and a surface around the cavity adapted to support a sheet material part, an actuating hammer movable toward the die, a punch on the hammer movable against the part to draw the same into the cavity, a ring of compressible material around the punch and engageable with the portion of the part resting on said surface, the material of the ring having a Shore hardness of between 80 and 100 on the A scale, and yieldable means engaged between the hammer and the ring transmitting said movement of the hammer to the ring to cause the ring to clamp said portion against said surface prior to and during the engagement of the punch with the part to control said drawing of the part.

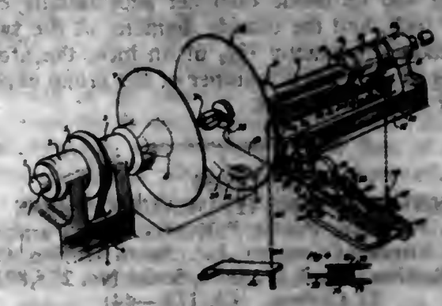


---

2,771,852
SOLDERING MACHINE
Frank B. Hee, Lumberton, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application November 1, 1955, Serial No. 544,229
6 Claims. (Cl. 113—59)

1. In a machine for applying solder to a surface of a sheet material, a container for molten solder, a hollow perforated spindle, means rotatably supporting said spindle in said container, means for rotating said spindle, a rotary brush carried on said spindle, means for controlling the solder level in said container whereby only a small portion of the peripheral surface of said rotary brush is exposed, means for engaging the exposed portion of said brush with a surface of said sheet, a solder reservoir, means for forcing solder from said reservoir into said hollow spindle whereby solder is forced outwardly through the said brush, means for directing the surface flow of solder in said container across the exposed surface of said brush whereby surface contamination of said solder is carried away from said brush, and means for directing the surface flow of solder in said container out of said container to said reservoir.

2,771,853
MULTIPLYING LEVER
Raymond R. Grant, Los Angeles, Calif., assignor to Douglas Aircraft Company, Culver City, Calif., a corporation of Delaware
Continuation of application Serial No. 327,555, December 23, 1952, now Patent No. 2,723,565, dated November 15, 1955. This application August 29, 1955, Serial No. 531,122
1 Claim. (Cl. 116—114)

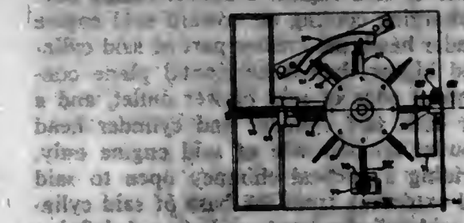


A multiplying lever comprising, in combination, a rigid I-beam member having a narrow, elongated web portion extending between a pair of relatively wide flanges, a pair of flexible elements affixed at their ends to said flanges and parallelly extending between said flanges on opposite sides of said web portion, a pointer element secured at two points to said flanges and having an intermediate pointed portion extending at right angles to one of said flexible elements, said one of said flexible elements being adapted for connection intermediate its ends to a movable structure and the other of said flexible elements being adapted to be secured intermediate its ends to a reference structure, said flexible elements distorting upon motion of said movable structure to permit rotation of said I-beam member about its longitudinal axis, said pointer being moved by said rotating I-beam member in a plane parallel to the plane of movement of said movable structure and through a distance to magnify the movement of said movable structure.

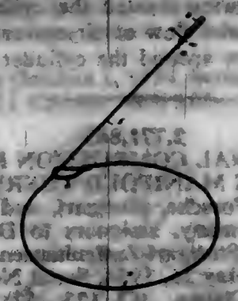
2,771,854
DAIRY ORDER INDICATOR
Fred M. Crenshawett, San Francisco, Calif., assignor to H. S. Crocker Company, Inc., San Francisco, Calif., a corporation of California
Application December 13, 1952, Serial No. 552,816
9 Claims. (Cl. 116—133)

1. A dairy order indicator adapted to be supported adjacent a bottle mouth, a plurality of elongated flags, a carrier for said flags having a shank portion insertable within a bottle mouth and having an enlarged head portion provided with an eccentrically arcuate periphery, said flags having common ends thereof jointly pivotally attached to said head portion at the reverse side of said head portion, with the location of the point of pivotal attachment and the shape of said arcuate periphery being such that as any given flag is pivotally moved about said periphery in one direction a progressively greater amount of said flag is hidden by said head portion and such that as said flag is pivotally moved about said periphery in the other direction a progressively lesser amount of said flag is hidden by said head portion, quantitative measure indicia on the obverse side of said head portion selectively located around said periphery, quantitative measure indicia eccentrically arcuately displayed on the obverse sides of said flags in the intermediate areas thereof which are selectively hidable and discloseable with respect to said head portion, and product species indicia on the permanently disclosed outer ends of the obverse sides of said flags, said overall indicia arrangement being such that when the flag for a given product species is brought into radial registry with a given indicia on said head portion the existence of an order for said species in the quantity indicated by said head portion indicia is established only when the quantitative indicia on said flag corresponds with said given indicia on said head portion and is in margin to margin positional arrangement therewith.

2,771,855
MACHINE FOR APPLYING PROTECTIVE COATINGS TO THE MARGINAL PORTIONS OF GRAMOPHONE DISCS
Thorwald Georg Gunnar Thorvaldson, Stockholm, Sweden
Application March 5, 1954, Serial No. 414,405
3 Claims. (Cl. 118—232)

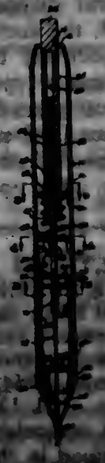


1. In a machine for treating gramophone record discs; the combination of an annular support plate adapted to receive a record disc in closely abutting relation to one of the radial faces of said plate, means for retaining a record disc against said one face of the support plate, a shaft rigidly connected to said plate and extending axially from the other face of the latter, bearing means having said shaft journaled therein for rotational and axial movement of the shaft, means for selectively displacing said shaft in the axial direction for moving said support plate between first and second axially spaced apart positions, drive means engageable with said support plate only at said first position of the latter to there rotate the support plate at a relatively slow rotational speed, a rotary dispensing roller adjacent said first position of the support plate and movable toward and away from the latter in the radial plane of the support plate for applying a protective coating to a record disc held against said support plate at said first position, means for displacing said dispensing roller in said radial plane to engage and release the edge of a record disc, an annular drive plate rotatably mounted adjacent said second position of the support plate coaxially with the latter to frictionally engage a record disc held against said support plate when the latter is moved to said second position, and means rotating said drive plate at a relatively high rotational speed so that a record disc held against said support plate and frictionally engaged by said drive plate will be rotated by the latter at a speed suitable for the grinding of the edge and marginal portions of the record disc.

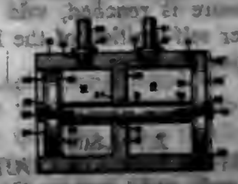


2,771,856
COIL FILAMENT COATING MACHINE
Joseph R. Ardizzone, Newark, and James M. Harper, East Orange, N. J., assignors to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application September 30, 1953, Serial No. 383,265
6 Claims. (Cl. 118—405)

1. A coil waxing machine comprising means for gripping a coil intermediate of the ends thereof, a pan located beneath a position of said coil while gripped by said means, and automatic mechanism for manipulating said gripping means and coil and introducing both ends of the coil successively into said pan.



2,771,857
SPINNING ROPE WITH SWIVELED HANDLE
George L. Seaghen, Chicago, Ill.
Application January 6, 1955, Serial No. 480,138
1 Claim. (Cl. 119—153)



A lariat comprising a rope having one end thereof formed into a loop, a handle for effecting manipulation of said lariat, a swivel connection between the other end of said rope and handle, comprising a shank having a reduced end, fitted in said handle, a semi-spherical member mounted on said reduced end of said shank, an elongated sleeve connected with the end of the rope opposite to said loop, said semi-spherical member being fitted within one end of said sleeve, portions of said sleeve being fitted around said semi-spherical member providing an opening of a diameter substantially greater than the diameter of the reduced end of said shank, and through which the reduced end of the shank extends, providing a controlled universal swivel movement between said sleeve and semi-spherical member.

2,771,858
MECHANICAL PENCIL HAVING A PUSH BUTTON, STEP BY STEP FEED
Francis J. Cribbs and Thomas J. Cribbs, Poyntelle, Pa.
Application September 9, 1955, Serial No. 533,384
1 Claim. (Cl. 120—17)

A mechanical pencil comprising a barrel, an axially recessed plunger extending axially of and within the barrel, said plunger being shiftable within the barrel in an axial direction and having one end projecting exteriorly of the barrel to provide a button depressible by a user; resilient, yielding means engaged between the barrel and plunger tensioned to normally bias the plunger in a direction to extend the same out of the barrel; a rack slidably mounted within the axial recess of the plunger, said plunger and rack being rotatable relative to each other; an advancing pawl carried by the plunger and engaging the rack to advance the same within the barrel responsive to depression of said button, rotatable movement of the plunger following advancement of the rack being adapted to free the plunger for return movement under the pressure of said means; a holding pawl carried by the barrel disposed to engage the rack in selected positions to which the same is advanced, to hold the rack against retrograde movement; a pencil lead carried by the rack and projecting exteriorly of the barrel, for extension of said lead out of the barrel a distance corresponding to that which the rack is advanced; a nose rotatably mounted upon the barrel and having an opening through which said lead projects exteriorly of the barrel; and a cage connected to the nose for rotation therewith and extending longitudinally of and within the barrel, said cage including rods extending between opposite ends of the cage and angularly spaced about the circumference of the cage, the rack including a collar having notches formed therein within which notches the rods are engaged, thus to permit sliding movement of the rack within the cage, while interengaging the rack and cage for conjoint rotation, said rack when rotated responsive to rotation of the nose and cage disengaging from both of said pawls, whereby to free the rack for return movement to its initial position responsive to shifting of an inserted lead in an axial direction inwardly of the barrel.

2,771,859
VIBRATOR DEVICE
Lyle E. Matthews, Oxnard, Calif., assignor to the United States of America as represented by the Secretary of the Navy
Application October 27, 1955, Serial No. 543,284
5 Claims. (Cl. 121—17)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. A vibrator device which comprises a hollow body means, means for dividing the interior of said body means into a plurality of chambers, a piston slidably disposed in one of said chambers, valve means for venting another of said chambers to atmosphere, means connected to said piston and said valve means to cause them to move synchronously, and means for introducing fluid pressure into said one and said other chambers, the fluid introduced into said other chamber being under greater pressure than the fluid introduced into said one chamber.

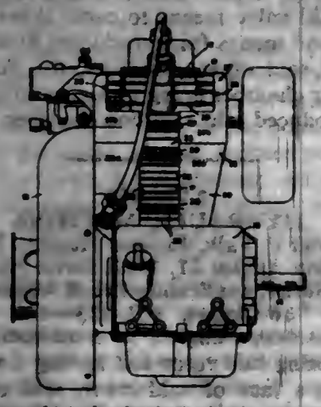
2,771,860
HYDRAULIC MACHINE
Werner P. Falk, Jackson Heights, N. Y.
Application August 21, 1951, Serial No. 242,985
Claims priority, application Brazil August 22, 1950
10 Claims. (Cl. 123—16)

1. In a diesel-type engine, in combination, a rotor, a housing enclosing said rotor and having a stationary side wall adjacent a face of said rotor, said rotor having a chamber open at said face but closed by said wall, fuel injector means in said wall positioned for periodic com-

munication with said chamber, a liquid in said housing partly received in said chamber and forming a piston therein, means including said liquid piston for compressing a charge in said chamber immediately prior to its

passage past said fuel injector means and for ejecting an exploded charge from said chamber, and means including said liquid for urging said rotor into close contact with said wall.

---



2,771,861
INTERNAL COMBUSTION ENGINES
Albon Hilpert, Hamburg-Blankenese, Germany
Application July 22, 1950, Serial No. 175,338
1 Claim. (Cl. 123—32)

An internal combustion engine having an auxiliary chamber and a main combustion chamber, a common high pressure fuel injection nozzle for the main combustion chamber and the auxiliary chamber, an opening between the main combustion chamber and the auxiliary chamber, a valve in the main combustion chamber for closing the opening between the main combustion chamber and the auxiliary chamber, and means actuating said valve for closing said opening when a predetermined compression pressure is reached, said valve being positively opened after self-ignition of the fuel-air mixture in the main combustion chamber.

---

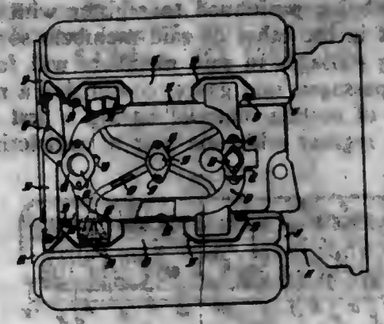
2,771,862
COOLING SYSTEM FOR AIR COOLED ENGINES
Peter Altman, Detroit, and Laurence D. Bakke, Plymouth, Mich., assignors to Continental Motors Corporation, Detroit, Mich., a corporation of Virginia
Application May 4, 1954, Serial No. 427,560
2 Claims. (Cl. 123—41.65)

1. In an air cooled single cylinder engine having a vertically disposed finned cylinder and cylinder head and a crankshaft, a cooling system therefor comprising a blower mounted directly on the engine crankshaft and disposed at one end of said engine, a blower casing having an outlet discharging cooling air toward said engine cylinder and cylinder head, the greater part of said cylinder head disposed higher than a horizontal plane containing the uppermost edge of said blower outlet, and a shroud encircling both said cylinder and cylinder head and having an outlet on one side of said engine only, said shroud providing a vertical chimney open to said blower outlet and extending from the base of said cylinder to the top of said cylinder head, said shroud defining an air passage for flowing the cooling air around more than half of the cylinder and cylinder head in heat exchange relation to the fins carried thereby, said shroud outlet comprising a vertical opening extending from near the base of the cylinder to the top of said cylinder head, said opening being of greater unrestricted width adjacent the cylinder head than adjacent the cyinder, whereby to create some degree of back pressure to the cooling air flowing around the cylinder in order to induce relatively more flow of air upwardly through said chimney and thence around the cylinder head.

---

2,771,863
V-TYPE INTERNAL COMBUSTION ENGINE AND INTAKE MANIFOLD THEREFOR
Ferdinand A. E. Porsche, Stuttgart, and Robert Binder, Winnenden, Germany, assignors to Dr. Ing. h. c. F. Porsche K.-G., Stuttgart-Zuffenhausen, Germany
Application May 26, 1954, Serial No. 432,552
6 Claims. (Cl. 123—52)

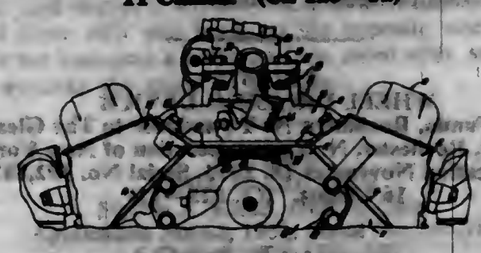
1. In an internal combustion engine having cylinders arranged in two rows at an angle with respect to each other, an intake manifold for supplying a mixture of fuel and air to the cylinders of both rows, said manifold comprising a pair of similar interchangeable metal members joined together by readily removable fastenings, said manifold comprising a preheater section located centrally of the engine above the cylinders equally divided between said pair of metal members, said central section including a main suction channel in each metal member and a common heating space for heating the fuel and air mixture in said main suction channels, each metal member including integral suction pipes connected into its main suction channel, the suction pipes of the metal members extending respectively to the cylinders of the respective rows of cylinders, means including a pipe for conducting hot exhaust gases from one row of cylinders to said heating space, and means including a pipe for conducting exhaust gases from said heating space to the exhaust outlet of the other row of cylinders.



---

2,771,864
INTAKE MANIFOLD
Darl F. Caris, Bloomfield Hills, and Fred Davis, Romeo, Mich., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application December 30, 1954, Serial No. 478,641
13 Claims. (Cl. 123—52)

1. An intake manifold comprising a member having a distribution chamber formed in the middle thereof, fuel supply passages communicating with said chamber substantially normal thereto, a plurality of branch passages

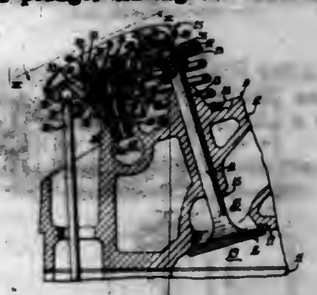


extending through said manifold, the inner ends of said branch passages communicating with said distribution

chamber and the outer ends thereof forming ports in the sides of said manifold.

---

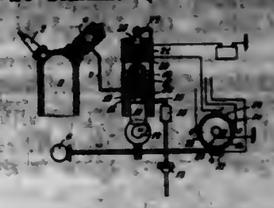
2,771,865
MANIFOLD SUPPORT STRUCTURE
Adelbert E. Kolbe, Detroit, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application October 1, 1954, Serial No. 459,608
11 Claims. (Cl. 123—52)



1. A manifold structure for an internal combustion engine having spaced and oppositely disposed pairs of heads and a block on which said heads are mounted and having sealing means formed on said heads and said block and facing outwardly of said engine and comprising a continuous body having passage means formed therein and adapted to open into the interior of said engine, said body having sealing means formed thereon in opposed relation to said sealing means on said heads and said block, said sealing means on said body and said heads and said block being formed to extend in opposed and engaging relation along the adjacent sides of said heads and in spaced relation to the inner edges thereof and across the ends of said block and continuously around the outer edges of said body and enclosing the outwardly opening interior surfaces formed on and within said heads and said block, and means for securing said body against said heads and said block and upon said sealing means of said heads and said block and limiting access to said interior surfaces of said heads and said block to said passage means in said body.

---

2,771,866
AUTOMATIC LASH ADJUSTER
Achilles Charles Sampietro, Ann Arbor, Mich., assignor to Thompson Products, Inc., Cleveland, Ohio, a corporation of Ohio
Application July 2, 1954, Serial No. 440,896
14 Claims. (Cl. 123—90)

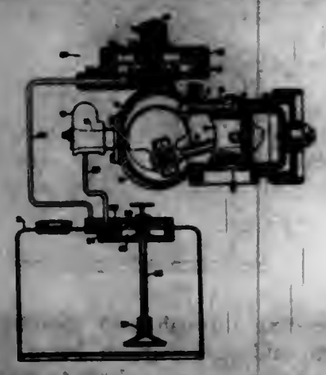


13. In combination, a rocker of generally upwardly presenting channel-like shape having its bottom wall spherically depressed intermediate the ends to socketably receive a ball-ended rocker journaling member, oppositely reciprocating elements terminating in end-abutting engagement with the under surface of said bottom wall adjacent the respective ends of the rocker, a fixed support below the rocker having an oil gallery supplied with oil under pressure, a lash adjuster including a member of generally upwardly presenting cup shape having side walls defining a cylinder bore and terminating with an externally ball-shaped end wall journaling said spherically depressed rocker bottom wall, a plunger having a close fit in said bore and cooperating with said end wall in defining an oil pressure chamber, said plunger having an oil passage extending internally thereof from said chamber, a check valve movable into blocking relation with said passage under pressure from within the chamber, said plunger having a reduced diameter stud

portion extending through said chamber and fixed to said support, said stud portion being provided with a passage connecting said oil gallery to said passage above the check valve, said end wall and rocker bottom wall being apertured for passage of said stud portion, and means sealing said end wall aperture to said stud portion whereby substantially all leakage from said chamber occurs between the surfaces of said plunger and cylinder bore from which it overflows into the space between the channel side walls of the rocker.

---

2,771,867
INTERNAL COMBUSTION ENGINES
Lucien Péras, Billancourt, France, assignor to Regie Nationale des Usines Renault, Billancourt, France
Application October 29, 1953, Serial No. 388,999
Claims priority, application France November 7, 1952
16 Claims. (Cl. 123—112)

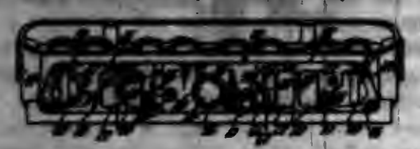


1. In a piston engine constructed for fuel injection and controlled ignition wherein air admission is constant and corresponds to the quantity of air required for maximum power, means defining an injection circuit for each engine cylinder for injection of fuel, said circuit communicating with the cylinder and with a fuel injection pump, means defining a discharge orifice in said circuit for discharge of fuel from the circuit, a shut-off element for said orifice, and means for controlling the shut-off element to permit selective opening and closing of said orifice whereby the fuel supply through said circuit to the cylinder may be completely interrupted, said last-named means being adapted to cut-off the fuel supply to the cylinder and thereby to reduce the power of the engine to a power fraction, the numerator of which is equal to the number of fuel injections during a predetermined number of cycles which is equal to the denominator of said fraction.

---

2,771,868
ENGINE FUEL PRESSURE REGULATOR
Carl Kauth, Fond du Lac, Wis., assignor to Kiekhaefer Corporation, Cedarburg, Wis.
Application September 9, 1954, Serial No. 454,966
4 Claims. (Cl. 123—136)

1. In a fuel system for a high-speed engine employing crankcase precompression of the fuel and air mixture and



having a remote fuel tank with a line for pressure effecting delivery of the fuel from the tank to the engine, a regulator valve for said pressure line comprising a rigid member and a flexible diaphragm secured to form a valve chamber connected with said line, said member having a passage from said chamber communicating with the engine crankcase, said diaphragm being yieldable to the pressure in said passage to periodically open the passage and allow gases from the crankcase into the valve cham-

ber, and to the tank, said diaphragm otherwise normally closing said passage to prevent the return flow of gases into said passage whereby the periodic pressure in the crankcase develops a constant pressure within the tank upon initial engine operation, and said diaphragm being further yieldable to said pressure in the chamber whereby a predetermined pressure within the tank and chamber prevents closing of the passage so that such pressure is thereupon maintained during continued engine operation.

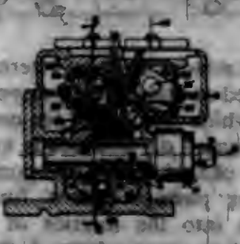
---

**2,771,869**
**GASKET**
**Clayton R. Leach, Pontiac, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware**
**Application September 29, 1954, Serial No. 459,136**
**9 Claims. (Cl. 123—193)**

1. A gasket adapted to be compressed between a pair of members having abutting surfaces thereon and passages extending therethrough to form ports in said surfaces, each of the ports in one surface being positioned to register with a corresponding port in the other surface so that the passages in one member will be individually joined with a corresponding passage in the other member so as to form separate sets of passages, said gasket including a first portion having an aperture therein positioned to register with the ports formed by one set of said passages, said portion consisting substantially entirely of one material which is particularly adapted for sealing the fluid in said set and a second portion having an aperture therein to register with the ports formed by another set of passages, said second portion consisting substantially entirely of a material which is particularly adapted for sealing the fluid in said other set of passages.

---

**2,771,870**
**GASKET**
**Robert R. Hutchison, Birmingham, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware**
**Application September 29, 1954, Serial No. 459,187**
**3 Claims. (Cl. 123—193)**



1. A gasket adapted to be compressed between a pair of mating surfaces on two separable members, each of said members including a pair of passages which form a pair of ports in the mating surface on that member, each of said ports being positioned to register with a corresponding port in the other of said members so that the corresponding passages in said members will form separate sets of passages, said gasket comprising a relatively thin member of sealing material having a first aperture positioned to register with one pair of registering ports

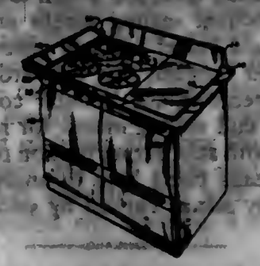
and another aperture positioned to register with the other pair of registering ports, the adjacent portions of said aperture being separated from each other by a connecting portion of said thin member, an opening positioned in said connecting portion in substantial alignment with said adjacent portions of said apertures, to form a continuous leakage barrier extending transversely between said adjacent portions for substantially the full width of said connecting portion.

---

**2,771,871**
**WHEEL DRESSING DEVICE**
**Arthur Fumia, Rochester, N. Y., assignor to The Gleason Works, Rochester, N. Y., a corporation of New York**
**Application November 18, 1953, Serial No. 392,382**
**16 Claims. (Cl. 125—11)**

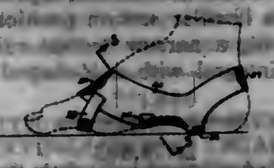
15. A wheel dressing device comprising a support, a pair of carriers mounted on the support for angular and axial motion about and along a common axis, a wheel-dressing element mounted on each carrier, means connecting said carriers for angular motion in unison with each other, and means for moving them axially independently of each other in time with their angular motion.

---



**2,771,872**
**DEVICE FOR SAWING PLASTIC MASSES**
**Charles Gunnar Birger Bergling, Orebro, Sweden, assignor to Durox International S. A., Luxembourg, Luxembourg, a company of Luxembourg**
**Application November 15, 1954, Serial No. 468,905**
**3 Claims. (Cl. 125—18)**

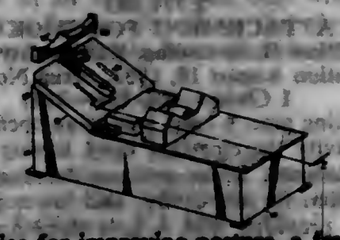
1. A device for sawing plastic masses, such as lightweight concrete, comprising at least one straight core-wire stretched between stretching means, and an outer wire having a smaller cross-sectional area being arranged in spiral form around said straight core-wire, the outer wire spiral being arranged in at least two sections arranged end-to-end along the core-wire with alternating pitch in adjoining sections, the outer wire between two adjoining sections being arranged to form a loop, which forms the turning point in the pitch directions of the two wire spirals.



**2,771,873**
**STOVE GUARD**
**Horace M. Baker, Jr., Lumberton, N. C.**
**Application June 17, 1952, Serial No. 293,910**
**5 Claims. (Cl. 126—214)**

5. A stove guard comprising a member for disposition upon the upper portion along the marginal edge of a stove, said guard having a rim, a wall inclined downwardly and inwardly from said rim and provided with a supporting portion adapted to rest upon the upper surface of the stove, locating means on the under side of said first mentioned member for locating the guard upon a stove, a hook on said guard spaced rearwardly from said member, spring means urging said hook toward said member whereby said guard may be placed on a stove with said hook on the opposite side of said stove for engaging a portion of the stove with said hook for securing the guard in position.

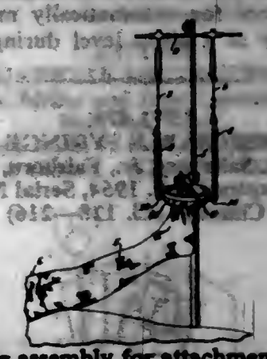
---



**2,771,874**
**FOOT STABILIZER**
**Melvin A. Kissel, Elinton, Okla.**
**Application June 3, 1953, Serial No. 359,261**
**6 Claims. (Cl. 128—75)**

1. A foot posturing and exercising appliance made of elastic strips interconnected to form: a horizontal extent for traversing an area over the metatarsal bones; a lateral extent for engagement with the posterior surface of the calcaneus bone of the foot; two spaced apart side strips connecting the two lateral extents, each side strip adapted to extend longitudinally along a different side of said foot; and a plurality of transverse bands connected to both of said side strips, at least one of the bands adapted to extend beneath said foot and at least one of the bands adapted for traversing the plantar surfaces of the foot immediately distal to the heads of the metatarsal bones thereof; said bands resiliently holding the lateral extents and the horizontal extent in proper position to be worn on the foot.

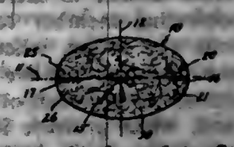
---



**2,771,875**
**POSTURE IMPROVING DEVICE**
**Forrest D. Cason, San Antonio, Tex.**
**Application October 31, 1951, Serial No. 254,023**
**16 Claims. (Cl. 128—44)**

1. In a device for improving posture, a frame, a thigh rest movably mounted for movement of translation on said frame, said thigh rest proportioned to engage the outer, inner and ham string muscles of the upper thigh, a motor mounted on said thigh rest and arranged to impart vibratory movement through said rest to said muscles whereby the muscles of the upper thigh may be completely relaxed, all subconscious tensions released and any downward and forward pull on the pelvis by said muscles released.

---

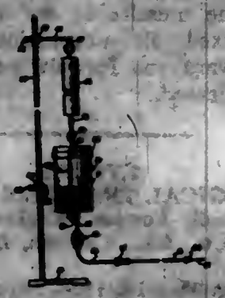


**2,771,876**
**SURGICAL TRACTION MEANS**
**William H. Scholl, London, England, assignor to The Scholl Mfg. Co., Inc., Chicago, Ill., a corporation of New York**
**Application May 18, 1954, Serial No. 430,576**
**10 Claims. (Cl. 128—84)**

1. A holding assembly for attachment to a bandage for traction purposes, including a locking member, a resilient gripping member, and an anchor member, all said members having complemental end faces and being disposable in juxtaposition axially of the assembly with the bandage interspersed between each pair of adjacent members.

---

**2,771,877**
**PAD**
**Albert M. Kligman, Philadelphia, Pa., and Marta Dehn, New Brunswick, N. J., assignors to Johnson & Johnson, a corporation of New Jersey**
**Application January 18, 1955, Serial No. 482,697**
**9 Claims. (Cl. 128—153)**



1. An absorbent pad adapted to fit between the toes, said pad being flat, having a generally rotund shape, and having an axis in the plane of the pad passing through the center of the pad, two slits passing entirely through the thickness of said pad disposed substantially on said axis, each slit extending from an opposite edge of said pad toward but terminating short of said center, thereby forming a tab on each side of each slit, said pad in position having said axis passing between the toes and one of its surfaces contacting and separating adjacent interdigital surfaces, while said tabs on opposite sides of the same slit conform to the surface of the foot and extend away from each other and from said interdigital surfaces.

---

**2,771,878**
**INTRAVENOUS INFUSION SYSTEM**
**Willard E. Folland, Williamsville, N. Y., and Charles A. Ellis, Southbridge, Mass., assignors to American Optical Company, Southbridge, Mass., a voluntary association of Massachusetts**
**Application August 27, 1952, Serial No. 306,636**
**16 Claims. (Cl. 128—214)**

2. In an intravenous infusion system embodying a container carrying a supply of fluid to be gravitally fed

from said container through conduit means into the blood stream of a patient, control means connected with said conduit means for controlling the rate of flow of said

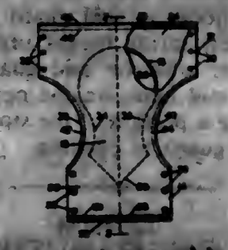
fluid through said conduit, and adjusting means connected with said container for automatically maintaining said fluid substantially at a given level during infusion.

---

**2,771,879**
**DISPOSABLE SYRINGE**
Alvin R. Salisbury, Jr., Fairborn, Ohio
Application September 9, 1954, Serial No. 454,925
8 Claims. (Cl. 128—216)

7. A disposable syringe comprising a body of resilient material having a closed liquid containing chamber of oval cross section and a passage extending between the chamber and the exterior of the body and adapted to receive a hollow needle through which the contents of the chamber is expelled when the chamber volume is reduced, said body including opposed wall portions movable toward each other to reduce the volume of said chamber and away from each other to make the chamber more circular in cross section to increase the chamber volume, and an aspirating member connected to each of said wall portions and acting, when pressure is applied thereto in one direction relative to the body, to move said wall portions toward each other to reduce the chamber volume and, when pressure is applied thereto in another direction relative to the body, to separate the wall portions to increase the chamber volume thereby creating a suction in the passage.

---



**2,771,880**
**SYRINGES**
Fred Gotthart, Ridgewood, N. Y.
Application January 13, 1953, Serial No. 331,029
8 Claims. (Cl. 128—218)

1. A syringe of the class described, comprising: a barrel having an open end and an outwardly flaring portion at said open end, the end opposite said open end being adapted for engagement with a hypodermic needle; a cup member surrounding said barrel and extending past and surrounding said flaring portion of said barrel; a loosely fitting piston disposed within said barrel and slidable therein; resilient sealing means engaging said flaring portion of said barrel and said piston resilient washer means positioned between said outwardly flaring portion and said cup member; and annular compression means bearing against said sealing means for retaining the same in engagement with said flaring portion of said barrel, said compression means being held in engagement with said sealing means by means carried by said cup member.

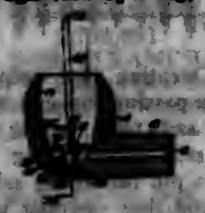
---

**2,771,881**
**PROTECTIVE DEVICE FOR INFANTS**
Irene E. Betts, Lincoln, Nebr., assignor of one-half to Elsie L. Boyd, Lincoln, Nebr.
Application April 1, 1955, Serial No. 498,565
5 Claims. (Cl. 128—287)

1. A protective garment comprising a rear portion and a front potrion connected to the rear portion with a portion adapted to extend through the crotch and having arcuate recesses therein, and a protective cushioning pad having a circular section positioned in the rear portion and having a narrow section extended through the crotch and integral with a V-shaped section in the front portion.

---

**2,771,882**
**HYGIENIC INSERTION FOR WOMEN**
Curt Walter Leopold, Nuremberg, Germany, assignor to Verein für Papierwerke Schleichsdorn & Co., Nuremberg, Germany, a German firm
Application September 23, 1952, Serial No. 311,014
Claims priority, application Germany September 29, 1951
1 Claim. (Cl. 128—290)



A flat absorbent body of U-shape in cross section consisting of non-compressed fibrous material and a covering wrapping said absorbent body and consisting of a porous fabric, said body being provided with marks indicating the places at which the said absorbent body is to be subdivided for forming individual hygienic insertions for women adapted to be inserted in the U-shape form.

---

**2,771,883**
**FILTER ATTACHMENT FOR SMOKING PIPES**
William R. Spaulding, Kansas City, Mo.
Application August 10, 1953, Serial No. 373,694
1 Claim. (Cl. 131—208)

In a smoking pipe, a bowl having an open-top, tobacco-receiving cavity therein, said bowl having an internally concavely arcuate, lower portion defining a concavely arcuate bottom for the cavity, said lower portion of the bowl being provided with a hole therethrough communicating with the bottom of the cavity; a support element having a pair of integral, axially aligned, cylindrical portions of different diameters, there being a shoulder on the one portion of larger diameter facing the other portion of smaller diameter, said element having an elongated, axial, threaded bore therethrough, an upper portion of said bore being adapted to receive a threaded installation rod; a replaceable, initially flat, foraminous, non-flammable, resilient, annular disc of greater outer diameter than the inner diameter of the bowl at the normal location at which the disc is to be used, said disc having a central opening therein of greater diameter than said other portion and of lesser diameter than said one portion, said disc being disposed upon said element in engagement with said shoulder and with said other portion extending through said opening; a cylindrical, tubu-

lar collar of outer diameter substantially equal to said one portion of the element, of a length substantially equal to said other portion of the element and of an inner diameter greater than the latter, said collar being slidably fitted upon said other portion of the element and having its upper extremity in engagement with the disc to hold the latter against the shoulder, the lower extremity of the collar being in engagement with said concavely arcuate lower portion of the bowl and closing the cavity off from the hole, the lower extremity of the element being within the collar and spaced above said lower portion of the bowl; and a screw extending through said hole in the bowl and threaded into said other portion of the element, said screw having a head of greater diameter than the hole and disposed externally of the bowl.

---

**2,771,884**
**ASH TRAY WITH A LARGE NUMBER OF CAVITIES FOR EXTINGUISHING CIGARETTES**
Ella P. [illegible], New York, N. Y.
Application July 29, 1952, Serial No. 301,515
5 Claims. (Cl. 131—235)

1. An ash tray comprising three endless elements having spaced endless facing walls and the outer one of which has a bottom, the middle endless element having projections on both sides thereof forming indents therebetween and the two walls that face the middle element having indents complementary to the indents between said projections, whereby each pair of complementary indents forms a cigarette extinguishing cavity having a cross-section large enough to receive a cigarette and small enough to limit the supply of air and thereby rapidly extinguish a cigarette, and a projection on one of the endless walls which is adapted to fit into one of said indents in an adjacent wall only when the last two-mentioned walls are aligned so that their complementary indents cooperate to form cigarette-extinguishing cavities.

---

**2,771,885**
William George [illegible], Alberta, Canada
Application [illegible], 1954, Serial No. 448,799
[illegible] Claims. (Cl. [illegible])

1. In an ash tray, a [illegible] open-top [illegible] receptacle within the casing, [illegible] the receptacle leading to the interior thereof, a conveyor within the casing encircling the receptacle and adapted to receive material deposited in the open end of the casing, means for selectively moving the conveyor around the receptacle to deposit material on the conveyor into the opening in the receptacle.

---

**2,771,886**
**CIGARETTE EXTINGUISHER**
Edward D. Miller and Jesse Laurence Driscoll, Bellevue, Wash.
Application April 9, 1954, Serial No. 422,071
3 Claims. (Cl. 131—256)

3. A smoker's extinguisher device adapted to hold a match book having a back cover, front flap, and abrasive flap in conventional arrangement, comprising: a single strip of rolled sheet metal having a bent portion at one end forming a tube, the tube being open at least at one end to form an extinguisher, the remainder of said strip forming a backing flange and joining the tube portion at right angles so that the tube lies at one end of a first face of said backing flange forming an abutment, said backing flange having its side edges return-bent providing a pair of opposed lips extending a short distance over the margins of said first face of said backing flange in spaced relation thereto forming a guideway between the lips of a size to accept the back cover of such match book which may be slidably inserted in said guideway with the butt end of the match book abutting said tube and with the front flap free to form a lateral support, said lips at their ends opposite said tube being beveled whereby such match book may be creased in the edges at the joinder of the back cover and abrasive flap as it is inserted in said guideway to hold the book in place.

---

**2,771,887**
**BOBBY PIN DISPENSER**
Nathan L. Solomon, Englewood, N. J.
Application October 19, 1954, Serial No. 463,204
6 Claims. (Cl. 132—1)

6. A bobby pin dispenser of the class described, comprising a hollow casing, means for detachably and yieldably supporting bobby pins in the casing for movement toward the upper end thereof, an elongated spring member forming a closure for the upper end of said casing and, against which, the uppermost bobby pin is adapted to bear, one end of the spring member being fixed to one top side of the casing, the other top side of the

casing having means for guiding a bobby pin discharged from the casing, an ejector element keyed to and movable longitudinally of and with said spring member, said element being normally positioned on the spring member in spaced relation to one end of the uppermost bobby pin bearing against said spring member in ejecting said uppermost bobby pin from the second named upper side of the casing over said guiding means, said guiding means including means for spreading said side members of a bobby pin in the operation of ejecting the same from said casing, said last named means comprising a rib, substantially V-shaped in cross-sectional form, the upper surface of said rib being bevelled to free the bobby pin from the casing, and said casing having apertured sides facilitating mounting of bobby pins in the casing.

---

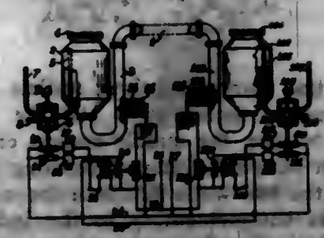
**2,771,888**
**HAIR NETS**
Arthur M. Herschkowitz, Scarsdale, N. Y.
Application November 13, 1953, Serial No. 391,908
9 Claims. (Cl. 132—49)

1. A hair net comprising a pouch of pliable net material made of intersecting strands extending from the rim of such pouch, an elastic filament arranged around the rim of said pouch, another elastic filament arranged in sinuous fashion on and around at least part of the rim region of said pouch; said elastic filaments substantially enclosing and forming borders around portions of said net material; said bordered portions constituting a comparatively small part of the entire pouch and the elastic filament which is around the rim, bordering each of said portions, means securing intersecting strands of the net material at substantially all their points of intersection and means securing said elastic filaments onto strands of said net material to remain positioned along the rim and in sinuous format respectively on said pouch; said elastic filaments being in stretched condition upon extension of the pouch.

---

**2,771,889**
**DENTAL CLEANER**
Margaret E. Fleming, Niagara Falls, N. Y., assignor to John S. Fleming, Niagara Falls, N. Y.
Application September 28, 1953, Serial No. 382,594
6 Claims. (Cl. 132—89)

1. A self-cushioned dental cleaner, consisting of a strip of flexible paper having a peripheral ribbon form tongue of the same breadth throughout its length, said tongue having a soft self-cushioned peripheral edge beveled upon one side thereof resulting from tearing said strip from and along a weakened tear line of a sheet of said paper, said tongue being movable between adjacent teeth with its soft edge pressed against the gums, said soft edge having a brushing action during said movement, said tongue being yieldable backwardly thereof under said pressure transmitted thereto through its soft edge, said soft edge being adapted to bear only a light pressure load.

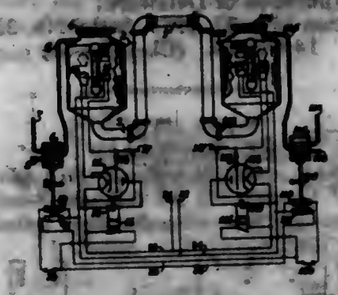


**2,771,890**
**COMB FOR TREATING THE SCALP**
Willy Isberg, Zurich, Switzerland
Application October 7, 1953, Serial No. 384,563
Claims priority, application Switzerland October 8, 1952
3 Claims. (Cl. 132—115)

1. A comb for treating the scalp, comprising teeth provided with bores passing through them longitudinally, a valve in each of said teeth, spring means for keeping said valve closed, said valve having a valve cone, said valve cone having a pin for lifting said valve cone from the valve seating and thus opening said valve and said pin projecting from the tip of said tooth and passing through its bore with clearance, each said bore having a wider part towards the back part of the comb, a packing ring on the shoulder terminating said wider part, a first sleeve inserted in said wider part and holding said packing ring in position on said shoulder, a second sleeve arranged in said first sleeve and having said valve cone on its end that is directed towards the tip of the tooth, said spring means being in the form of a compression spring and arranged in said first sleeve and said pin being tightly pressed into said second sleeve, a container for the substance intended for the treatment of the scalp, said container being arranged on the back part of the comb and consisting of a casing fitted tightly on the back part of the comb and provided with a filling opening and the interior of said container and said first sleeve being in communication, and a device connected to said filling opening for the purpose of applying pressure to the substance in said container.

---

**2,771,891**
**APPARATUS FOR CLEANING PIPE LINES**
Zoltan O. St. Pulley, Branford, Conn.
Application August 18, 1955, Serial No. 529,156
3 Claims. (Cl. 134—57)

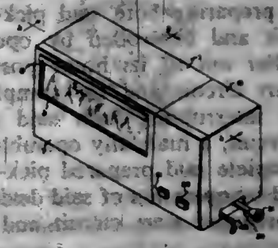


1. An apparatus for cleaning a pipe line comprising, a pair of closed tanks for holding the cleaning fluid, each with an outlet pipe connected to opposite ends of the pipe line; air supply pipes adapted to conduct compressed air, alternately, to one of said tanks, in order to force said cleaning fluid, through the pipe line, into the other tank; a pair of control valves, inserted into said supply pipes, each adapted to control the flow of the compressed air into one of said tanks, said valves having open and closed positions and being arranged to be in opposite positions during the cleaning operation of said apparatus; a pair of opening solenoids, operatively connected to said control valves, each being adapted to open one of said valves, when energized; a pair of closing solenoids, operatively connected to said control valves, each being adapted to close one of said valves, when energized; a pair of liquid detector housings, each being in communication

with a selected portion of one of said outlet pipes; a pair of floats, each movably mounted in one of said housings, and being adapted to assume a low position in the absence of cleaning fluid in the respective housing and to assume a raised position when buoyed by the fluid contained in said housing; a pair of switches, each operatively connected to one of said floats and having a closed position corresponding to one position of the respective float, and an open position corresponding to the other position of said float; electrical circuit means, interconnecting said switches and solenoids, and including time delay relays, being adapted to reverse the positions of said pair of control valves, after predetermined time delays, when one of said floats assumes the low position.

---

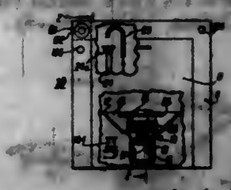
**2,771,892**
**APPARATUS FOR CLEANING PIPE LINES**
Zoltan O. St. Pulley, Branford, Conn.
Application August 3, 1955, Serial No. 526,247
4 Claims. (Cl. 134—57)



1. An apparatus for cleaning a pipe line, comprising, a pair of closed tanks for holding the cleaning fluid, with outlets connected to opposite ends of the pipe line; a pair of fluid level gauges, with light-transmitting walls, each mounted on one of said tanks, and being adapted to have the same fluid level as the corresponding tank; a pair of light sources, each vertically adjustably mounted on one of said tanks, and being adapted to project a beam of light to the fluid level gauge on the same tank; a pair of photo-cells, each vertically adjustably mounted on one of said tanks, and being disposed to receive illumination by portions of said beam of light projected to the fluid level gauge on the same tank, said illumination being variable in intensity depending whether said fluid level gauge contains air or fluid in the path of said beam of light; a pair of relay switches, each operatively connected to one of said photo-cells, and being adapted to be in the closed position when the illumination of said photo-cell corresponds to a fluid content of said level gauge, and to be in the open position when the illumination of said photo-cell corresponds to an air content of said level gauge, in the path of said light beam; air supply lines adapted to conduct compressed air, alternately, to one of said tanks in order to force the cleaning fluid through the pipe line, into the other tank; a pair of control valves, inserted into said air supply lines, each adapted to regulate the flow of compressed air into one of said tanks, said valves having open and closed positions and are arranged to be in opposite positions during the cleaning operation of said apparatus; remote control means, inter-connecting said control valves and said relay switches, and being adapted to reverse the positions of the said pair of control valves when one of said relay switches has moved into the closed position.

---

**2,771,893**
**DISHWASHER**
Joseph J. Houghton, Houston, Tex., assignor to General Electric Company, a corporation of New York
Application December 3, 1954, Serial No. 472,943
1 Claim. (Cl. 134—57)



An automatic dishwashing machine comprising a dishwashing compartment adapted to receive separate charges of water for each of a plurality of sequential washing operations, an overflow conduit communicating with an overflow opening in said compartment limiting the water holding capacity thereof to one of said charges of water, a drain conduit communicating with the lowermost portion of said compartment, a drain valve in said drain conduit, a water storage tank adjacent said compartment having its bottom wall located above said overflow opening in said compartment, an electric heater in said tank, float operated switch means for controlling the energization of said heater in accordance with the water level in said tank, a conduit having one end adapted to receive water from a water faucet and the other end connected to the top of said tank, a vertical overflow pipe mounted in said tank and extending below the bottom wall thereof, said pipe having an open upper end terminating below the top of said tank, a first valve aperture in said pipe located adjacent said bottom wall of said tank, a

second valve aperture in said pipe located between its open upper end and said first valve aperture, a pair of valve elements normally seated in said apertures but movable to open positions by an actuating rod arranged to sequentially engage said valve elements so as to open said second aperture before opening said first aperture, a conduit connecting the lower end of said pipe and said compartment whereby water entering said pipe from said tank flows into said compartment, a spray device in said compartment, a recirculating motor driven pump having its inlet connected to the lowermost portion of said compartment and its outlet connected to said spray device, and a timing device arranged to operate said drain valve, actuating rod, and pump in sequence whereby articles placed in said compartment may be initially rinsed by a charge of water stored in said compartment, and thereafter washed and rinsed by two separate charges of water sequentially admitted to said compartment from said tank through said first and second apertures in said overflow pipe.

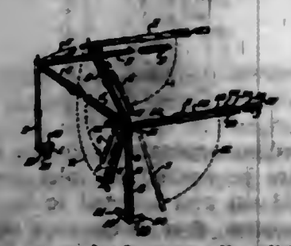
---

**2,771,894**
**CONTROL CIRCUITS FOR DISHWASHING APPARATUS**
Frank D. Low, La Grange Park, Ill., assignor to General Electric Company, a corporation of New York
Application November 29, 1955, Serial No. 549,599
16 Claims. (Cl. 134—57)

1. In dishwashing apparatus including a vat adapted to receive dishes to be washed, an inlet conduit communicating with said vat and adapted to be connected to a water supply system, first mechanism selectively operative to control the introduction of water into said vat via said inlet conduit, an outlet conduit communicating with said vat and adapted to be connected to drain plumbing, second mechanism selectively operative to control the removal of water from said vat via said outlet con-

duit, third mechanism selectively operative to wash dishes arranged in said vat, an electro-responsive program controller having a home position and a plurality of control positions and operative in a given timed cycle from its home position through its control positions and back into its home position, and means selectively governed by operation of said program controller through its control positions for selectively operating said first mechanism and said second mechanism and said third mechanism in a given sequence in order to produce a given washing cycle in said vat; the control circuit combination comprising a start circuit for operating said program controller, a run circuit for operating said program controller, an electro-responsive device operative to effect operation of said first mechanism so as to introduce water into said vat, a pick-up circuit for operating said device, a hold circuit for operating said device, means controlled by operation of said program controller into its home position for preparing said start circuit and for interrupting said run circuit and for preparing both said pick-up circuit and said hold circuit and controlled by operation of said program controller out of its home position for interrupting said start circuit and for completing said run circuit and for interrupting both said pick-up circuit and said hold circuit, a manually operable start member operative to complete said prepared pick-up circuit, and means controlled by operation of said device for completing both said prepared start circuit and said prepared hold circuit.

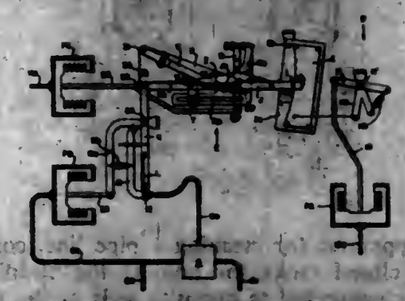
---



2,771,895
DISHWASHING MACHINE
William Bond, San Francisco, Calif.
Application August 1, 1955, Serial No. 525,564
5 Claims. (Cl. 134—172)

1. A dishwashing machine including a readily portable base pan, a collapsible top mounted on the top edge of said pan having a series of ribs pivotally mounted to swing about a horizontal axis located midway the sides of said pan, a flexible waterproof cover mounted over the outside of said ribs having one end thereof secured to the top edge of said pan between one end of said pan and said pivotal axis, and a water spray element mounted on the inside of one of said ribs.

---



2,771,896
COLLAPSIBLE TENT FRAMEWORK
John G. Call, Pikeville, Ky., assignor to The Tolstent Company, Inc., Pikeville, Ky., a corporation of Kentucky
Application April 19, 1951, Serial No. 221,755
4 Claims. (Cl. 135—4)

1. A corner post unit for a collapsible tent framework comprising a base plate having an adjacent pair of angular related side edges, a corner post secured at one end to said base plate at the apex of said angularly related edges, a fitting on the opposite end of said corner post, said fitting having a pair of arms paralleling the said adjacent side edges of said base plate and an additional, angularly related arm intermediate said first mentioned pair of arms, frame members pivoted to said arms and adapted to fold about said arms, the frame members pivoted to said first mentioned pair of arms being of a length to contact said base plate, and means for detachably connecting the ends of said last mentioned arms to said base plate to form with said corner post a rigid frame structure which constitutes a part at least of a carrying case for said tent frame, the frame member pivoted to said additional arm being adapted to be folded to lie within the confines of said rigid frame structure.

---

2,771,897
CONTROLLER HAVING AN OUTPUT PROPORTIONAL TO THE PRODUCT OF TWO INPUTS
William R. Bailey, Philadelphia, Pa., assignor to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., a corporation of Delaware
Application May 27, 1953, Serial No. 357,871
14 Claims. (Cl. 137—85)

1. A relay, including, a member pivoted to turn about a normally stationary first axis and having an arc-shaped surface intersecting said axis, parallel to a second axis displaced from the first mentioned axis, a strut pivoted to turn about said second axis extending between said second axis and said arc-shaped surface, said relay being operable, when said strut is angularly displaced from said first axis to move said second axis away from the initial position of said arc-shaped surface a distance proportional to the product of the angular displacement of said strut from said first axis and the angular adjustment of said member about said first axis from its initial position.

---

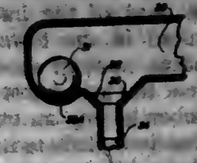
2,771,898
VALVE
Lutwin C. Retter, Maplewood, Mo., assignor to The McNeil Machine & Engineering Company, Akron, Ohio, a corporation of Ohio
Application June 22, 1953, Serial No. 362,980
6 Claims. (Cl. 137—107)

1. A valve comprising a cylinder having an inlet for pressure fluid and a lateral outlet forward of the inlet, a piston reciprocable in the cylinder and adapted to be moved by fluid pressure upon a pressure drop in the outlet from a retracted position rearward of the outlet to an advanced position wherein the outlet is open to the space in the cylinder rearward of the piston, a plunger assembled with the piston and movable by the piston and extending forward from the piston with its forward end slidable in sealed relation in an opening at the forward end of the cylinder, the plunger having a passage therethrough from rearward of the piston to the forward end of the plunger, the plunger-piston assembly being

formed to provide for communication between the space in the cylinder rearward of the piston and said passage and for restricted communication between the spaces in the cylinder rearward and forward of the piston, means at the forward end of the cylinder providing a chamber including an end wall having a vent port in alignment with the plunger with a valve seat at the inner end of the vent port, and also providing a transfer port through which fluid may flow to or from said chamber, the plunger having a rearwardly facing valve seat in the passage, a check valve in the plunger engageable with the seat in the passage for blocking flow through the passage, a spring biasing the check valve toward the forward end of the plunger for engagement with the seat in the passage, the check valve having a stem extending out of the forward end of the plunger in alignment with the vent port for engagement with the seat at the inner end of the vent port when the piston is in advanced position thereby to unseat the check valve and to close the vent port, the spring acting to drive the plunger rearward and move the piston to its rearward position upon cut-off of flow from the outlet thereby to seat the check valve and open the vent port.

---

2,771,899
VALVE MEANS
Sven Arild Swallert, Lidingo, Sweden
Application September 16, 1953, Serial No. 380,481
Claims priority, application Sweden September 18, 1952
1 Claim. (Cl. 137—224)



Valve means for a plurality of flexible elastic tubes enclosed within a tubular flexible non-elastic casing, comprising a housing to which said tubular casing is attached, said housing having a plurality of apertures extending into said tubular casing, one for each tube therein, a plurality of check valves each having one end in gas tight relationship with one of said tubes and extending through said apertures, the ends of said valves outside of said housing being larger than the apertures, and the ends inside of said housing being threaded, resilient sealing means between the larger ends of the check valves and the outside of said housing, a plurality of nuts one threaded onto each check valve within the housing to draw the valves into gas tight relationship with said housing, a cap having an aperture therein on said housing, a spring loaded check valve in said aperture, and means on said cap to permit introduction of air under pressure through said spring loaded check valve into the housing and then into the plurality of tubes through said plurality of check valves in said housing.

---

2,771,900
LIQUID SEALS
Benjamin B. Dayton, Rochester, N. Y., assignor, by mesne assignments, to Consolidated Electrodynamics Corporation, Pasadena, Calif., a corporation of California
Application June 28, 1950, Serial No. 170,170
3 Claims. (Cl. 137—251)

1. In a device having a conduit with a liquid seal therein, the combination which comprises a valve in the conduit having two parts with matching surfaces and means for moving the surfaces close to each other to close the valve and remote from each other to open the valve, at least one of the matching surfaces being so smooth that gallium will adhere to it, the smooth surface being surrounded by an adjacent roughened surface to which gallium will not adhere, and a film of liquid gallium on the smooth surface.

---

2,771,901
NON-RETURN VALVES
Eric Hardy Spock, Yeovil, England, assignor to Normalair Limited, Yeovil, England
Application April 13, 1953, Serial No. 348,303
5 Claims. (Cl. 137—269.5)

1. A reversible flap valve comprising a casing, two opposed valve seatings in said casing, a valve member between said seatings, a rocking supporting member encircling said valve member means for retaining said supporting member in a central position or into a position at either side of said position, said supporting member being so pivoted on said casing as to restrict said valve member to movements in a plane at right angles to the planes containing said seatings and means operable from the exterior of said casing for rocking said supporting member into any of said positions, a protuberance on both sides of said valve member adapted to coact with cam members adjacent to both seatings whereby before the valve member is transferred from one side to the other the valve member is raised off its seating and the valve member is prevented from striking and damaging itself or the seatings when the valve member is positioned in central position.

---

2,771,902
INSERT PUMP CAGE HAVING RECIPROCABLE VALVE
Charles P. Winchester, Kansas City, Mo.; Dollie Winchester, administratrix of said Charles P. Winchester, deceased
Application December 12, 1951, Serial No. 261,330
1 Claim. (Cl. 137—332)

In an insert type liquid pump, a standing valve assembly including an upper, elongated, tubular section internally threaded at its lowermost end; a lower, elongated, tubular section externally threaded at its uppermost end; an intermediate, elongated, tubular section externally threaded at its uppermost end and internally

threaded at its lowermost end, the uppermost end of the intermediate section being threadably secured in the upper section, the lowermost end of the intermediate section being threadably secured in the lower section; an internal, inwardly extending, annular shoulder on the intermediate section adjacent the lowermost end of the latter; a band-like, ring member having an external, outwardly extending flange portion intermediate its extremities, said member being provided with a valve seat on the upper extremity thereof and disposed within the lower and intermediate sections with said flange portion held between said shoulder and the uppermost end of the lower section; a vertically reciprocable, freely rotatable, generally cylindrical valve in the intermediate section and provided with a conical lowermost face normally resting on the seat in engagement therewith and extending into the ring member; a single, diametrical guide bar mounted in the intermediate section adjacent the uppermost end thereof, said bar having a bore extending therethrough centrally and axially of the intermediate section; an upstanding, elongated stem integral with the valve on the upper face of the latter, said stem being received for free reciprocatory and rotative movement within said bore of the bar; and an upwardly-facing, annular shoulder on the stem between the ends of the latter for engagement with the bar to limit upward reciprocation of the stem and valve.

---

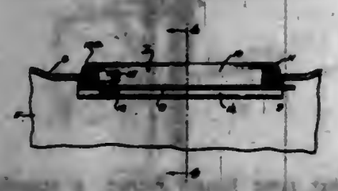
2,771,903

## DEVICE FOR THE PROCESSING OF FUSIBLE MATERIALS

Luigi Notarbartolo, Milan, and Werner Münch, Cesano Maderno, Italy, assignors to Perlegit Società per Azioni, Milan, Italy, an Italian company

Application October 20, 1952, Serial No. 315,768
Claims priority, application Italy October 31, 1951
1 Claim. (Cl. 137—341)

In an apparatus for spinning a synthetic linear polymer from the melt, in combination, a conduit for delivering molten polymer in a normally continuous flow from one point to another of said apparatus, a portion of said conduit being provided with projections in the inner wall of said conduit, means for normally maintaining said polymer therein in the molten state, and means for temporarily cooling said portion of said conduit, while the same is entirely filled with the aforementioned polymer, whereby to cause the temporary formation therein of a plug of solidified polymer and to discontinue said normally continuous flow of said molten polymer.



---

2,771,904

## FLOW CONTROL VALVE

Roger M. Sherman, Palo Alto, and James R. Mosher, San Jose, Calif., assignors to W. R. Ames Company, San Francisco, Calif., a corporation of California

Application December 8, 1952, Serial No. 324,735
8 Claims. (Cl. 137—454.2)

1. In a flow control valve adapted for insertion in a perforation in the wall of a pipe or like surface, the combination of a resilient molded body member having a rim defining a flow opening; a radially extending open groove bordering said rim, conforming at its base to the general shape of the perforation in said wall; an open straight groove on the inner surface of one edge of said rim facing, parallel and in the same plane as a second like groove thereon on the opposite edge, the two said grooves forming a support; and a rigid gate member slidable in said last mentioned grooved support to control the flow through said wall.

---

2,771,905

## VALVE CLOSING SPEED CONTROL MEANS

David E. Griswold, San Marino, Calif., assignor to Donald G. Griswold, Alhambra, Calif.

Application April 20, 1953, Serial No. 349,790
7 Claims. (Cl. 137—488)

3. In combination: a pressure fluid operable main valve for controlling flow of fluid in a pipeline to maintain a desired substantially constant pressure in said pipeline; control means connected with said main valve operable to supply operating fluid thereto for effecting slow closing of said main valve in response to a slight increase in pressure in said pipeline above said desired pressure: and control means connected with said main valve operable to supply operating fluid thereto simultaneously with said first-mentioned control means for effecting relatively quick closing of said main valve upon a relatively great increase in pressure in said pipeline above said desired pressure.

---

2,771,906

## FLUID FILLING SYSTEM

Warren A. Bratlech, Downey, and Philip H. Jones, Los Angeles, Calif., assignors to North American Aviation, Inc.

Application March 18, 1952, Serial No. 277,322
8 Claims. (Cl. 137—575)

1. In aircraft, a plurality of storage tanks, one of said tanks disposed above the elevation of the remaining tanks, conduit means interconnecting the bottom of said upper tank with said remaining tanks for permitting fluid flow from said upper tank to said remaining tanks, spring biased valve means for closing the said conduit means interconnection from said upper tank to said remaining tanks, a filler opening associated with the upper portion of said upper tank, a door member hingedly supported upon said upper tank within said filler opening, resilient means connected to said door member urging said door member into its closed position with respect to said filler opening, a pair of tension elements operatively connecting said door member with said spring-biased valve means in such manner that insertion of a filling nozzle within said filler opening and hinging of said member imparts opening of said door member and said spring-biased valve means and provides fluid interconnection of said upper and lower tanks for the filling thereof through said filler opening.

2,771,907

## PILOT CONTROLLED PISTON TYPE REVERSING VALVE

Joseph F. Joy, Pittsburgh, Pa., assignor to Joy Manufacturing Company, Pittsburgh, Pa., a corporation of Pennsylvania

Original application January 29, 1949, Serial No. 73,625. Divided and this application September 27, 1951, Serial No. 248,973
2 Claims. (Cl. 137—622)

1. In a reversing valve, a shell having an internal bore and a plurality of fluid passages through the shell, means for conducting a fluid under pressure to said shell, a hollow main valve member reciprocable in the shell and having at least one actuating piston and a means to prevent communication between certain passages and permit communication between certain passages according to its position, and a pilot valve member reciprocable in the main valve member and having at least one actuating piston, and a means for preventing and for permitting communication between said fluid under pressure and said one main valve actuating piston and said one pilot valve actuating piston means for moving said pilot valve relative to said main valve to provide communication between said fluid pressure conducting means and said one main valve actuating piston and said one pilot valve actuating piston to move said valves in one direction relative to said shell, means on said pilot valve for engaging said main valve to initiate movement of the latter if said fluid under pressure fails to do so and for striking said main valve at any point substantially throughout its distance of travel, if its movement is retarded, to urge it in said one direction of travel, and means to cushion the stopping of the main valve member by throttling including an end piston on said pilot valve spaced from said one pilot valve actuating piston and smaller than the hollow of said main valve member.

---

2,771,908

## EXTENSION FOR EXHAUST PIPES

Harry A. Wiese, South Spencer, Mass., assignor to The A & W Machine Company, Charlton City, Mass., a corporation of Massachusetts

Application March 19, 1954, Serial No. 417,298
3 Claims. (Cl. 138—46.5)

1. A device of the character described comprising a tubular extension member formed preferably of metal having a single opening in a side wall thereof, an attachment member in the form of a blade spring having an intermediate portion spaced inwardly from the inner wall of the tubular member, integral portions extending outwardly of the opposed ends of said intermediate portion and angled to the side of said intermediate portion toward the inner wall of said extension member and continuing into integrally formed inwardly curved portions shaped to engage with said inner wall of the extension member at spaced points adjacent the ends of said intermediate portion and thence [illegible] portions [illegible] formed to the plane of said intermediate portion and portions [illegible] leading inwardly beyond the plane of said intermediate portion on the side thereof opposed to said curved integral portions and being adapted to be fitted in engaged relation with the adjacent side wall of an exhaust pipe of a motor vehicle when said tubular extension member is placed thereon, said intermediate portion having an opening therein in susbtantial alignment with the opening in the side wall of the tubular extension member and a headed bolt extending outwardly through said aligned openings with its head engaging said intermediate portion and with its threaded end extending outwardly of the opening in the side wall of the tubular extension member and having a nut thereon which, when tightened, will draw said intermediate portion toward the inner adjacent wall of said extension member, simultaneously causing the curved integral portions to engage the inner wall of said tubular extension member with an effective rolling contact therewith which, in turn, causes said pointed ends, in response to said rolling contact, to resiliently bite into and secure the tubular extension member to the exhaust pipe.

---

2,771,909

## LOOM REED AND ACTUATING MEANS THEREFOR

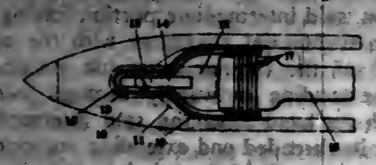
Gustave E. Ulrich, Union City, N. J., assignor, by mesne assignments, to Tapes, Inc., Paterson, N. J., a corporation of Delaware

Original application March 7, 1952, Serial No. 275,329. Divided and this application December 8, 1952, Serial No. 324,613
3 Claims. (Cl. 139—192)

1. A loom reed assembly comprising in combination with a reed carrier a pair of coacting clamp plates, each of said plates having flat parallel extending contacting portions, means extending through said portions and forming a fastening means for said plates on said reed carrier, one of said plates projecting coplanar with the aforesaid flat contacting portion thereof and the other of said plates having a right angular bend therein forming an abutment wall disposed in abutment with one side of said reed carrier, said last mentioned plate having an integral portion extending from said abutment wall in spaced offset parallel relation to the coplanar projection of the aforementioned plate, linearly extending transverse tongues carried on the aligned interior surface of the integral portion of said second plate and the coplanar projection of said first plate, a reed assembly comprising a multiplicity of reed blades and spacers disposed in alternate parallel relationship and fastening means for securing said reed blades and spacers together as a replaceable unit, said reed blades and spacers having aligned transverse grooves therein adapted to establish interfitting clamping relationship with said linearly extending transverse tongues when the flat parallel extending contacting portions of said plates are mounted in contacting position with the edges of said reed blades and spacers and with the ends thereof in abutting relation with the abutment wall of said second mentioned plate.

---

2,771,910



## SHUTTLE SPRING

Willard W. Tait, Hopedale, Mass., assignor to Draper Corporation, Hopedale, Mass., a corporation of Maine

Application January 28, 1954, Serial No. 406,689
4 Claims. (Cl. 139—197)

1. In a loom shuttle, filling bobbin holding means which comprises spring gripping jaws adapted to be

retained in one end of a shuttle, said jaws comprising an inner jaw member having a rigid clamping portion and extending therefrom opposed, flexing jaw members having curved portions terminating in relatively straight end portions with means adjacent said end portions for hold-

ing a bobbin, an outer member comprising a leaf spring of substantially the same general contour as the inner spring, of substantially the same extent and having pressure and frictional engagement with the relatively straight end portions only of said spring jaws.

---

**2,771,911**
**STOP MOTION FOR LOOMS**
Charlie W. Holt, Draper, N. C.
Application March 8, 1955, Serial No. 492,871
1 Claim. (Cl. 139—339)

In a loom having a breast beam over which cloth passes, an electric stop motion, a stationary member on said loom spaced forwardly of said breast beam, a sand roll spaced below said beam, first and second vertically spaced guide rolls spaced forwardly from the sand roll for guiding cloth to and away from the sand roll, respectively, and a take-up roll spaced beneath the second guide roll for taking up said cloth, the combination of an elongated relatively thin bracket secured for vertical adjustment to the stationary member and depending therefrom, a normally open toggle switch carried by said bracket below the stationary member and having an actuating arm projecting rearwardly therefrom and overlying the cloth between the sand roll and the second guide roll, and said switch being interposed in an electrical circuit to said stop motion whereby winding of the cloth around the sand roll beyond a predetermined amount causes the cloth to engage and move the actuating rm upwardly to close the switch and actuate said stop motion.

**2,771,912**
**DEVICE FOR LONGITUDINALLY RESHAPING CORRUGATED WIRE SPRINGS**
Svend G. Blumensaadt, Beachwood Village, Ohio, assignor to The Universal Wire Spring Company, Bedford, Ohio, a corporation of Ohio
Application September 15, 1951, Serial No. 247,109
1 Claim. (Cl. 140—99)

In a device for changing the longitudinal spacing of successively connected left and right handed loops of sinuously corrugated wires, a frame, a lazy tongs lever arrangement including a plurality of elongated pins pivotally coupling the cross bars of each pair of bars to each other and pivotally coupling at one side edge of said arrangement the cross bars of adjoining pairs of bars to each other, one of said pins, the pin which couples two of the symmetrically opposed bars of the two adjacent pairs of the cross bars in the center portion of the lazy tongs lever arrangement, being non-shiftably supported in said frame, a pin coupling the other two of the symmetrically opposed bars of said two adjacent pairs of cross bars in the center portion of the lever arrangement, said last pin slidably engaged with said frame to effect by actuation of the lazy tongs lever arrangement straight movements of the pins at said one side edge and arcuate movements of the pins pivotally connecting the cross bars of each of said pairs of cross bars with each other, wire engaging head portions on said pins adapted to engage loops and loop connecting wire portions of sinuously corrugated wires placed on the device, and power operated push block means engaged with the free ends of the lazy tongs lever arrangement for actuating same.

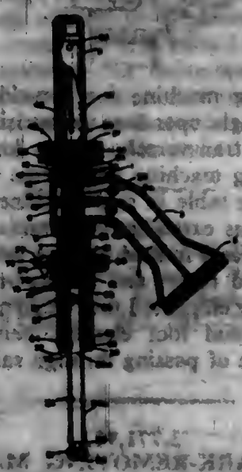
**2,771,913**
**BEVERAGE MIXER**
Ewald Flaudicher, Sprendlingen (Main), Germany, assignor to Erwin Lucas Bois, Incorporated, Englewood, N. J., a corporation of Delaware
Application February 23, 1955, Serial No. 490,864
3 Claims. (Cl. 141—9)

3. The method of producing a drink composed of a plurality of differently-colored liquors, consisting in locating a tube in the center of a drinking glass with the lower end of the tube at the bottom thereof, successively pouring the different liquors through said tube to successively reach the bottom of the glass and thereby cause each liquor to be elevated in the glass by those liquors which follow it and without causing material intermixture of the several liquors.

---

**2,771,914**
**DISPENSING APPARATUS FOR GRANULAR MATERIAL**
Paul O. Pinney, Long Beach, Calif., assignor to J. H. Keasey & Co., Inc., Chicago, Ill., a corporation of Illinois
Application July 12, 1954, Serial No. 442,739
12 Claims. (Cl. 141—82)

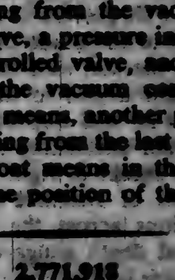


4. A dispensing apparatus for granular material comprising a housing including a front wall, said front wall having an opening therein and a platform, a cup dispenser within the housing, a chute extending from the cup dispenser to adjacent said platform, an electrically actuated cup release mechanism on the cup dispenser, a vertical shaft journaled in the housing, a pair of spaced discs mounted on the shaft, manual means to rotate said shaft, a plurality of containers removably mounted between the discs, a dasher in each of the containers, each

dasher including a vertical shaft journaled in the container, disengagable drive means on each of the last named vertical shafts, an electric motor within the housing and positioned over the container immediately adjacent said front wall, and drive means on the motor engageable with the first named drive means, a mounting for said electric motor whereby the electric motor is moved vertically relative to the container positioned below the electric motor, and electrical means connected to the motor mount whereby the electric motor is moved vertically, an electrical sequence actuating means including a switch electrically connected to the cup release, and a second switch electrically connected to said motor, and means to operate said actuating means in sequence.

---

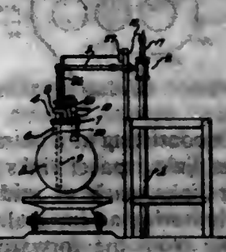
**2,771,915**
**FLUID DELIVERY DEVICE**
George Donald Hastings, Jr., Pasadena, and Clinton E. Hawk, Pomona, Calif., assignors, by mesne assignments, to Aerojet-General Corporation, Cincinnati, Ohio, a corporation of Ohio
Application February 18, 1953, Serial No. 144,932
9 Claims. (Cl. 141—116)



1. A fluid delivery device for supplying fluid to a container, said device comprising a first sleeve, and a second sleeve located within the first sleeve and providing a first annular space between said sleeves, a delivery plunger within the second sleeve with a second annular space between the plunger and the second sleeve, said plunger being slidable within the second sleeve and having a fluid conducting conduit at its lower end, communicating means between the second annular space and said conduit, an outlet from approximately the lower end of said conduit for delivery into the container, an inlet passageway communicating with said second annular space, an outlet passageway communicating with the first annular space, and means for protruding said plunger from said second sleeve so that said outlet is exposed to deliver fluid into the container.

---

**2,771,916**
**CAN FILLING MACHINE WITH REMOVABLE MANIFOLD MECHANISM**
William Pecky, Belmar, N. J., assignor to American Can Company, New York, N. Y., a corporation of New Jersey
Application December 21, 1953, Serial No. 399,593
6 Claims. (Cl. 141—180)



1. In a machine for filling sifted products and the like into containers, the combination of a vertically disposed rotatable carrier element having a receiving end and

side the path of travel of said end of the carrier element for introducing said product under pressure through said opening into the carrier element, said manifold having a loose and free mounting to facilitate quick removal for cleaning, a substantially point support for said manifold, and pressure means operable against said support to hold the manifold tightly against said end of the carrier element for the transfer of said product from said manifold to said carrier element without loss of said product.

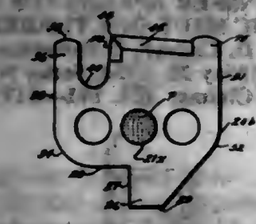
---

**2,771,917**
**LIQUID TRANSFER APPARATUS AND AUTOMATIC SHUT-OFF THEREFOR**
Murray D. Cannell, Wilmington, Calif.
Application May 28, 1954, Serial No. 431,231
4 Claims. (Cl. 141—217)

1. An automatic shut-off for a liquid transfer apparatus for tanks comprising a liquid intake pipe, a shut-off head mounted in the intake pipe, a valve in the shut-off head, a seat in said intake pipe against which the valve rests to close the intake pipe, pressure actuated means engaging said valve to move the valve to a closed position, an outlet pipe extending from the shut-off head and thence into said tank, a venturi in the outlet pipe, said venturi having a vacuum space therein, a vacuum controlled valve, a pipe extending from the vacuum space to the vacuum controlled valve, a pressure intake line extending into the vacuum controlled valve, and a pressure outlet line extending from the vacuum controlled valve into said pressure actuated means, another pipe extending into the tank, a line extending from the last named pipe to said vacuum space, and float means in the last named pipe closing said line in one position of the float.

---

**2,771,918**
**SAW BLADE WITH SWAGED TEETH**
Herman H. Watson, Dallas, Ga., assignor to Paulding Products Corporation, a corporation of Georgia
Application November 16, 1954, Serial No. 469,135
2 Claims. (Cl. 143—133)

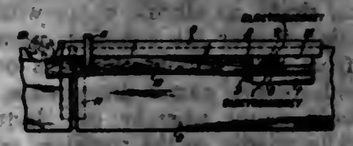


1. A saw comprising a metallic web and a row of teeth along its edge, said teeth presenting front and op-

posite side walls, the front faces being of diamond shape with their apices in substantial vertical alignment with the vertical axis of the web, the width of the teeth being such as to cause the side-edges of the teeth to project laterally, materially beyond the web, the diamond shape of the front faces of the teeth causing the teeth to present a part of greatest width that is substantially within the height of the diamond shaped front face, those portions of the teeth below said point of greatest width being substantially uniform in cross sectional shape throughout the length of the teeth and those portions of the teeth which lie above said point of greatest width being shaped to provide an inclined triangular surface which extends from the apex of the front wall to the opposite rear corners of those portions of the teeth which lie above the web, the said side edges of the teeth lying in parallelism with each other and in parallelism with the outer faces of the webs.

---

2,771,919
CHAIN SAWS
Joseph B. Cox, Portland, Oreg.
Original application July 1, 1946, Serial No. 680,549. Divided and this application October 8, 1951, Serial No. 250,282
3 Claims. (Cl. 143—135)



1. In a saw chain consisting of a plurality of alternating right and left cutter links, spacer links pivotally connecting adjacent cutter links, each of said cutter links consisting of a flat body having an integral depth gauge tooth extending outwardly from the forward end thereof and coplanar with said body and an integral cutter tooth spaced from said depth gauge tooth by a relatively deep sawdust recess, said cutter tooth consisting of a side wall portion and an outer flange portion, said portions being integral with said body and extending from said recess to the opposite end of said cutter link, said side wall portion being laterally offset throughout its length with respect to the plane of said body by a progressively decreasing amount from the forward edge to the rear edge thereof whereby said side wall portion is inclined throughout its height with respect to the plane of said body in the longitudinal direction thereof, said flange portion extending substantially at right angles to the plane of said body, the foremost edges of said side wall and flange portions being sharpened, said alternating cutter links being identical to each other except of right and left configuration, said flange portions of alternate cutter teeth extending in opposite directions across the median plane of said body, and a second depth gauge defining portion at the rear end of said cutter links.

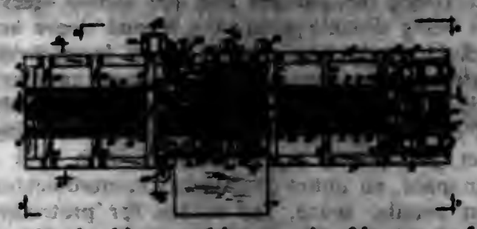
---

2,771,920
FEEDING DEVICE FOR THE WORKPIECE ON PLANING MACHINES
Friedrich Wilhelm Hermann Ambelang, Flensburg, Germany
Application April 25, 1955, Serial No. 503,618
5 Claims. (Cl. 144—114)

4. In combination with a table for planing machines comprised of two angularly disposed guiding surfaces extending in the same direction, a feeding device, said feeding device including two angularly disposed guiding surfaces in alignment with and cooperation with the respective guiding surfaces on said table, and electromagnetic means on said feeding device for insuring con-

tinuous contact between said table surfaces and said feeding device during the feeding of a workpiece along said table surfaces.

---



2,771,921
PLANING MACHINE FOR TWO-SIDED PLANING IN A SINGLE OPERATION
Friedrich Wilhelm Hermann Ambelang, Flensburg, Germany
Application April 25, 1955, Serial No. 503,617
1 Claim. (Cl. 144—117)

A wood planing machine for two-sided planing of a workpiece in a single operation comprising a jointing device displaceably transversely to the longitudinal direction of the planing machine and across the width of the machine, a planing table in said machine, elongated horizontal cutter means extending substantially the width of the said table, a recess in said planing table, a cover plate shiftable along said recess and having an opening, and a vertically operating elongated tool element provided above the cover plate, said tool element being adjustable in height and capable of passing through said opening.

---

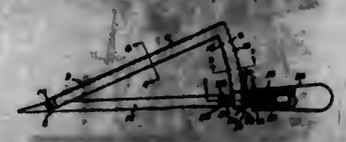
2,771,922
PULP-WOOD BARK-REMOVING MACHINE HAVING PIVOTABLE ANGULAR SUPPORTING ARMS FOR ROTATABLE CUTTERS AND BRUSHES
John L. Gyllenberg, Baker, Oreg., assignor to Anthony Breidenthaler, Baker, Oreg.
Application September 17, 1954, Serial No. 456,522
14 Claims. (Cl. 144—208)

6. In a log-barking machine, a pair of juxtaposed, parallel, horizontal log-feeding rolls adapted to support therebetween a log of substantially smaller diameter than said rolls, a log-barking tool for removing bark from said log, means for supporting said tool for movement to and from a lowered position against the top surface of a supported log including an arm mounted at one end for swinging movement about an axis located below the top surfaces of said rolls and sufficiently close to one roll so that a straight line through said axis and said lowered position of said tool extends through said one roll, said tool being rotatably supported on the other end of said arm, said arm being of generally bell-crank shape and having the lesser angle side thereof confronting said one roll and curved generally upwardly and inwardly around said one roll to accommodate the same while disposing said tool in engagement with a small supported log on said rolls, and means for rotating said tool.

2,771,923
VENEER JOINING MACHINE
Franz Terwegge, Bad Oeynhausen-Melbergen, and Karl Maschmeyer, Gohfeld Kreis Herford, Westphalia, Germany, assignors to Franz Terwegge Maschinenfabrik, Bad Oeynhausen-Melbergen, Germany, a firm
Application May 19, 1953, Serial No. 355,936
Claims priority, application Germany May 23, 1952
5 Claims. (Cl. 144—279)

1. In a veneer joining machine, a continuous veneer sheet conveyor having pressure and heating means for said sheet, a feeding table having laterally spaced continuously running friction feeding means for feeding veneer strips individually placed thereacross to the feed-in end of said conveyor, yieldably biased guide means over said table for wedging the leading edges of said individual strips as they approach said feed-in end and the exposed trailing edge of the last fed veneer strip so as to flatten said leading edges into alignment with said trailing edge, clutch means in said reduction gearing drive, and means responsive to the movement of said leading edges into closing relation with said trailing edge at said feed-in end for operating said clutch means until a new trailing edge enters said feed-in end.

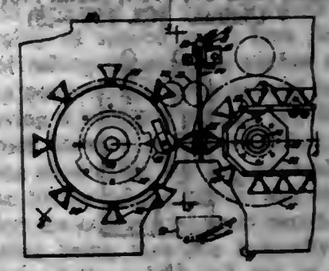
---



2,771,924
SURFACE MARKING TOOL
William E. Brownell, South Bend, Ind.
Application January 29, 1953, Serial No. 334,949
9 Claims. (Cl. 145—25)

1. A surface treating tool comprising a handle, a shank projecting from said handle and including a pair of spaced longitudinal rigid elongated portions interconnected by a rigid transverse portion at their outer ends, a head fixedly secured to said transverse shank portion and short compared to said spaced shank portions, a cutter pivotally carried by said head and movable in its plane and substantially parallel to said spaced shank portions, and means for locking said cutter in selected angular position in said head.

---

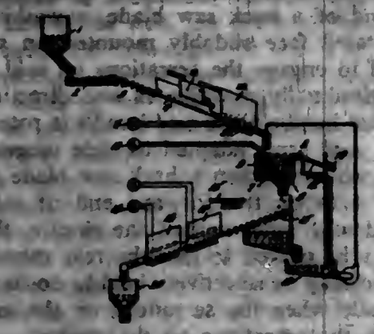


2,771,925
SAW BLADE HOLDER
Robert E. Littman, Flushing, N. Y.
Application August 15, 1955, Serial No. 528,287
1 Claim. (Cl. 145—106)

A means to hold a hack saw blade or the like comprising a frame and a handle, said frame having a backing member and an accurate rear member, said backing member being U shaped in cross section and adapted to accommodate a hack saw blade, said backing member having means adjacent its forward end to hold one end of a hack saw blade, said accurate rear member being formed of a pair of arms extending radially from said backing member, serrations on the outer edges of said arms, a threaded shuttle extending between said arms, said handle threadedly mounted on one end of said shuttle, means adjacent the other end of said shuttle to hold the other end of a hack saw blade, a washer having a radially serrated face slidably mounted on said shuttle and adapted to engage the serrations on said arms, said washer longitudinally movable in one direction on said shuttle by said handle when said handle is rotated around said shuttle, said arms adapted to slide tangentially past said shuttle whereby when a hack saw blade or the like is mounted between the forward end of said backing member and said other end of the shuttle, the backing member may be moved so that the rear member travels in an arc and may be selectively held in position by turning the handle when the serrations on the arms are in registry with the serrations on the washer.

---

2,771,926
EGG CRACKING MECHANISM
Charles H. Willsey, Topeka, Kans.
Application August 25, 1953, Serial No. 376,417
13 Claims. (Cl. 146—2)



10. An egg handling machine comprising a fixed supporting frame, a pair of spaced carrier members rotatably mounted on said frame, each of said carrier members having a series of shell gripping members supported thereon for movement in the same plane, means connected to said carrier members for rotating said carrier members continuously in timed relation to bring successive gripping members thereon into opposed cooperating shell gripping relation at a cracking station with opposite ends of eggs delivered to the gripping members of one of said carrier members, and an egg cracking device mounted on said supporting frame adjacent said cracking station and in spaced relation to said shell gripping members, said egg cracking device comprising a cracking blade, means for mounting said blade on said frame for movement between said gripping members in a plane which is substantially normal to the plane of operation of said carrier members and into cracking engagement with the successive eggs at said cracking station, and operating means connected to said blade to automatically move said blade toward said cracking station intermittently in timed relation to the movement of said carrier members to engage and crack the shell of each successive egg as it moves between said carrier members.

---

2,771,927
PROCESS FOR THE EXTRACTION OF THE CONTENTS OF NUTS, FRUITS, OR LIKE OBJECTS
Otto Thunissen, Ellenbosf, Transvaal, Union of South Africa
Application September 2, 1953, Serial No. 378,007
10 Claims. (Cl. 146—237)

1. A process for the treatment of objects of vegetable origin having an outer layer constituent covering internal constituents and both having a liquid content, to separate the constituent parts thereof, comprising the steps of subjecting the objects to a reduced temperature sufficiently low to solidify the liquid content of their outer layer constituents and seal the outer layer thereof, and thereafter heating them by an electrically generated high fre-

quacy field of sufficient intensity to cause explosive vaporization of the liquid contents of the internal con-

stituents of said objects, thereby bursting and detaching the outer layer, from the internal constituents.

---

2,771,928
POCKET CONTAINER
William E. Hoelle, St. Louis, Mo.
Application June 28, 1954, Serial No. 439,595
7 Claims. (Cl. 150—5)

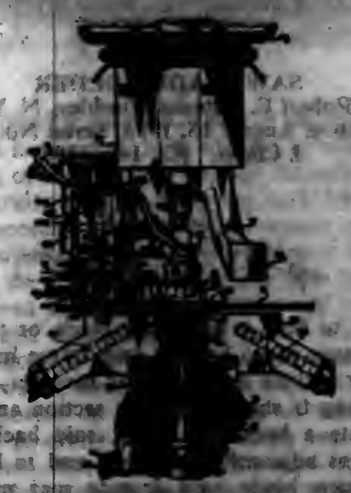
1. A receptacle for insertion in a clothing pocket or the like, comprising two sheets of relatively smooth-surface, stiff material, opposing one another with corresponding edges adjacent to each other, and a binding for said sheets consisting of a strip of relatively pliable, rough material covering a plurality of contiguous edges of said sheets and folded over the adjacent marginal portions of said sheets and securing said sheets together and adapted to resist sliding of the receptacle over the material of a pocket into which the receptacle is inserted, at least one pair of contiguous edges being exposed and providing for insertion of an object between the sheets.

---

2,771,929
ANTI-SKID AND ANTI-BOGGING DEVICE FOR TIRES
Joseph Alterio and Louis Alterio, Garfield, N. J.
Application January 17, 1955, Serial No. 482,825
2 Claims. (Cl. 152—232)

1. A combined anti-bog and anti-skid means comprising a tire casing section of a predetermined arcuate length, a second tire casing section of less arcuate length than said first section and superposed thereon, said second section having its ends equally spaced from corresponding ends of said first section, said first section being adapted for seating engagement with a tire mounted on a wheel and having means adjacent each end thereof for releasable engagement with the wheel, said second section having means intermediate its ends for releasable engagement with the wheel, an arcuate anti-skid device looped around said first section adjacent each end of said second section, and means for releasably securing the ends of said anti-skid devices to said second section at the opposite ends thereof.

---



2,771,930
TIRE CHAIN
Milton W. Pike, Omaha, Nebr.
Application August 20, 1953, Serial No. 375,379
2 Claims. (Cl. 152—243)

1. A tire chain for application to a mounted tire resting on the ground, which tire comprises a tread and side walls, said tire chain having interconnected chain links to provide flexible inner and outer side chains adapted to engage said tire side walls when applied to the tire, cross chains connecting said inner and outer side chains at intervals throughout their length, said outer side chain having separable ends, a slack adjuster interposed in the length of said inner side chain comprising an adjuster link connected to a link of said inner side chain and a lever arm pivotally connected to said adjuster link, said lever arm having an elongated slot in which another link of said inner side chain is received, said adjuster link and said lever arm being pivoted together and when said adjuster link and lever arm are in extended position said slack adjuster and said inner side chain constitute an endless inner side chain having a length corresponding, at least, to the circumference of a tire, said lever arm being adapted to be moved into parallel relation with said adjuster link for reducing the length and slack in said inner side chain so that said inner side chain will be of a circumference and length corresponding to the circumference of said tire inner side wall and for engagement therewith upon application of said tire chain to said tire, means for connecting said adjuster link and lever arm in parallel relation, and means for connecting the ends of said outer side chain together.

---

2,771,931
MACHINE FOR HOT DIMPLING
Edwin V. Christensen, Hollywood, Calif., assignor to Lockheed Aircraft Corporation, Burbank, Calif.
Application April 29, 1953, Serial No. 352,002
14 Claims. (Cl. 153—21)

1. In a dimpling machine including an anvil carrying a first die, a ram movable toward the first die, a shoe

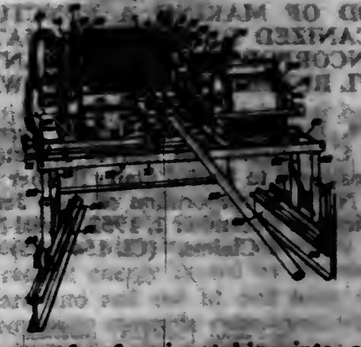
positioned between the ram and first die and movable toward the anvil means by the ram, and a second die carried by the shoe, the combination of a first heating means carried by the anvil to surround the first die to contact the lower surface of the workpiece to be dimpled, a second heating means movably carried by the shoe to be interposed between said second die and the upper surface of the workpiece and to be pressed against said upper surface by the ram, the second heating means being retractable out of alignment with the dies, and means for retracting said second heating means clear of the dies when ram pressure is released to clear the dies for the dimpling operation.

---

2,771,932
TUBE BENDING MACHINE
Ray A. Sandberg, Waukegan, Ill., assignor to Houdaille-Hershey Corporation, Detroit, Mich., a corporation of Michigan
Original application July 11, 1950, Serial No. 173,083. Divided and this application February 26, 1953, Serial No. 339,071
2 Claims. (Cl. 153—67)

2. In a winding apparatus, an elongated winder plate, a first mandrel carried at one end of said winder plate on one side thereof, second and third mandrels carried at the opposite end of said winder plate at said one side thereof to define with said first mandrel and said winder plate a generally triangular winding frame, said winder plate having means on said one side thereof for positioning an initial length of tubing or the like to extend from between said second and third mandrels and around said first mandrel, and means for winding tubing or the like on said mandrels with said initial length of tubing or the like positioned by said means and with the adjacent portion of the tubing or the like extending around the mandrels in close relation to said winder plate.

---



2,771,933
BODY TOOL
Ralph J. Edwards, Knoxville, Tenn., assignor of fifty per cent to Oscar E. Thigpen, Knoxville, Tenn.
Application March 24, 1955, Serial No. 496,374
5 Claims. (Cl. 153—32)

1. A body tool for removing dents from vehicles, said body tool comprising a head, a work piece engaging sealing strip carried by said head at the peripheral edge of said head, said sealing strip projecting from said head to form a pocket between said head and a work piece, and means carried by said head for producing a vacuum in said pocket to draw indented portions of a vehicle body aligned with said pocket.

---

2,771,934
APPARATUS FOR FORMING TUBING INTO COILS
Harold W. Payne, San Bernardino, Calif., assignor to Vapor Heating Corporation, Chicago, Ill., a corporation of Delaware
Application June 28, 1951, Serial No. 233,968
3 Claims. (Cl. 153—67)

1. An apparatus for forming tubing into coils comprising a supporting structure, a winding arbor rotatably mounted in said structure and provided with means comprising a plurality of spaced apart bars for supporting convolutions of tubing thereon, an anchor element having a rigid ring portion embracing an end portion of the tubing and having a recessed portion providing a hook-shaped jaw which fits over and frictionally clamps a portion of a tubing supporting bar for releasably attaching one end of the tubing to the arbor, and means for rotating said arbor, the said spaced apart bars for supporting said convolutions being movable inwardly toward the longitudinal axis of the arbor and out of contact with the formed tubular coil to facilitate removal of said coil.

---

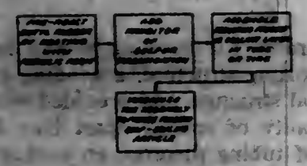
2,771,935
METHOD AND APPARATUS FOR BUNDLING CORRUGATED CARDBOARD BLANKS
Ludwig Clemens, Wiesbaden, Germany
Application May 26, 1954, Serial No. 432,508
Claims priority, application Germany June 3, 1953
3 Claims. (Cl. 154—1.6)

1. A method for bundling a plurality of adjacent strip-shaped longitudinally extending corrugated cardboard blanks comprising, assembling said blanks into a staple of loosely superposed cardboard blanks, conducting said staple into and through a staple holding and guiding means, applying adhesive to a limited area of the upper and lower longitudinal surfaces of said staple on the cut-off upper and lower edges of the loosely superposed blanks thereof during the passage of said staple through said holding and guiding means, the application of the adhesive being restricted to the edges of a few outer blanks on each side of the staple, thereupon applying paper webs onto the adhesive coated longitudinal surfaces of said staple, the width of said paper webs being slightly greater than the width of the staple surfaces, the paper webs thereby projecting slightly over the edges of said staple.

3. Apparatus for adhesively bundling a plurality of longitudinally extending cardboard blanks comprising means for assembling said blanks into a staple of loosely superposed longitudinally extending cardboard blanks, staple holding and guiding means into which the assembled staple is guided and held as loose blanks with the edges in an upward position, edge adhesive applying means fitted with elevated portions of limited area to apply adhesive from said limited area to the upper and lower sides of said staple, said area of adhesive applica-

tion being smaller than the area of the upper side and lower side of the staple, respectively, and a horizontal pressing member for pressing a paper strip from a paper supply onto said upper and lower adhesively coated sides of said staple.

---



2,771,936

**METHOD OF MAKING A PUNCTURE-SEALING VULCANIZED RUBBER PNEUMATIC ARTICLE BY INCORPORATING A SEALANT LAYER OF BUTYL RUBBER PRE-REACTED WITH A CURATIVE**

Alfred N. Sampsen, Grosse Pointe Farms, Mich., and Lester C. Peterson and Harvey J. Batts, Indianapolis, Ind., assignors to United States Rubber Company, New York, N. Y., a corporation of New Jersey

Application December 2, 1952, Serial No. 323,662

8 Claims. (Cl. 154—15)

1. In a method of making a puncture-sealing pneumatic article comprising an annular air-impervious rubber envelope having incorporated in at least its crown portion a layer of plastic sealant material which is a reaction product of (1) a synthetic rubbery copolymer of an isoolefin having from 4 to 7 carbon atoms with from 0.5 to 10% of an aliphatic conjugated diolefin having from 4 to 6 carbon atoms and (2) a curative for said rubbery copolymer in amount of from 0.1 to 2.5 parts by weight, per 100 parts of said rubbery copolymer, said reaction product being made by heating the said reactants (1) and (2) in intimate admixture at a temperature of from 200° to 400° F. for from 5 to 45 minutes, the improvement which comprises the step of carrying out said heating of said reactants prior to incorporating the said sealant layer in the said air-impervious rubber envelope and prior to the vulcanization of the assembly, and then vulcanizing the assembly.

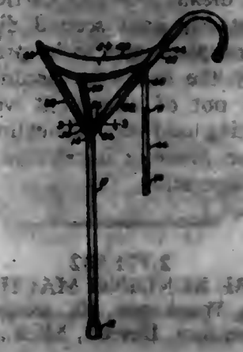
**TABLE-BENCH HAVING MEANS FOR CONTROLLING AND GUIDING THE FOLDING THEREOF INTO FOLDING POSITION**

Kermit H. Wilson, Minneapolis, Minn.

Application March 4, 1955, Serial No. 492,212

2 Claims. (Cl. 155—124)

1. In a folding table and bench unit, a supporting structure, a table top, mechanism connecting the table top to the supporting structure and guiding the same for swinging movements from a generally horizontal operative position to a generally vertical storage position, a bench section supported by said supporting structure in an operative position adjacent the longitudinal edge of the table top but below the plane of the latter when the latter is in its horizontal position, and means comprising rigid elements and connecting pivot joints anchoring the bench section to the table top for swinging movements from said operative position to an inoperative position adjacent and in substantially flat face to face relationship with one of the surfaces of the table top.



2,771,938

**SEAT CANE**

William G. Nehlich, Rochester, N. Y.

Application October 20, 1955, Serial No. 541,773

3 Claims. (Cl. 155—135)

1. A combined walking stick and seat comprising a staff having a ground engaging member at one end and three arms pivotally attached at the other end on axes extending transversely of the staff, means to limit the pivotal movement of the arms between a position parallel with said staff and a position angularly disposed with reference to the staff, said means comprising a pair of abutments on each of said arms, one abutment of each pair being adapted to engage the end of the staff, and the other the side wall of the staff below said pivotal means a triangular flexible seat secured to each of the arms, one of said arms being extended and formed to provide a handle, and means for binding all of said arms together when disposed in parallel relation said abutments engaging the end of said staff and serving together with said binding means to render said three arms as a rigid extension of said staff.

---

2,771,939

**FURNITURE SLIP COVERS**

Philip S. Trubitt, Chicago, Ill., assignor to Sears Roe, Chicago, Ill.

Application July 29, 1954, Serial No. 446,573

2 Claims. (Cl. 155—182)

1. A slip cover for the back of an article of furniture comprising a front and a rear panel connected together at the upper edges for covering the front and rear surfaces of the back rest of an article, a pair of shoulder flaps each secured to the upper portion of a lateral edge of the front panel and extending into free underlapping relation with the corresponding edge of the rear panel and extending outwardly and terminating in a free outer edge arranged to hang pendant about the shoulder of an article on which the cover is placed, and a pair of side flaps each secured to a lateral edge of the upper portion of the front panel below and in overlapping relation with the corresponding shoulder flap and extending downwardly into free underlapping relation with the front panel and outwardly to overlap the free edge of the adjacent shoulder flap as the side flap is passed about the side edge of the article back to the rear surface of the article, and means for attaching said side flaps in position at the article back.

2,771,940

**CHAIRS**

Warren J. Peterson, Ludington, Mich., assignor to Curtiss Industries, Inc., Ludington, Mich., a corporation of Michigan

Application June 28, 1956, Serial No. 593,416

5 Claims. (Cl. 155—191)

1. A chair comprising a seat frame including a pair of side rails and spaced apart rearward and forward cross members joined to the side rails, a pair of arms positioned above the side rails, a pair of upstanding front legs respectively joined at their upper ends to the arms, said front legs also being respectively joined to the side rails, a rear frame including a pair of co-planar upstanding rear legs, said arms and said side rails being joined to said upstanding rear legs, an upper back-frame forming member joining the rear legs, a lower back-frame forming member joining the arms, said upper and lower back-frame forming members being parallel, said lower back-frame forming member being positioned forwardly of and out of the plane formed by the rear legs, and a pair of co-planar side members converging toward each other and joined to the upper and lower back-frame forming members, whereby a triangulated bracing structure is formed and the seat and rear frames are maintained in a rigid, stable condition when a force is applied in any direction.

2,771,941

**TIRE BEAD BREAKER WITH RIM CLAMPING MEANS**

Anthony B. Mastropolo, Penns Grove, N. J.

Application January 15, 1954, Serial No. 404,333

1 Claim. (Cl. 157—1.17)

A tire demounting tool comprising an elongated housing, a pair of spaced parallel fingers secured to one end of said housing and extending from one side thereof substantially transverse to the longitudinal axis of said housing, a ram slidably mounted in said housing, means mounted on the other end of said housing and connected to said ram for urging said ram longitudinally in said housing, a finger on said ram extending parallel to and positioned between said first named fingers, locking means mounted adjacent said one end of said housing for securing the tool in position on a wheel or rim, said locking means including a pair of members pivotally secured at one of their ends to said housing on the side opposite to the direction in which said fingers extend, said members extending in the same direction as said fingers and having a hook portion provided on the other end thereof and overlying said fingers, and a stop member fixedly secured to said housing, said stop member limiting the movement of said members away from said fingers, a hook positioning lever pivotally connected intermediate its ends to said members adjacent the hook portion thereof and spaced from the housing, one end of said lever having a rim-engaging portion, the other end constituting a handle whereby said rim-engaging portion can be positioned against the inner face of the rim and said handle actuated to draw said hook portion into locking position with said rim and said fingers between the flange of said rim and the bead of the tire.

2,771,942

**APPARATUS FOR DETECTING AN IGNITION ARC AND CONTROLLING A BURNER**

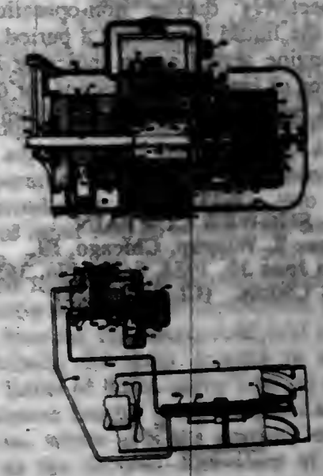
William E. Miller, Youngstown, Ohio

Application February 24, 1954, Serial No. 412,244

1 Claim. (Cl. 158—28)

A burner control system including a burner having an outlet, fuel delivery means for said burner and ignition electrodes at said outlet, a photocell responsive to fluctuations of radiant energy positioned to scan only an area to one side of a straight path between the tips of said ignition electrodes whereby said photocell receives fluctuations of radiant energy caused by the movement of an ignition arc into and out of said area, a circuit including an electrically operable valve controlling said fuel delivery means, a tuned amplifier having an input circuit connected to said photocell and selectively responsive to the frequencies of said fluctuations, a power source for said amplifier, a relay including a coil connected to an output circuit of said amplifier for actuation by the output current of said amplifier upon occurrence of said fluctuations, a power source for said valve circuit, said relay having a switch in said circuit controlling said valve.

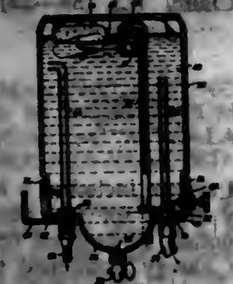
---



2,771,943

**OIL BURNER**

Herbert J. Wiser, Sr., Bloomington, Ill., assignor, by mesne assignments, to Hoover Motor Company, Inc., New York, N. Y., a corporation of New York



Application February 20, 1952, Serial No. 272,540

4 Claims. (Cl. 158—36.5)

4. An oil burner comprising an oil pump having an inlet and an outlet, a by-pass between said inlet and outlet, normally closed valve means and a restriction in said by-pass in the order named operative to resist flow of oil therethrough during operation of said pump thereby to create a pressure differential between said inlet and outlet, an oil atomizing nozzle connected to said by-pass between said valve means and said restricted passage so as to be supplied with oil from said pump when said valve means is open, a normally closed valve connected to said valve means and in the connection between said nozzle and said by-pass, and actuating means connected to said pump outlet and to said valve means for opening said valve means and said valve in response to a predetermined pressure in the oil discharged by said pump.

2,771,946
**EMERGENCY FUEL RESERVOIR AND GAUGE**
Earl W. Thornburg, Des Moines, Iowa
Application December 26, 1951, Serial No. 263,343
5 Claims. (Cl. 123—26.4)

1. A fuel container for disposition intermediate the fuel pump and carburetor on an internal combustion engine, said container having an inlet and outlet in the bottom thereof, said inlet adapted to communicate with the fuel pump for receiving fuel therefrom, said outlet adapted to communicate with the carburetor, a vertical standpipe within said container that connects to said outlet so that fuel moving out of said container to the carburetor must pass through the length of said standpipe, an open top pipe vertically disposed within said container and connected to said inlet, said pipe terminating within said container at a higher plane than said standpipe, said standpipe provided with an inlet communicating with the interior of said container at a point below its normal inlet, a manually operated valve means operatively associated with said lower inlet in said standpipe to control the communication between the interior of said container and the interior of said standpipe at the level thereof, and automatic valve means responsive to the liquid level within said container to limit the maximum liquid level therein at a point higher than the top of said pipe, said pipe, and standpipe respectively providing drainage outlets for liquid in said container to the fuel pump and carburetor respectively during non-operation of the engine whereby the liquid level after a period of non-operation of the engine serves as an indicator to expedite locating the source of leakage, and means for determining said liquid level within said container from exteriorly thereof.

2,771,945
**SHOWER CURTAIN**
James B. Wistrup, Chicago, Ill.
Application June 30, 1953, Serial No. 365,060
2 Claims. (Cl. 160—124)

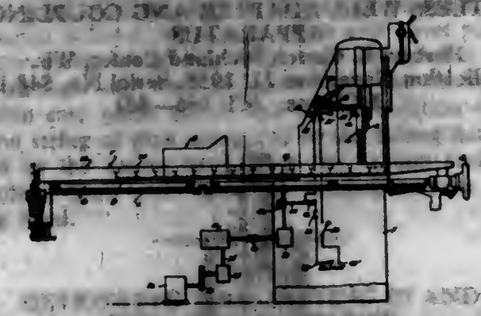
1. A sectional curtain for closing off a space between two wall portions and a bath tub disposed between said wall portions, said curtain being adapted to be slidably supported on a horizontal slide rod, comprising two individual parts each part including means for slidabty engaging a supporting rod, a slide fastener for fastening said two parts together along adjacent edges thereof, said slide fastener being operable from either side of the curtain, a continuous strip of tacky material along the outside edges of said curtain parts and across the lower portions of said curtain parts on the outwardly facing side of said curtain, whereby said curtain parts may be secured together by said slide fastener, said tacky material effecting a continuous seal along the adjacent walls and to the inside of the tub.

2,771,946
**REPLACEMENT FOR VENETIAN BLIND SLAT-SUPPORTING STRAP**
John J. Dinan, Sr., Dorchester, Mass.
Application February 1, 1954, Serial No. 407,237
2 Claims. (Cl. 160—178)

1. A replacement for a Venetian blind slat-supporting strap consisting of a thin narrow strip of sheet metal, the opposite ends of which are formed with a plurality of bendable pointed tongues adapted to pierce the tapes of the blind and provide a support for one end of a slat, the length of the body portion of the strip between said tongues being substantially equal to the width of the slats of the blind.

2,771,947
**CUTTING STICK AND METHOD OF CUTTING PAPER USING SAME**
Ralph Coffey, Brentwood, Md.
Application December 28, 1954, Serial No. 478,265
6 Claims. (Cl. 164—17)

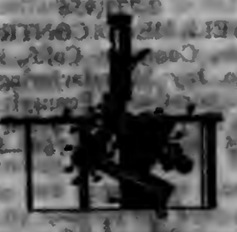
1. In a cutting machine having a cutting knife, a cutting bed disposed therebeneath, said knife being movable toward and away from said bed, said bed having holding means for a cutting stick disposed beneath said cutting knife and a cutting stick disposed in said holding means for cooperation with said knife, the improvement wherein said cutting stick is an elongated body having knife engaging surfaces, said body consisting essentially of a material of the nature of ethylene homopolymers characterized by short chain branching in the polymer structure and having a density of from about 0.92 to about 0.95 gram per milliliter, a stiffness above about 25,000 pounds per square inch, and a logie melt viscosity at 190° C. in centipoises of between about 6 and about 9.



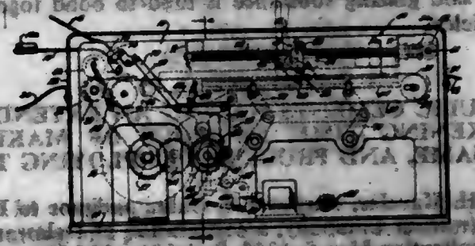
6. The method of cutting paper and paper-like sheets which consists of placing a plurality of said sheets in stacked relation upon a supporting surface, cutting said stacked sheets with a knife in a plane extending transversely of said stacked sheets, supporting said stacked sheets at the base thereof coextensive of the plane in which said sheets are cut with a resilient rigid body consisting essentially of ethylene homopolymers characterized by short chain branching in the polymer structure and having the following average properties:

| | |
|---|---|
| Logie melt viscosity at 190° in centipoises | 6.0 |
| Density at 23° C. in grams per milliliter | 0.92 |
| Stiffness at 73° F. in p. s. i. (Tinius-Olsen, ASTM D747–50) | 27,000 |
| Tensile strength at 73° F. in p. s. i. ASTM D412–51T) | 1,750 |
| Yield point at 73° F. in p. s. i. (ASTM (D412–51T) | 1,700 |
| Elongation at 73° F. percent (ASTM D412–51T) | 600 |

whereby said knife in cutting said body at the same time said stacked sheets are cut forms cuts in said body which close after being cut, said body remaining free of extraneous matter.



2,771,948
**CUTTING KNIFE-STACK SUPPORT**
Carl Thunston, Lansdowne, Pa., assignor to E. P. Lawson Co., Inc., New York, N. Y., a corporation of New York
Application December 12, 1952, Serial No. 325,625
4 Claims. (Cl. 164—51)



2. In a cutting machine including a table for supporting paper stock to be cut, a clamp and cutting knife movable independently toward and away from a supporting surface of said table, a back gauge adjustable along said table relative to said knife, said supporting surface being provided with air admission ports adapted to supply an air cushion beneath paper stock supported thereover, a valve including a depressible operating member projecting above said supporting surface and normally constricting each of said ports, a source of air under pressure, a conduit system interconnecting said source and the respective ports, a normally closed, electrically operated, air admission valve in said conduit system, and an energizing circuit for said air admission valve including disabling means operative in response to movement of either said clamp or said back gauge and precluding opening of said normally closed air admission valve.

2,771,949
**SHEARING DEVICE USED IN EMBROIDERY TRIMMING MACHINE**
Victor I. Spada, Great Neck, N. Y., assignor to Man-Sew Corporation, New York, N. Y., a corporation of New York
Application February 16, 1953, Serial No. 336,919
3 Claims. (Cl. 164—79)

1. A shearing device comprising a rotatable shaft mounted in a plane inclined to the vertical, a circular cutter carried thereby, said cutter having a shear face normal to the axis of rotation and a peripheral shear edge on said shear face, a second shaft mounted in a plane parallel to and in advance of the plane of said shear face, a ledger blade support pivotally mounted on said second shaft, a ledger blade on said support having a shear edge which extends over said pivotal mounting in advance of and in engagement with the upwardly facing shear edge of the cutter, said arrangement tending to bring the ledger blade shear edge into closer engagement with the shear edge of the cutter as drag is exerted by the work in resisting shear.

2,771,950
**SNAP-OUT FORM SEPARATOR**
Frederick J. Smith, Newington, Conn., assignor, by mesne assignments, to Anthony G. Werner, West Hartford, Conn.
Application August 6, 1952, Serial No. 302,935
16 Claims. (Cl. 164—64.5)

1. A device for separating form sheets from a snap-out assembly comprising, a transverse abutment on said device, traversing means to advance said assembly against said transverse abutment to stop the advancing movement of said assembly, gripping means on said transverse abutment to engage the forward edge of said assembly, means to momentarily bend the intermediate portion of said assembly, a pair of closely adjacent rotating rollers, guiding means to present the trailing edge of said assembly between said rotating rollers when released by said bending means to sever the form sheets from said assembly, whereby one portion of said assembly will be ejected by said rollers, and means to release the forward edge of said assembly from said gripping means, whereby the remaining portions of said assembly will be ejected by said traversing means.

2,771,951
**METHOD OF OIL RECOVERY BY IN SITU COMBUSTION**
Clarke N. Sloan, Fullerton, Calif., assignor to California Research Corporation, San Francisco, Calif., a corporation of Delaware
No Drawing. Application September 11, 1953, Serial No. 379,729
3 Claims. (Cl. 166—11)

1. The method of recovering gas and oil from a subterranean formation containing a petroliferous deposit and penetrated by at least one input well and at least one adjacent output well, comprising the steps of heating said formation adjacent said input well to a sufficiently elevated temperature to establish a combustion zone in said deposit, introducing free oxygen into said formation through said input well to support the combustion in said combustion zone and to move said combustion zone through said formation while maintaining the portions of said formation adjacent said combustion zone at a temperature less than the temperature of said combustion zone, and maintaining the mass velocity of said free oxygen within the limits of 0.016 $\phi S$ to 1.08 $\phi S$ pound moles per hour per square foot of cross-sectional area of said combustion zone, where $\phi$ is the porosity of said formation expressed as the decimal equivalent of the ratio of the actual formaion porosity to unit porosity, and S is the oil saturation of said formation expressed as the decimal equivalent of the ratio of the actual oil saturation in the formation to complete saturation, while recovering gas and oil from said output well.

2,771,952
**METHOD OF CONSOLIDATING SUBTERRANEAN FORMATIONS**
Clarke N. Sloan, Fullerton, Calif., assignor to California Research Corporation, San Francisco, Calif., a corporation of Delaware
No Drawing. Application August 24, 1953, Serial No. 376,263
4 Claims. (Cl. 166—12)

1. A method for consolidating the particles of an incompetent sand formation encountered in a well bore

comprising the steps of introducing into said well bore adjacent said formation a mixture comprising a glazing substance and a combustible fuel, initiating combustion in said fuel in said mixture, and supplying a combustion gas to said mixture to maintain said combustion at a sufficiently elevated temperature to fire said glazing substance, whereby said glazing substance is fired to bond together said particles.

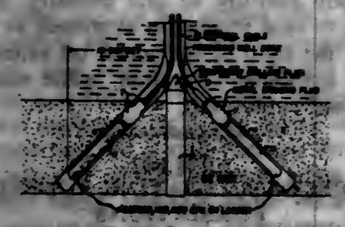
2,771,953

## HYDRAULIC CEMENTS HAVING AN EXTENDED THICKENING TIME, METHODS OF MAKING THE SAME, AND PROCESSES EMPLOYING THE SAME

Herman H. Kaveler, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware

Application May 5, 1952, Serial No. 286,131
11 Claims. (Cl. 166—31)

11. The process of cementing a well which extends into a pervious formation which comprises placing a Portland cement aqueous slurry having a reduced water-loss adjacent to said pervious formation by admixing with Portland cement from 0.05 to 5% by weight of the dry cement of a Portland cement slurry water-loss reducing agent selected from the group consisting of said cellulose sulfate and salts of acid cellulose sulfate, mixing therewith sufficient water to produce a fluid slurry, and introducing said slurry into said well into contact with said pervious formation.



---

2,771,954

## TREATMENT OF PETROLEUM PRODUCTION WELLS

Loren H. Jenks and Ray J. Stancliff, Jr., Tulsa, Okla., assignors to Esso Research and Engineering Company, a corporation of Delaware

Application April 29, 1953, Serial No. 351,924
6 Claims. (Cl. 166—39)

4. A method for increasing the rate of production of oil from a producing well that penetrates a producing formation which comprises drilling and spacing a plurality of auxiliary bore holes about the producing well and within the producing formation, introducing heat into part of the formation from each of said auxiliary bore holes while preventing flow of fluids within the auxiliary bore holes, spacing each auxiliary bore hole from the producing well a distance such that the part of the formation heated lies in the immediate vicinity of the producing well, and withdrawing oil from the formation through the producing well.

---

2,771,955

## PITLESS WELL ADAPTER AND COUPLING APPARATUS

Herbert E. Carter, Richland Center, Wis.

Application November 21, 1955, Serial No. 548,112
5 Claims. (Cl. 166—85)

1. A pitless well adapter and coupling apparatus comprising a generally hollow adapter fitting having an inlet and an outlet and providing a connector flange at its inlet, a generally hollow coupler member having an inlet adapted to be connected to a pump supply pipe and an outlet forming a mounting lip, riser means secured to said coupler member and adapted to extend upwardly through a well casing, lever means pivotally mounted on said coupler member, and an elongated operating member carried by said riser means and secured to said lever means, said lever means being operative when actuated by said operating member to tightly engage said coupler mounting lip against said adapter connector flange and effect flow interconnection thereof entirely within a well casing.

---

2,771,956

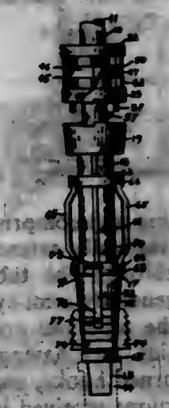
## WELL HEAD CONTROL

Glenn D. Johnson, Compton, Calif., assignor, by mesne assignments, to Joy Manufacturing Company, Pittsburgh, Pa., a corporation of Pennsylvania

Application May 13, 1953, Serial No. 354,901
15 Claims. (Cl. 166—88)

1. In apparatus for facilitating well head operations wherein the surface equipment includes a blowout preventer above a casing head, the provision of: a casing head adapted to be connected to casing, the upper portion of said casing head including an outwardly and upwardly expanding frusto-conical landing surface; a guide

spool supported on said casing head and below a blowout preventer, said guide spool including inwardly and longitudinally extending guide ribs with fluid channels therebetween; a tubing head adapted to be passed through a blowout preventer, said tubing head having a through bore, means carried by the lower portion of the tubing head for connecting the same with a string of pipe and including a downwardly directed, conical seating surfaces provided with seal means adapted to seat on the landing surface of said casing head, an upper portion provided with a coupling means and an outwardly and upwardly flaring entry portion, and a removably plugged lateral production outlet between said upper and lower portions, whereby rising circulating fluid may bypass the tubing head through said fluid channels when the tubing head is within said guide spool, and said circulation shut-off and the string of pipe connected to the tubing head supported by the casing head when the seating surface of the tubing head rests upon the landing surface of the casing head.



---

2,771,957

## RETRIEVING TOOL FITTING IN AND ENGAGING WASH PIPE

John Hugh Weber, Abilene, Tex.

Application December 9, 1954, Serial No. 474,197
7 Claims. (Cl. 166—218)

1. A grip against rotation fitting inside of a pipe, comprising a longitudinal shank, a sleeve fastened on said shank having a plurality of cam surfaces each increasing in distance from the axis in one direction of rotation, a slip for each cam surface adapted to slide thereon having extensions upward and downward beyond said cam surfaces and having longitudinal teeth to engage the inside of the pipe, means fastened to said shank disposed above and below said cam surfaces for guiding said extensions as each of said slips slides on its cam surface, a wiping finger extending transverse to the axis attached to each slip at one end having the free end adapted to be pressed outwardly to bring the wiping finger into frictional contact with the inside of the pipe, said sleeve having a groove cut longitudinally in each cam surface, a wedge pin having a thin portion and a thick portion mounted to slide in each groove from the point where a thin portion of the pin underlies the free end of the wiping finger to the point where a thick portion thereof underlies and presses outward the free end of the wiping finger, means fastened to said shank disposed below said cam surfaces for guiding each of said wedge pins in its groove and a member slidable on said shank having wiper strips attached contacting the inside of the pipe and having at one end a normal surface to contact said wedge pins and move each pin in its groove to where its thick portion underlies the end of the wiping finger.

2,771,958

## HYDRAULIC DRIVE WITH PRESSURE EQUALIZER AND CONTROL FOR PLURAL MOTORS

Charles F. Ball, Franklin, Pa., assignor to Joy Manufacturing Company, Pittsburgh, Pa., a corporation of Pennsylvania

Application December 7, 1953, Serial No. 396,508
6 Claims. (Cl. 180—6.48)

1. In combination, a pair of ground-engaging vehicle-supporting and propelling elements, a reversible hydraulic driving motor individual to one of said elements, a reversible hydraulic driving motor individual to the other of said elements, a power operated pump, a flow divider comprising a pair of motor-pump devices connected to turn together and each having a fluid discharge, fluid supply connections between said pump and said pair of motor-pump devices comprised by said flow divider, a fluid supply connection leading from one of said fluid discharges, a fluid supply connection leading from the other of said discharges, a control valve to which one of said fluid supply connections leads, a control valve to which the other of said fluid supply connection leads, a pair of alternatively fluid supply and fluid exhaust connections leading from one of said control valves to one of said reversible hydraulic driving motors and a pair of alternatively fluid supply and exhaust connections leading from the other of said control valves to the other of said reversible hydraulic driving motors, each of said control valves having means for supplying fluid to either of its associated alternatively fluid supply and exhaust connections or to interconnect the latter while precluding fluid supply to either of them.

---

2,771,959

## SHARP-TOOTHED TIRE ENGAGING MEMBERS FOR DRIVING VEHICLE WHEELS

William H. Phelps, Raldon, Nebr.

Application February 19, 1954, Serial No. 411,482
6 Claims. (Cl. 180—74)

1. In a drive mechanism for a wheeled vehicle: a drive tire on a wheel of the vehicle which is composed of relatively soft, resilient material and has an effectively smooth running surface; and a drive shaft provided with a drive gear adapted to engage the running surface of the tire, said gear having teeth which present a sharp forward edge which bites into the tire as the gear rotates to push up a sharply angled ridge of tire material ahead of each tooth as it engages with the tire against which the tooth exerts its driving force.

---

2,771,960

## INTERVAL VELOCITY SEISMIC LOGGING

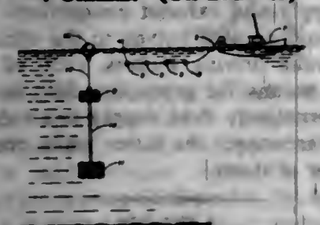
Neal J. Smith, New Orleans, La., assignor to California Research Corporation, San Francisco, Calif., a corporation of Delaware

Application September 11, 1951, Serial No. 245,956
7 Claims. (Cl. 181—5)

1. An apparatus for determining the velocity of an elastic wave through a subsurface formation penetrated by a well bore, comprising, in combination, a generator for elastic waves having an approximately radially extend-

ing cavity for explosive facing a segment of said well bore, a cable for suspending said generator at a predetermined

point in said well bore, a seismometer suspended by said cable, and an elastic wave absorber between said generator and said seismometer.



---

2,771,961

## METHOD OF INITIATING UNDERWATER SEISMIC DISTURBANCES

Francis G. Blake, Jr., Fullerton, Calif., assignor to California Research Corporation, San Francisco, Calif., a corporation of Delaware

Application July 27, 1955, Serial No. 524,658
4 Claims. (Cl. 181—.5)

1. A seismic source for offshore seismic exploration comprising a first and second explosive source, means for positioning said first explosive source above said second explosive source, means for detonating said explosive sources simultaneously, the potential energy of said explosive sources being related to their positions in the water according to the following relationship:

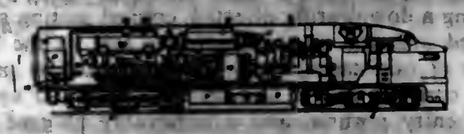
$$\frac{W_1^2}{(D_1+33)^5}=\frac{W_2^2}{(D^2+33)^5}$$

where

$W_1$=the potential energy of the first explosive source
$W_2$=the potential energy of the second explosive source
$D_1$=depth below the surface of the first explosive source
$D_2$=depth below the source of the second explosive source,

said first and second explosive sources being spaced apart by a distance greater than the sum of the maximum radii of the two explosive bubbles and within the range of Bjerknes forces.

---



2,771,962

## RECYCLING, PRESSURIZED VORTICAL WHIRL SEPARATOR, CONCENTRATOR AND ASH STORAGE SYSTEM FOR POWDERED COAL-BURNING GAS TURBINE POWER PLANTS

John I. Yellott, New York, and Frederick D. Buckley, Fredonia, N. Y., assignors to Bituminous Coal Research, Inc., Washington, D. C., a corporation of Delaware

Application January 29, 1953, Serial No. 334,652
5 Claims. (Cl. 183—34)

1. Recycling separator, concentrator and storage system of the character described, comprising, in combination, a source of pressurized particle-bearing gasiform fluids; a first separating means coupled to said source, and including at least one reverse flow vortical whirl separator having an axially apertured bottom; a tangential blowdown line for blowdown fluid-borne separated particles adjacent to the bottom; an ash concentrator comprising a second reverse flow vortical whirl separator, of lesser

capacity than said first separating means coupled to the first said blowdown line; duct means for recycling cleaned gas from said ash concentrator to the bottom axial aperture of the first separator; a second blowdown line discharging concentrated separated particles in a blowdown stream of gas from the ash concentrator; and means for receiving and storing the said concentrated blowdown residues.

---

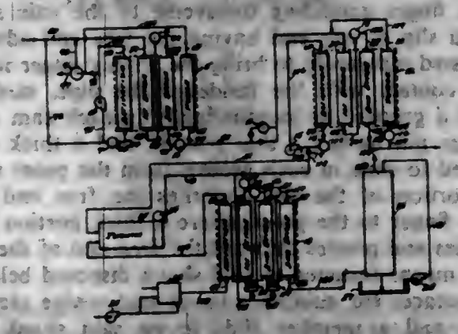
2,771,963

## AIR CONDITIONING UNIT AND AIR FILTER THEREFOR

Robert Warren Eichorn, Marshalltown, Iowa, assignor to Lennox Industries, Inc.

Application December 24, 1953, Serial No. 400,228
2 Claims. (Cl. 183—49)

1. An air conditioning unit comprising in combination: a housing defining a vertically extending tube; means to impel air vertically through the tube to condition the same; an air filter of generally semi-cylindrical conformation disposed within the tube and oriented to receive air flow on its convex side and having marginal portions in the form of downturned hooks; and rails on the housing having tongue portions received in the marginal portions of the filter, the rails further having imperforate hood portions extending over the ends of filter and partially along the concave face thereof to form a seal.



---

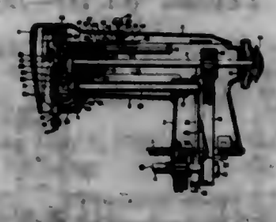
2,771,964

## METHOD OF RECOVERING $H_2S$ FROM NATURAL GAS

Ernest B. Miller, Houston, Tex., assignor to Jefferson Lake Sulphur Company, New Orleans, La., a corporation of New Jersey

Application April 13, 1953, Serial No. 348,304
8 Claims. (Cl. 183—114.2)

1. In the removal and recovery of $H_2S$ from natural gas containing $H_2S$ involving the contact of adsorbent material with the natural gas from which water vapor and condensable hydrocarbons have previously been removed therefrom with resultant adsorption of the $H_2S$ by the adsorbent material and the subsequent treatment of the adsorbent material with a heated medium to vaporize and remove the $H_2S$ and thereby reactivate the adsorbent material for further contact with the natural gas, the improvement which comprises providing at least one bed of adsorbent material in each of a plurality of zones; continuously heating and recycling a flow of a gas consisting substantially of $H_2S$ under high pressure through at least one of said zones to remove the $H_2S$ contained in the adsorbent material therein and reactivate the adsorbent material; directing a continuous flow of the natural gas under high pressure through the remainder of said zones so that the $H_2S$ content of the gas will be adsorbed by the adsorbent material therein; periodically shifting the relative position of the particular adsorbent material and the particular flow of fluid in each of said zones so that each zone becomes, in succession, a reactivation zone and an adsorption zone; and continuously withdrawing a portion of the hot $H_2S$ gas from the recycling path.



---

2,771,965

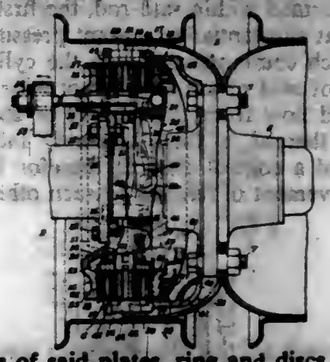
## SEWING MACHINE LUBRICATION

Frank Parry, Trumbull, and Ivan E. Snyder, Bridgeport, Conn., assignors to The Singer Manufacturing Company, Elizabeth, N. J., a corporation of New Jersey

Application December 15, 1953, Serial No. 398,275
2 Claims. (Cl. 184—6)

1. In a sewing machine having a bracket-arm shaft and a take-up mechanism actuated thereby, means for lubricating said bracket-arm shaft and said take-up mechanism comprising a pair of lubricant-holding elements including a lubricant distribution point and a lubricant reservoir, wicks leading from said distribution point to said bracket-arm shaft and to said take-up mechanism, a cantilevered leaf spring having the free end thereof normally overhanging one of said lubricant-holding elements, a wick carried by said spring substantially longitudinally thereof and having one end disposed adjacent the free end of said spring and the opposite end disposed in contact with the other of said lubricant-holding elements, and manually-operated means for depressing the free end of said spring and for holding the same down against the resilient action thereof.

---



2,771,966

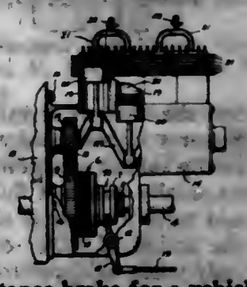
## AXIAL DISC BRAKE

George M. Davey, Downey, Calif., assignor to Hadco Engineering Co., Inc., Huntington Park, Calif., a corporation of California

Application April 5, 1954, Serial No. 420,810
10 Claims. (Cl. 188—72)

1. A brake comprising a rotationally mounted housing drum, two spaced brake discs rotationally carried by the drum, means connecting said discs and said drum and slidingly engaged with the inner face of said drum, a non-rotational backing plate on one side of one of said brake discs, a pressure plate on the opposite side of the other brake disc, a center ring between the discs, link means non-rotationally connecting said center ring and the backing plate and the center ring and the pressure plate, and means pivotally mounted on the backing plate and connected to the pressure plate to move and press

the lateral faces of said plates, ring and discs together to arrest rotation of the housing drum.



---

2,771,967

## INTERNAL RESISTANCE BRAKE WITH CLUTCH

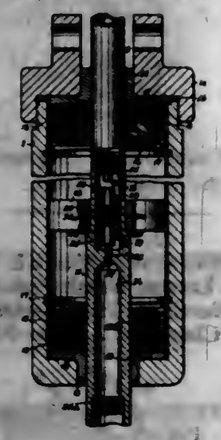
Edwin B. Larson, Brush Prairie, Wash.

Application March 18, 1954, Serial No. 417,123
1 Claim. (Cl. 188—91)

An internal resistance brake for a vehicle, comprising a hollow casing member bounding and having formed therein at least two laterally extending parallel cylinders which are side by side and are open inwardly to the hollow interior of the casing, a piston member mounted for reciprocation within each of said cylinders, a longitudinal eccentric crank shaft journaled within the hollow interior of said casing and operatively joined to said pistons by crank shaft throws spaced radially 180 degrees such that the movement of the two said pistons are in opposite directions, rotatable spur gear and disc clutch means operatively joined in series to said crank shaft within said casing hollow interior selectively to engage and to disengage the crank shaft with rotatable drive means originating with an exterior source, a closed hydraulic conduit interconnecting said cylinders through ports formed one in the outer end of each cylinder casing, said hydraulic conduit being U shaped in elevation and extending laterally out from said casing, a pet cock opening into said hydraulic conduit intermediate said ports by means of a short branch conduit so as to leave unrestricted the internal bore of the conduit, hydraulic fluid completely filling said conduit and the space between each piston and the outer portion of the corresponding cylinder, said conduit being of a preselected restricted and constant cross sectional area to generate a preselected resistance to flow of the hydraulic fluid back and forth therethrough, and plural air cooling fins both encircling said casing about said cylinders and projecting laterally out from the outer end of each cylinder casing.

---

2,771,968

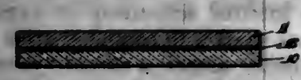


## SHOCK ABSORBER

Jean Mercier, New York, N. Y.

Original application January 30, 1948, Serial No. 5,348. Divided and this application April 5, 1952, Serial No. 280,725
Claims priority, application Luxemburg February 4, 1947
4 Claims. (Cl. 188—96)

1. A shock absorbing device comprising a cylinder containing a fluid and a piston reciprocable in said cyl-

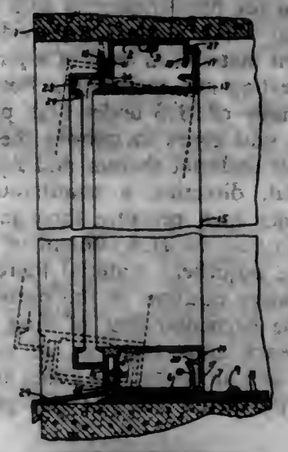


inder to subject said fluid on both of its sides to variations in pressure, said piston being provided with a rod, two chambers formed within said rod, the first of which contains fluid at substantially constant pressure and the second of which communicates with the cylinder spaces on both sides of said piston so as to provide a passage permitting fluid flow from side to side of the piston during movement thereof, a valve assembly including a valve member and a control element therefor both capable of relative movement in relation to each other and arranged

within said second chamber so as to be subjected to the variable fluid pressures in both said cylinder spaces, and means to additionally subject said control element on one side to said substantially constant fluid pressure in such a manner that said valve member is allowed to open said passage under the action of either one of said variable fluid pressures only when said control element has been displaced by the same fluid pressure either against said substantially constant fluid pressure or through the intermediary thereof.

---

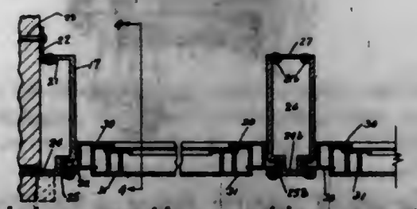
**2,771,969**
**METHOD FOR JOINING METALLIC AND CERAMIC MEMBERS**
**James M. Brownlow, Metuchen, N. J., assignor to Gulton Industries, Inc., a corporation of New Jersey**
**Application November 26, 1952, Serial No. 322,731**
**7 Claims. (Cl. 189—36.5)**



4. A joined assembly comprising a metallic member firmly physically bonded and electrically conductively joined to a ceramic member solely by a bonding layer consisting essentially of solid glass with finely divided silver dispersed therein and firmly bonded to the metallic and ceramic members.

---

**2,771,970**
**METAL WINDOWS**
**Emil K. Geyser, Pittsburgh, Pa., assignor to E. K. Geyser Company, Pittsburgh, Pa., a corporation of Pennsylvania**
**Application August 9, 1955, Serial No. 527,364**
**6 Claims. (Cl. 189—75)**

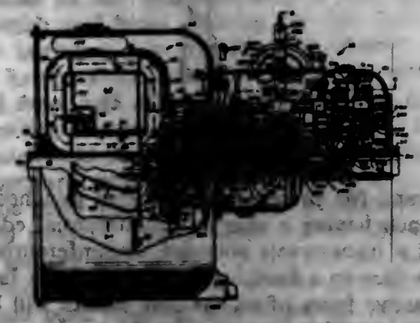


1. The combination with a wall having a window opening through it, of channels secured to the wall at the top and sides of the opening and having front and rear flanges projecting into the opening, a channel at the bottom of said opening having upwardly projecting front and rear flanges, a metal window frame in said opening surrounded by front and rear flanges overlapping the outer surfaces of the channel flanges, the front flanges of the frame and its top and bottom rear flanges being integral with the frame, and fastening members securing the rear side flanges of the frame to the rest of it, whereby before said side flanges were attached the frame was installed in said opening from the front by first placing the frame in an inclined position with its top flanges straddling the top channel and with the bottom channel disposed between

the bottom flanges of the frame and then swinging the bottom of the frame back into said opening until the frame was upright so that said rear side flanges could be secured to the frame behind the side channels.

---

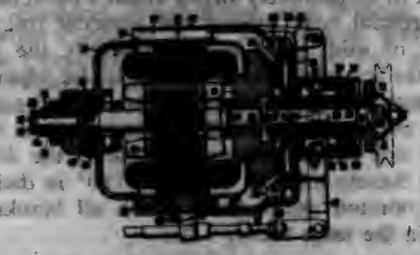
**2,771,971**
**METAL WINDOW ASSEMBLY**
**Ralph Goldberg, Denver, Colo.**
**Application October 1, 1949, Serial No. 119,171**
**2 Claims. (Cl. 189—75)**



1. A window assembly comprising, an outer metal frame having a lintel and two spaced jambs which form vertical supports for the ends of the lintel, the frame being adapted for positioning in a window opening the lintel and the jambs having channel shaped cross sections positioned with their flanges extending outwardly, the inside surfaces of the lintel and jambs having narrow grooves positioned in alignment adjacent one outer edge, a window frame positioned in the outer frame for lateral and vertical adjustment therein, the window frame having aligned flanges extending outwardly from its top and sides, positioned to enter the grooves in the lintel and jambs, the distance between the outer edges of the flanges on the sides of the window frame being less than the distance between the bottoms of the groove in the opposite jambs whereby the window frame can be adjusted laterally with respect to the jambs, the flange on the top of the window frame extending part way to the bottom of the groove in the lintel to permit the lintel to flex downwardly without placing a strain on the window frame.

---

**2,771,972**
**TORQUE CONVERTER**
**Edward J. Thurber, New Orleans, La., assignor to The Thurber Corporation, New Orleans, La., a corporation of Louisiana**
**Application July 12, 1950, Serial No. 173,341**
**25 Claims. (Cl. 192—3.2)**

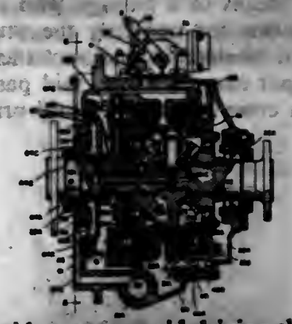


1. A hydraulic transmission mechanism comprising a rotatable driving shaft and a rotatable driven shaft, a casing containing a working fluid and also having a rotatable impeller therein connectible with said driving shaft for establishing a circulation of the working fluid in a closed path, means for connecting and disconnecting the impeller to and from the driving shaft, a pair of turbine members arranged to rotate in opposite directions, one of said turbine members being provided with a plurality of blades arranged axially thereof for receiving the fluid from the impeller and for directing said fluid axially therethrough and to the other turbine, the latter turbine being bladed to direct the fluid radially inwardly and to return the fluid

to the impeller, a pair of driven clutch members arranged adjacent each other and respectively connected with the turbine members for opposite rotation thereby, means interconnecting the turbine members to compound the torques delivered thereby and to deliver such compounded torques to both of said driven clutch members, and means for selectively connecting said clutch members to said driven shaft to establish a forward or reverse turbine drive.

---

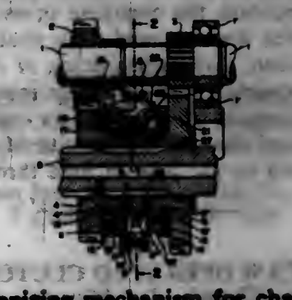
**2,771,973**
**ELECTRIC CLUTCH-BRAKE MOTORS**
**Harry B. Fage, Somerville, N. J., assignor to The Singer Manufacturing Company, Elizabeth, N. J., a corporation of New Jersey**
**Application May 1, 1952, Serial No. 285,492**
**5 Claims. (Cl. 192—18)**



1. An electric clutch-brake motor comprising a casing, a motor stator and a brake element carried by said casing, a driven shaft carried by said casing, a rotor shaft having one end journaled in said driven shaft, a driving clutch element carried by said rotor shaft, a driven disc disposed between said elements, an adjusting member threaded into said casing, a cup member slidably mounted in said casing and rotatably supporting said rotor shaft, one of said members having a notched surface and the other of said members having a ridged surface, and a yieldable connection including a spring holding said surfaces yieldingly in engagement.

---

**2,771,974**
**HYDRAULICALLY OPERATED FRICTION MEANS AND PUMP THEREFOR**
**John Daniel Mooney, St. Paul, Minn.**
**Original application May 18, 1949, Serial No. 93,945, now Patent No. 2,669,971, dated February 23, 1954. Divided and this application October 27, 1952, Serial No. 317,069**
**4 Claims. (Cl. 192—18)**

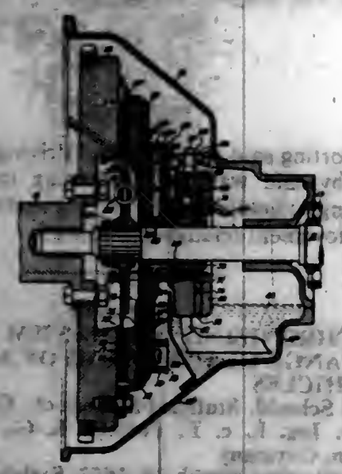


1. In a hydraulically operated transmission mechanism having a housing, a driving shaft extending through a wall thereof, a driven shaft extending from said housing and a hydraulically operated friction clutch for connecting the two shafts in driving relation, a pump for supplying fluid under pressure to said clutch, and means

for supporting said pump on said driving shaft and means carried by said wall for preventing movement of said pump longitudinally of said driving shaft while permitting lateral movement relative to said wall.

---

**2,771,975**
**SYNCHRONIZING MECHANISM FOR SPEED CHANGE GEAR SYSTEMS OF AUTOMOTIVE VEHICLES**
**Leopold Schmid, Stuttgart-Sillenbuch, Germany, assignor to Dr. Ing. h. c. F. Porsche K.-G., Stuttgart-Zuffenhausen, Germany**
**Application March 20, 1953, Serial No. 343,650**
**Claims priority, application Germany March 25, 1952**
**16 Claims. (Cl. 192—48)**



1. A synchronizing mechanism for change speed gear systems, comprising a shaft, a clutch member having clutch teeth and mounted for rotation on said shaft, a compressible split spring ring carried on a side face of the clutch member, means for holding the ring against appreciable relative rotation with respect to the clutch member, a slidable member mounted on and rotatable with said shaft, said slidable member being mounted adjacent to the ring and having internal clutch teeth, said slidable member being arranged to be shifted to engage its clutch teeth with the peripheral surface of said split spring ring for effecting synchronization and then to engage its clutch teeth with the clutch teeth of the clutch member, and means for holding said split spring ring in a compressed prestressed condition on the clutch member when not engaged by the clutch teeth of the shiftable member, whereby a soft gear change is effected and the shift path is considerably shortened.

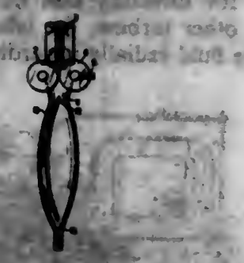
---

**2,771,976**
**SPEED RESPONSIVE FLUID CLUTCH**
**Richard L. Smirl, La Grange Park, Ill., assignor to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois**
**Continuation of abandoned application Serial No. 79,883, March 5, 1949. This application March 16, 1955, Serial No. 493,440**
**1 Claim. (Cl. 192—85)**

In power transmission mechanism, a drive shaft, a driven shaft and a friction engaging means for establishing drive therebetween, a fluid pressure operated mechanism for effecting engagement of said friction means,

and an automatic fluid pressure control system for graduating engagement of said friction means comprising a drive shaft driven pump having its outlet hydraulically connected by means of a passage with said pressure operated mechanism for applying the pump outlet pressure to the said mechanism and an orifice through which the pump output can discharge, said passage being relatively large in cross section and said orifice being small

in cross section with respect to the passage thereby to build up fluid pressure in said pressure operated mechanism and to increase the engaging pressure of said friction means as the speed of said drive shaft increases from a starting position, said orifice being of a fixed type and gradually decreasing in area from its inlet end to its outlet end and having sharp edges on its outlet end to minimize the effect of changes in viscosity of the fluid on the pressure built up by the flow of fluid through it.



---

**2,771,977**
**CAM OPERATED CLUTCH**
Edmond Uher, Chemin des Mougins, Cap d'Antibes, Alpes Maritimes, France, assignor to Uher Engineering Company, Panama, Panama, a company of Panama
Application October 16, 1952, Serial No. 315,029
Claims priority, application Germany February 9, 1952
3 Claims. (Cl. 192—93)

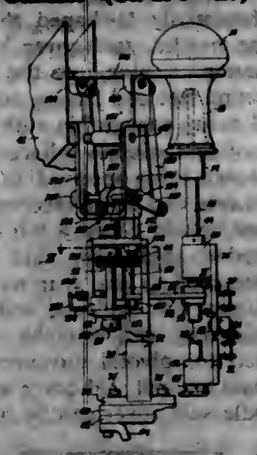
3. A cone friction coupling between a fly-wheel and a shaft coaxial therewith comprising, in combination, bearing means to journal said fly-wheel on said shaft, a friction conical member rigid with said fly-wheel, a hub on said shaft, an annular disc having a conical rim adapted to be frictionally engaged on said friction cone, an elastic system, including a spider having its outer periphery secured to said annular disc and its inner periphery secured to said hub, to continuously urge said annular disc toward said fly-wheel to thereby clutch said rim with said friction cone and means to oeclutch said rim from said cone against the action of said elastic system.

**2,771,978**
**DEVICE FOR ORIENTING AND FEEDING DISK-LIKE MEMBERS**
Julius Neuhaus and Friedrich Wilhelm Neuhaus, Koln-Kalk, Germany
Application May 12, 1952, Serial No. 287,392
2 Claims. (Cl. 193—43)

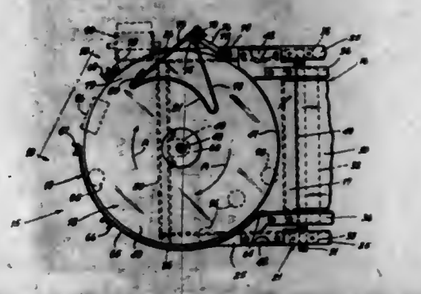
1. Means for presenting successive punched out disk blanks each having a sharp circumferential edge on one face and a transversely rounded circumferential edge on the other face to a finishing machine in such fashion that the respective faces of all the disk blanks will be located in the same position for action by the machine, said means including a pair of hard faced cylindrical and oppositely rotatable feed rolls, said feed rolls being mounted on parallel, horizontal axes, means resiliently urging said rolls toward each other to form a bight, means for delivering successive blanks to the bight between said feed rolls, means driving said feed rolls, a pair of vertically extending guide chutes having a common inlet disposed beneath and immediately adjacent said feed rolls and a common outlet, said inlet being of substantial cross-sectional area, separator means in said inlet located beneath, parallel to and intermediate the axes of said rolls, one of said rolls engaging each successive disk blank at its sharp circumferential edge and the other roll engaging the disk blank at the inner terminal of said curved edge and inwardly of its circumferential edge upon final passage of the disk blank from between the rolls thereby causing the blank to be positively swung about a point on its sharp circumferential edge toward the adjacent roll for entry into one of said guide chutes, whereby the successive disk blanks are positively delivered to the separate guide chutes in accordance with the relation of the sharp and rounded edges thereof to the separate feed rolls, and means in one of said chutes for rotating the disk blanks delivered thereto through angles of 180° in their passage to said common outlet from which all blanks are discharged in the same order.

---

**2,771,979**
**VENDING MACHINES**
Charles A. Lambert, New City, N. Y.
Application October 6, 1953, Serial No. 384,465
5 Claims. (Cl. 194—39)



1. A vending machine comprising a substantially cylindrical upright housing having a front portion and a rear portion, said front portion having a concentric arcuate slot therein positioned between the top and bottom of the housing, an arcuate guide rail concentric with and mounted on the inside of the housing below said slot, an arcuate band concentric with and slidably mounted on said rail behind said slot and adapted to be slid alternately in opposite circumferential directions, a magazine mounted in the front portion of the housing below said slot and having a plurality of circumferentially spaced vertical compartments adapted to contain stacks of uniformly-sized articles to be dispensed by the machine, said band having a frame supported thereon and having an opening therethrough of approximately the same height and width as one of said articles, a horizontal slide slidably supported in said frame on the same diameter of said housing as that on which said band opening lies, the outer end of said slide having a grip therein, said opening through said band having a sill, a receiver extending outward and downward from said sill adapted to receive a purchased article, resilient means normally urging said slide outward through said band opening, limit stop means limiting the outward movement of said slide to a position wherein the outer end of the slide is positioned over and covers said receiver, means supported on said frame for normally locking said slide in innermost position of the slide wherein the forward end of the slide lies substantially in said band opening, and means for releasing said locking means, said slide having the forward portion thereof rearward of said grip raised above and parallel with the rearward portion thereof thereby providing a wall between said portions of the slide, the length of said raised portion of the slide being approximately equal to the length of one of said articles, means normally urging said stacks of articles upward, said magazine having limit stops at the top of said compartments limiting the top of the stack to the horizontal level of said slide wall whence the topmost article of the stack is engageable by said slide wall upon outward movement of said slide, said slide being adapted to be pushed back manually to said innermost position.



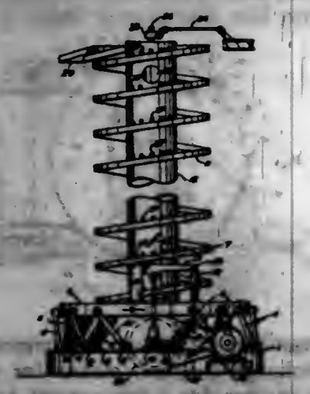
---

**2,771,980**
**BULB UNLOADING DEVICE FOR A CONTINUOUS CONVEYOR TYPE MACHINE**
Ralph R. Pavlecci, Wood-Ridge, and William A. Brunnock, West Caldwell, N. J., assignors to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application March 31, 1955, Serial No. 498,364
4 Claims. (Cl. 198—27)

2. A bulb unloading device for a continuous conveyor type machine comprising a body having an upstanding plate provided with a lower mounting flange and a pair of generally horizontally spaced shaft mounting flanges, a rail frame rotatable in said flanges, a rail frame rotating mechanism on said body for engagement with a continuously moving head of said machine and for horizontally rotating said rail frame about a vertical axis, a pair of bulb receiving guide rails pivoted on said rail frame and a rail lifting mechanism on said body for simultaneously rotating said rails about a horizontal axis during the horizontal rotation of said rail frame.

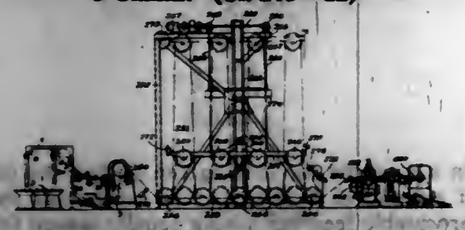
**2,771,981**
**UNSCRAMBLER CONSTRUCTION**
Duane R. McKune, Dunedin, Fla., assignor, by mesne assignments, to Brogdex Company, Orange County, Fla., a corporation of Florida
Application March 19, 1951, Serial No. 216,386
11 Claims. (Cl. 198—30)

1. An unscrambler construction comprising, in combination, a discharge channel, means for receiving cans or the like in masses for advancement toward the discharge channel, means for advancing the cans to the vicinity of the discharge channel, means for aligning at least a portion of the cans in single file during said advancement, means for releasing ahead of said discharge channel any cans fed to said unscrambler construction in overturned positions, means for deflecting any remaining cans from the vicinity of the discharge channel for readvancement to the vicinity thereof, and means for preventing overturning of cans or the like during unscrambling.



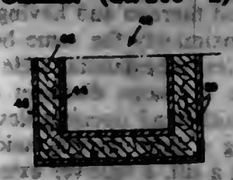
---

**2,771,982**
**CAN BODY RESPACING MECHANISM**
Lloyd H. Weber, Newark, N. J., assignor to American Can Company, New York, N. Y., a corporation of New Jersey
Application July 29, 1953, Serial No. 370,978
7 Claims. (Cl. 198—34)



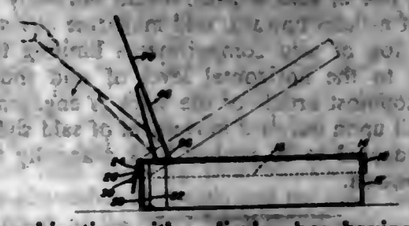
7. In a machine for making can bodies, the combination of a mandrel, a delivery feed mechanism including a reciprocatable feed bar having equally spaced feed dogs extending along said mandrel, means for reciprocating said feed bar through a feeding stroke and a return stroke for propelling can bodies along said mandrel in spaced and timed processional order and for delivering the bodies to a transfer station, an outside horse disposed in overlapping relation to said mandrel, a continuously operating receiving feed mechanism disposed adjacent said outside horse and including a conveyor having spaced gripper dogs for gripping said can bodies at said transfer station for further advancement, means disposed adjacent said transfer station for engaging can bodies individually on said mandrel for increasing the space between adjacent can bodies to facilitate entrance of said gripper dogs into said respaced bodies for advancement along said outside horse, and an auxiliary feed dog on said feed bar adjacent its terminal end spaced from a preceding feed dog a greater distance than the distance between said equally spaced feed dogs.

2,771,983
SPIRAL CONVEYOR
Robert M. Carrier, Jr., Louisville, Ky., assignor to Carrier Conveyor Corporation, Louisville, Ky., a corporation of Kentucky
Application April 29, 1952, Serial No. 285,019
12 Claims. (Cl. 198—220)



1. In combination, a conveyor having a helical conveying surface, means for resiliently supporting and guiding said conveyor for vibration along a generally helical path to convey material on said surface longitudinally thereof, and impulse generating means adapted to vibrate said conveyor, said impulse generating means comprising a pair of upstanding members on said conveyor, a generally horizontal arm pivotally connected to said members, and a generally vertically reciprocating rod pivotally connected to said arm between said members, one of said members being extensible to allow said conveyor to settle on its resilient support according to the load of material thereon and constituting a substantially rigid link during vibration of said conveyor so that the latter will be vibrated at a substantially uniform amplitude corresponding with the stroke of said reciprocating rod.

2,771,984
MECHANISM FOR HANDLING ELONGATED MATERIAL
Neil J. Ramsey, Mentor Township, Lake County, Ohio, assignor to Wean Equipment Corporation, Euclid, Ohio, a corporation of Ohio
Application May 16, 1951, Serial No. 226,702
3 Claims. (Cl. 283—12)

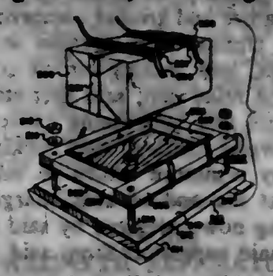


1. Mechanism for handling elongated material comprising an operating station, means pulling elongated material from the operating station, take-up means between the operating station and the pulling means, the take-up means including portions normally biased to move relatively away from each other for engaging and taking up slack in the material, one of the portions of the take-up means having mounted thereon a projecting contact member, a device positioned to be engaged by said projecting contact member upon relative approach of said portions toward each other and only when said portions are almost in their closest together relationship, means progressively operated by such device during continued relative approach of said portions toward each other and connections between said device and the pulling means progressively slowing up the pulling means upon progressive operation of said device by said projecting contact member.

2,771,985
CORROSION RESISTANT STRUCTURE
Raymond B. Seymour, Emmaus, Pa., assignor to The Alles Mineral Products Company of Pennsylvania, Morristown, Pa., a corporation of Pennsylvania
Application May 9, 1955, Serial No. 506,869
4 Claims. (Cl. 206—2)

1. A structure adapted to contain corrosive fluids comprising an inner synthetic resin wall having a thickness of from about 5 to about 100 mils, an outer synthetic resin wall having a thickness of from about 5 to about 100 mils and spaced from said inner wall a distance of from about ⅛" to about 2.5" and sulfur between said inner and outer walls.

2,771,986
FOLDING DISPLAY PAPERBOARD BOX OR COVER
Irving Bakoff, Brooklyn, N. Y.
Application May 10, 1954, Serial No. 428,741
1 Claim. (Cl. 206—45.3)



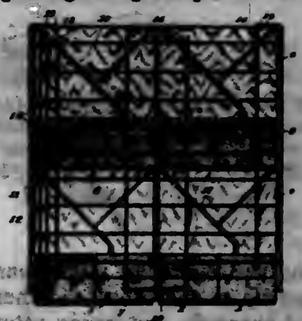
In combination with a display box having a rear wall, a display cover hingedly secured to said box, said cover having a substantially U-shapel slit therein forming a window, a transparent pane underlying said window, a central tab having a first end hingedly attached to said cover and having a second free end, said central tab having a second substantially U-shaped slit therein, said central tab being folded upon itself with said second free end lockingly held adjacent said first hinged end and with said second substantially U-shaped slit forming an upwardly extending handle, said cover having an opposed pair of slots therein opening into the periphery of said window, said second free end having notches therein, said second free end being engageable with said cover at the peripheral edge of said window adjacent said first hinged end with said cover being received in said notches and with said second free end being received in said slots, an end wall attached to said cover, a tab cut from said end wall and attached to said cover, said tab having a slot therein, a flap attached to said rear wall, said flap being engaged in said slot with said end wall within said box and engaging said rear wall whereby said cover will be hingedly mounted for pivotal movement on an axis at the juncture of said tab and said cover so that upon actuation of said handle said cover can be opened.

2,771,987
PACKAGING FOR ELECTRONIC EQUIPMENT OR THE LIKE
Benedict T. Kennedy, Long Beach, Calif., assignor to Hoffman Electronics Corporation, a corporation of California
Application January 14, 1955, Serial No. 481,750
2 Claims. (Cl. 206—46)

1. In a shipping carton, in combination, an item of electronic equipment, cushioning material wrapped about said electronic equipment, a sealed moisture- and vapor-proof protective cover enclosing said wrapped electronic

equipment, a base pallet having an upper rectangular indentation area, an angularly disposed cushioning material positioned along the lower indentation edges of said base pallet, means for securing said wrapped and sealed electronic equipment to said base pallet in position on said cushioning material, a rectangular base element,

attachment means for affixing said pallet-secured electronic equipment to said rectangular base element, said means being exteriorly disposed with respect to said wrapped and sealed electronic equipment, and a crate affixed to said rectangular base element for enclosing said wrapped electronic equipment.



2,771,988
DISPENSING CIGARETTE CARTON
Harter E. Sweeney, Lafayette, Ind.
Application May 2, 1955, Serial No. 505,451
1 Claim. (Cl. 206—56)

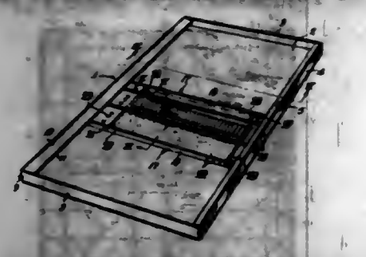
A cigarette carton having two adjacent series of packages of cigarettes disposed therewithin comprising an enclosed container provided with top, bottom, front and back sides and with ends, a punch-out portion formed in one of said sides adjacent one of said ends, said portion being defined by perforations and removable to leave an opening for cigarette pack ejection, a second punch-out portion formed in the side opposite to that in which said first portion is formed and in alignment with said first portion, said second portion being defined by perforations and removable to leave an opening for the reception of means to eject a package through said first opening, and a third punch-out portion defining a slot in a side of said carton at a predetermined location in relation to two adjacent packages nearest an end of said carton, said last mentioned portion being defined by perforations, said second portion being sized to be inserted partially through said slot for abutment with the bottom of said two adjacent packages of cigarettes.

2,771,989
DIVIDED PALLET BRICK PACKAGE
William E. White, Bethlehem, Pa., and John R. Clark, Silver Spring, Md., assignors, by mesne assignments, to John R. Clark and Thomas Somerville III, Kenwood, Md., trustees
Application June 25, 1954, Serial No. 439,338
1 Claim. (Cl. 206—65)

A divisible package of bricks or the like, comprising a group of like rectangular sub-packages of bricks, each sub-package having a pallet formed from a single sheet of welded metal wire fabric having spaced leg portions defining therebetween channels for a lifting fork, at least two sub-packages being placed together end to end with the channels in horizontal alignment, a second group of at least two packages superimposed on the first group

with their channels in horizontal alignment and parallel to the channels of the first group, each sub-package of bricks having a removable cover maintaining the separate integrity of each sub-package, and an enclosure comprised of separate reticular metal wire panels depending and supported from the top of the assembled package and holding it snugly together.

2,771,990
BOX FOR THE STORAGE OF SEWING NEEDLES
Gustav Buschhüsgen, Iserlohn, Westphalia, Germany
Application August 25, 1953, Serial No. 376,443
2 Claims. (Cl. 206—66)



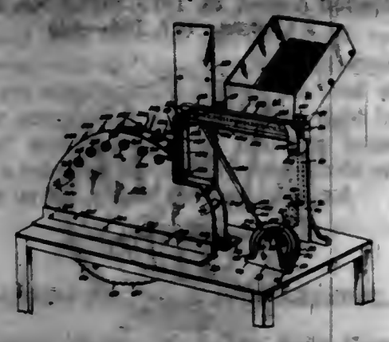
1. In a box for the storage of sewing needles, said box including a circular bottom, a circular cap-shaped needle carrier located upon said bottom and being provided at the upper face with a plurality of undulations forming needle holding compartments which freely extend to the periphery of said carrier, a circular cover of a transparent material rotatably supported upon said bottom and having a circumferential portion to close the free ends of said needle holding compartments, in combination, a helical spring connecting said cover and said bottom to permit rotation of said cover, and a leaf spring connected with one end of said helical spring so as to automatically return said cover in its closure position, said circumferential portion of said cover being provided with a hole allowing the needle to be inserted into and removed from said compartments; said circumferential portion having a widened part, said leaf spring having an angularly bent end and being arranged mainly in said widened portion of said circumferential portion so that said angularly bent end of said leaf spring enters grooves of said circumferential portion whenever said cover is rotated at an angle bringing said hole into alignment with one of said needle holding compartments.

2,771,991
DISPLAY TRAYS
Delbert A. Eisele, Lawrence, Kans.
Application December 12, 1955, Serial No. 552,496
6 Claims. (Cl. 206—75)

1. A wrist watch band display tray comprising in combination a substantially open rectangular tray, long nar-

row display channels nesting removably in said tray and extending lengthwise thereof, each of said channels having near each end thereof a wrist watch band spring-bar, one of said spring-bars being adjustable lengthwise of said channel; said tray having a fixed lip along one edge

thereof overlying and clamping said channels; said tray having a pivoted lip at the other end thereof overlying and holding said channels, and spring actuated means to force said pivoted lip into overlying holding position relative to said channels.



---

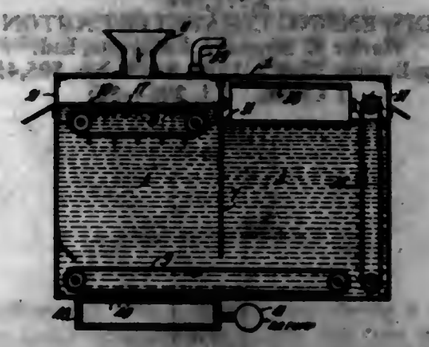
2,771,992

## CAPACITOR TESTING APPARATUS

Thomas William Artingstall, Altadena, and Erich F. Feigl, Los Angeles, Calif., assignors to Solar Manufacturing Corporation, Los Angeles, Calif., a corporation of New York

Application April 26, 1951, Serial No. 223,102
14 Claims. (Cl. 209—81)

1. Apparatus for testing the capacitance of disc capacitors comprising a capacitor feeding mechanism, an electrical circuit for testing the capacitance of said capacitors and an electromagnetic circuit for ejecting said capacitors from said feeding mechanism at the end of the capacitance test, said electrical circuit comprising an oscillator circuit, a limiter circuit, a band pass filter, a Wheatstone bridge, and a trigger circuit, the output of said trigger circuit being connected to said electromagnetic circuit; said feeding mechanism moving said capacitors in contact with said testing circuit one at a time; said oscillator generating a signal of predetermined frequency for the correct capacitance of said capacitors, said signal being applied to an arm of said Wheatstone bridge through said limiter and band pass circuit; said Wheatstone bridge comprising two diodes and resistors in series, said signal unbalancing said bridge and producing a negative signal across one of said resistors; said resistor being the input of said trigger circuit; said trigger circuit comprising two direct coupled multi-element electron tubes, the first of said tubes being normally conductive, the second of said tubes being normally cut off, said negative pulse cutting off said first tube and applying a positive pulse to the control grid of said second tube, and making said second tube conductive, said electromagnetic circuit being connected to the output of second of said tubes and comprising a relay, a solenoid, said relay having a coil, two stationary contacts and an armature, the plate of the second of said tubes being connected to one of said stationary contacts and to one side of said relay coil; a power supply; the other side of said relay coil being connected to said power supply; means biasing said armature to the second of said stationary contacts; a timing capacitor; said timing capacitor being connected between said armature and ground; said solenoid coil being connected between said second stationary contact and ground, a discharging path between said armature and ground comprising high resistances; a locking circuit being formed at triggering of said trigger circuit, said locking circuit comprising said power supply, said relay coil, said first stationary relay, said relay armature and said timing capacitor, said timing capacitor charging through said locking circuit and making said relay armature return to said second stationary contact at the end of said charging operation; said solenoid being now energized by said timing capacitor and ejecting said capacitors from said feeding mechanism.



---

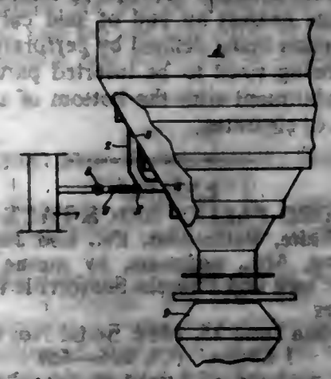
2,771,993

## SEPARATING EQUIPMENT

Karl B. Wendt, Fayetteville, N. Y.

Original application October 19, 1949, Serial No. 55,319. Divided and this application August 28, 1952, Serial No. 306,843
5 Claims. (Cl. 209—172)

1. A method for the separation of materials in accordance with specific gravity from a mixture of materials having different specific gravities comprising the steps of inserting said mixture of materials into a liquid, decreasing the specific gravity of the liquid by maintaining a quantity of air bubbles throughout said liquid to form a foam-like mixture of air and said liquid, separately removing that portion of the material which floats in the liquid before and after decreasing the specific gravity of the liquid, and separately removing that portion of the material which sinks in the liquid at its greatest specific gravity.



---

2,771,994

## APPARATUS FOR SEPARATING MATERIALS OF DIFFERENT SPECIFIC GRAVITIES

William P. Connelly, Philadelphia, Pa., assignor to United Engineers & Constructors Inc., Philadelphia, Pa., a corporation of Pennsylvania

Application November 13, 1952, Serial No. 320,265
4 Claims. (Cl. 209—172.5)

1. In separating apparatus of the type set forth, the combination with a separating vessel containing a fluid separating medium or predeterminable specific gravity, of means for introducing work materials into said fluid medium, means for discharging lower specific gravity components of the work material from the upper area of the vessel, means for discharging components of the work material of relatively high specific gravity from the lower area of the vessel, and means for withdrawing from the body of the fluid mass in the vessel the components of the work material of intermediate specific gravities accumulating in an area between said discharge areas and for forcibly transferring the components so withdrawn to another area in closer proximity to one of said discharge areas.

---

2,771,995

## MAGNETIC SEPARATOR

Jacques F. Noel, Fontainebleau, France, assignor to Société Jonas A. G. Chur, Zurich, Switzerland, a Swiss company

Application November 27, 1953, Serial No. 394,836
Claims priority, application France November 27, 1952
3 Claims. (Cl. 210—1.5)

1. Apparatus for magnetically separating and recovering magnetic particles from a liquid containing magnetic particles comprising a rigid tray-like separating member having a separating surface inclined to the horizontal and in the form of a surface of revolution generated by the rotation of a line about an axis of revolution; stationary magnetic means mounted on one side of said separating surface and positioned so that the magnetic field will cover a wide sector area of said separating surface; means including a stationary launder positioned to direct a continuous trickling of the liquid being treated in a downward direction generally radial to the axis of rotation of said surface and engaging a portion of the sector of the separating surface covered by said magnetic field on the side of the separating surface opposite said magnetic means, the remaining portion of said sector forming a draining zone; scraping means engaging a sector of said surface circumferentially spaced on the direction of rotation from said magnetic field for removing the collected magnetic particles therefrom; and means for rotating said surface about an axis extending upwardly from the horizontal whereby the magnetic particles attracted to the separating surface will be laterally separated from the trickling liquid thereon, moved through said draining zone and finally removed from the separating surface by the scraping means.

---

2,771,996

## METHOD OF ACCELERATING THE SPEED OF SEDIMENTATION OF PARTICLES WITH DISPERSED CAROB BEAN FLOUR

Georges Hulot, Paris, France, assignor to Société d'Etudes Chimiques pour l'Industrie et l'Agriculture, Paris, France

No Drawing. Application September 21, 1951, Serial No. 247,145
Claims priority, application France September 23, 1950
3 Claims. (Cl. 210—54)

1. A method of accelerating the speed of sedimentation of solid inorganic particles suspended in aqueous solutions of electrolytes which comprises adding to said solutions as collector agent a colloidal carob bean flour solution prepared by distributing carob bean flour in water and heating the same with a solution of boric acid at a temperature of 70° to 130° C. to effectuate sedimentation of said suspended inorganic particles and separating the thus sedimented particles from the solutions.

---

2,771,997

## APPARATUS FOR SEPARATING WATER, OIL, SLUDGES, WAXES, AND THE LIKE

George Redfearn Usherwood, London, England, assignor of one-half to Henry Arthur John Silley, London, England

Application June 23, 1952, Serial No. 294,693
Claims priority, application Great Britain July 6, 1951
5 Claims. (Cl. 210—60)

1. Apparatus for effecting initial separation of wastes and sludges from oil-contaminated water, comprising a chamber having a floor, end walls and side walls, a weir plate extending vertically upwardly from the floor across the chamber between the side walls and adjacent one end wall of said chamber, an inlet conduit opening into said chamber through the said one end wall at a point above said floor and below the upper edge of said weir plate, said conduit directing a concentrated stream of contaminated liquid horizontally against said vertical weir plate to produce an abrupt change in direction of flow of said liquid in said chamber, a baffle plate extending downwardly across the chamber between the side walls thereof and on the opposite side of said weir plate from said inlet conduit, said baffle plate having its lower edge arranged at a level below the level of the upper edge of said weir plate, and a horizontal baffle plate extending between said one end wall and said weir plate above said inlet conduit but below the edge of said weir plate and having its side edges spaced from said side walls.

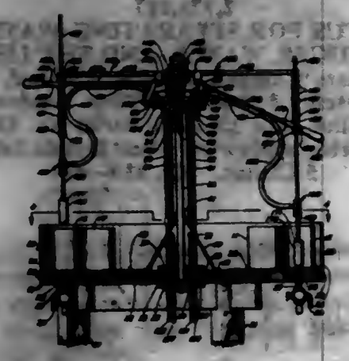
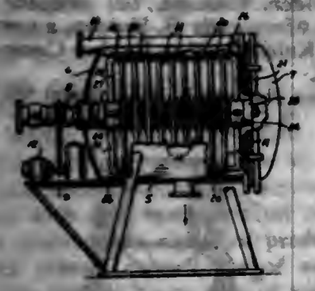
2,771,998

## AERATOR SCREEN



Orloff W. Holden, Chicago, Ill., assignor to Orloff W. Holden and Marguerite H. Holden, a partnership doing business as Kaleidoscope Rubber Company, Not Inc., Chicago, Ill.

Application January 5, 1954, Serial No. 402,237
3 Claims. (Cl. 210—84)



1. In a unit through which a liquid stream flows, a filtering and diffusing device for the stream adapted to be mounted within the unit including in combination, at least two diffuser screens, means for supporting said screens in the unit with said screens overlying one another and each said screen having a body portion extending across the unit, and at least one of said screens having an integral inwardly bent-over outer portion interlocking adjacent screens, said bent-over portion forming a raised spacer on said one of said screens thereby serving to separate the body portions of said adjacent screens one from the other and resulting in a relatively smooth peripheral edge free of wire endings.

2,771,999
**FILTERING APPARATUS**
Robert Q. Boyer, Berkeley, Calif., assignor to the United States of America as represented by the United States Atomic Energy Commission
Application January 5, 1945, Serial No. 571,422
13 Claims. (Cl. 210—113)

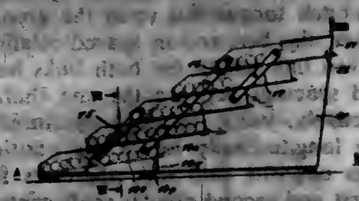
1. Filtering apparatus comprising in combination, a tank, a filter element adapted to be moved into and out of said tank, a stationary column spaced from said tank, a stationary coupling means mounted upon said column, a first conduit attached to one end of said coupling means, a second conduit attached at one end to the filter element, a framework mounted upon said column, an adjustable filter manipulating member mounted upon said framework for movement in a plane including said tank and said coupling means and comprising a support for said filter and said second conduit, and an abutment mounted upon the manipulating member having the second end of the second conduit attached to the abutment and adapted in one position to make fluid-tight contact with the coupling means and in a second position to break contact therewith.

2,772,089
**LEAF ANCHORING MEANS**
Charles E. Hunsaker, Ridgewood, N. J.
Application March 30, 1953, Serial No. 345,298
2 Claims. (Cl. 210—153)

1. In filtering apparatus having a filter pack adapted to be mounted on a shaft and provided with spaced discal leaves defining open channels therebetween and each leaf having outer marginal lateral flanges extending thereabout, the improvement which comprises a plurality of spacers disposed in circumjacent relation about the leaves and in axially extending rows with the spacers of each row interposed between confronting flanges of adjacent leaves in longitudinally staggered relation, and bolts detachably fixing each of said spacers to the adjacent respective leaves, each of said bolts extending through the flanges of only two leaves and the spacer therebetween, whereby the spatiality of said leaves in said pack is maintained while permitting any one of said leaves to be removed from said pack without disassembling entirely the remaining leaves of said pack.

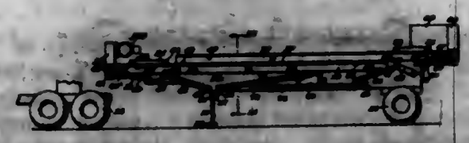
2,772,091
**FILTER FOR FLUIDS SUCH AS GASOLINE**
Roy L. Bowers, Flint, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application November 16, 1953, Serial No. 392,337
1 Claim. (Cl. 210—169)

In a filter, the combination of a receptacle comprising a top portion and a bowl portion held together under pressure to form an exterior seal between them, inlet and outlet passages in said top portion and communicating with said bowl portion, said inlet conduit leading centrally and downwardly into said bowl portion, two filter elements surrounding said inlet conduit and mounted within said receptacle to operate in series in a flow path leading from said inlet conduit into said bowl portion and to said outlet passage, one of said elements comprising a stack of flat annular filtering rings coaxially mounted on a support plate having perforations, the said stack having an annular series of vertical passages blocked at their lower ends and communicating at their upper ends with said perforations the other of said elements being in the form of a disc of yieldable filter material having a central aperture, the margins of said support plate and said disc within said exterior seal being clamped by said pressure into sealing relation with said top portion to determine said flow path, and the arrangement being such that fluid impurities emanating from said inlet conduit are brought into contact with the interior and exterior surfaces of said one of said elements for retention in said bowl portion.

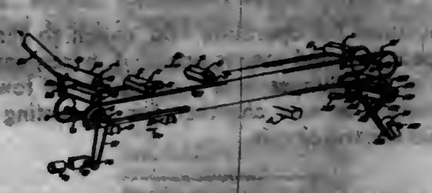


2,772,092
**PERFORATED PLATE-TYPE STRAINER**
Bernard A. Munro, Brooklyn, N. Y., assignor of one-half to Marilyn Solomon, Brooklyn, N. Y.
Application September 14, 1953, Serial No. 380,030
2 Claims. (Cl. 210—169)

1. A water purifying filter comprising an externally threaded tubular casing open at each end, cap means having internal threads secured to said tubular casing to close said ends, an internal annular shoulder spaced from said internal threads in said cap means and strainer means between the internal threads and shoulder to filter minute particles in the water, said strainer means comprises an outer ring, a disc retained in said ring, tapered perforations in the walls of the disc, and a plurality of discrete burrs along the interior walls of the tapered portion.



2,772,093
**DISPLAY CABINET**
Richard R. Volz, Ridgewood, N. J., assignor, by mesne assignments, to Curtis & Clark Inc., Wilmington, Del., a corporation of Delaware
Application October 28, 1952, Serial No. 317,269
4 Claims. (Cl. 211—130)

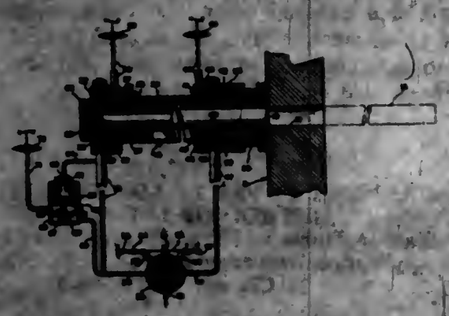


1. A self-service display cabinet for cylindrically-shaped articles comprising a stack of trays of uniform length and width, one tray being superimposed upon another; means for enabling all the trays above the bottom one to swing backwardly to an offset extended position in which the trays are upwardly inclined from front to back and present a stepped arrangement, each tray overlapping at least the rearward half of the tray immediately beneath it, said means also enabling the trays to swing forwardly from their extended position to a stacked or collapsed position; each tray having an open top through which the articles are visible and accessible and also having an open back side through which fresh articles may be added, the articles being movable downwardly in the trays by means of gravity; a pair of rearwardly extending end panels for supporting the cabinet when said trays are in their extended position, each end panel having a stepped upper edge with the steps increasing in height from the front to the back of the panel, the steps of one end panel corresponding to those of the other to form pairs of steps, each pair of steps being adapted to support thereon a tray of the cabinet when the trays are extended.

2,772,094
**PORTABLE GANTRY CRANE**
Jack D. Noble, Lafayette, Calif.
Application May 29, 1952, Serial No. 290,647
6 Claims. (Cl. 212—71)

1. A portable and collapsible gantry crane, comprising an elongated, horizontally-disposed bridge beam having a pair of spaced-apart parallel girders joined together at their ends; a pair of positioning guide members pivoted to said bridge beam, one adjacent each end, each said guide member having a pair a parallel side plates lying adjacent the exterior side faces of said beam, a pair of coaxial horizontally-disposed pinions, one journaled on the outside of each side plate, and a pair of horizontally-disposed coaxial rollers, one journaled on the outside of each said side plate, said rollers being spaced apart from said pinions and generally collinear therewith; a pair of supporting columns, each comprising a pair of parallel side girders with their interior facing surfaces spaced apart wider than the exterior surfaces of the side girders of said beam, so as to be nestable therearound and braced by end girders at each end, each said column side girder having racks on one surface engaged by said pinions, its other side being engaged by said rollers; releasable means for securing said guide members rigidly to its associated column; and other releasable means for rigidly securing said guide members to the ends of said beam; means for rotating said guide members about said beam when said guide member is rigidly secured to its associated column for erecting said columns so that they are parallel to each other at each end of said beam and for lowering said columns, one over the other to nest around said beam and parallel to it; and means for moving said guide members along said columns when said columns are erected and said guide member is rigidly secured to said beam instead of to said column, so as to raise and lower said beam between said erected columns.

2,772,095
**CANNERY COVER LOADING DEVICE AND METHOD OF USING SAME**
William D. Dubin and Fred Wrahme, Long Beach, Calif.
Application December 6, 1954, Serial No. 473,116
16 Claims. (Cl. 214—16)



1. A device for use in automatically distributing covers from a particular location to a plurality of open-mouthed magazines associated with individual cover applying machines, including: driven belt means located adjacent to and above said magazines; means that continuously supply said covers; loading means adapted to receive said covers, which loading means is positioned above said belt means; means for limiting the quantity of said covers to a predetermined charge thereof; actuating means for said loading means to cause discharge thereby of said cover charge; a plurality of cartridges mounted in spaced relationship on said belt means, each of which cartridges is adapted to removably hold said cover charge; movably mounted loading means adapted to receive one of said charges when in a first position and to transfer same into one of said magazines; means associated with each of said magazines, which means is sensitive to the quantity of said covers contained in said magazines; means that maintain each of said movably mounted means in said second position until said quantity sensitive means signals that a particular one of said magazines requires another one of said charges; means that return said movably mounted means to said first position after said maintaining means receives said signal; means that cause a cartridge to receive one of said charges as it passes under said loading means; means mounted on said cartridges that causes one of said cartridges when empty to actuate said loading means when said empty cartridge passes thereunder; and means for blocking movement of said covers from said supply means to said loading means during the time one of said charges is being transferred from said loading means to one of said cartridges.

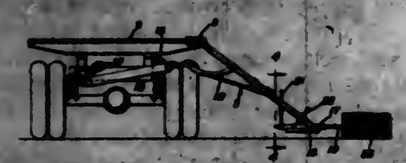
2,772,096
**CUPOLA STOCK LINE INDICATOR**
Leo A. Glenet, Port Washington, Wis., assignor to Modern Equipment Company, Port Washington, Wis., a corporation of Wisconsin
Application March 11, 1953, Serial No. 341,670
11 Claims. (Cl. 214—18.2)

1. In a cupola having a stock chamber, means including a skip carriage for introducing a charge into said chamber, an electric motor for driving said means, a stock height determining member mounted on said cupola and including a double acting fluid pressure operated ram having a plunger movable from normally retracted position to a projected position within said chamber, a source of fluid under pressure for said ram, a fluid circuit connected between said source and ram, a valve controlling the di-

ruption of the flow of fluid to said ram, means responsive to movement of the plunger to projected position for reversing said valve to cause retraction of the plunger, an electric circuit for said motor, a switch in said circuit, means responsive to return movement of the piston to re-

tracted position for operating said switch to render said circuit operative, and means operated in response to obstruction of the plunger as it is being moved toward projected position in said chamber for preventing completion of said electric circuit.

---



2,772,007

**VEHICLE MOUNTED BALE LOADER**

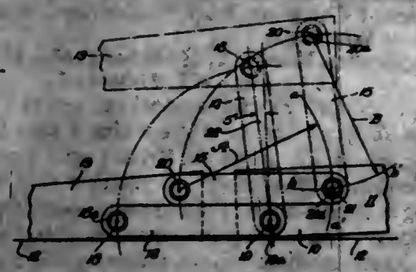
Reuben F. Johnson, Kensington, Minn.

Application June 28, 1954, Serial No. 439,597

6 Claims. (Cl. 214—86)

1. A bale loader comprising a vehicle attached vertically swingable member and adapted for raising from an outwardly projecting position at one side of the vehicle into a substantially perpendicular position, a shaft having a fork at one end with the tines thereof extending at right angles to the shaft, means rotatably and swingably attaching the shaft to the outer end of said member for vertical swinging movement independently of the latter, and means carried by the shaft and engaging a relatively stationary structure when the member is in a lowered position for holding the shaft from rotation with the fork in a forwardly facing bale penetrating position, and said last named means being disengaged from said structure upon a predetermined raising movement of the member to release the shaft for turning movement by the weight of the load on the tines to face the fork downwardly for depositing the load.

---



2,772,008

**METHOD OF SPOTTING PIVOTAL CENTERS FOR SWINGING LINK STRUCTURE OF FOLDING GOOSENECK TRAILER HITCH**

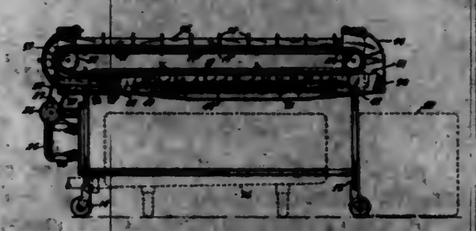
William E. Martin, Kewanee, Ill.

Application June 27, 1952, Serial No. 295,972

4 Claims. (Cl. 214—152)

1. In a folding gooseneck type trailer having a vertically movable hitch tongue joined with the trailer bed through pairs of swingable links with apertured ends pivotally carried upon shafts supported upon said tongue and bed respectively, the method of spotting the four pivotal centers for the pivot shafts for said pairs of links to establish predetermined raised and lowered positions for said hitch tongue with respect to said bed which consists of placing the head end of the bed upon the ground, disposing the hitch tongue flat upon the ground beyond the head end of the bed and in spaced relation thereto, selecting a given link length for both links having equal predetermined spacings between the end shaft apertures therein respectively, using one such apertured link as a drill guide to longitudinally locate the positions of the shaft openings opposite said link apertures for drilling one pair of first and second pivotal shaft centers through the bed and tongue respectively, using another such apertured link to locate a drill to form a third offset pivotal center upon the hitch tongue for a shaft spaced rearwardly and upwardly from the first pivotal center on said tongue and in true parallelogram fashion, then striking an arc coincident with the center of the shaft aperture at the free end of said other link and upon said bed with a radius equal to the link length between its end apertures from the said third offset shaft center, then bodily lifting said tongue upwardly into its predetermined raised location by swinging the same upon a circular path guided by the link connecting the first two pivotal link center shaft locations, and then striking a second arc coincident with the center of the shaft aperture at the free end of said other link and of a radius equal to the link length from the third pivotal center of said tongue to intersect the first arc on said bed, and locating the fourth shaft for said other link upon a pivotal center coincident with the intersection of said two link described arcs.

---



2,772,009

**METHOD AND APPARATUS FOR OPENING AND EMPTYING PAPER CONTAINERS**

Louis Pinsonneille, Pittsburgh, Pa., assignor to National Dairy Research Laboratories, Inc., Islip, N. Y., a corporation of Delaware

Application December 21, 1951, Serial No. 262,830

10 Claims. (Cl. 214—305)

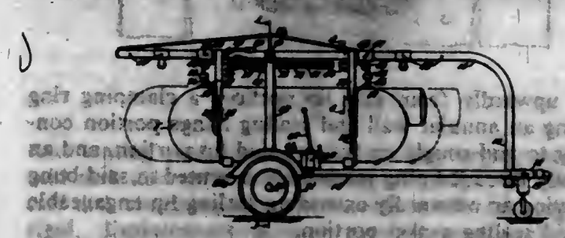
1. In a paper container opening and emptying apparatus, means for moving containers in a given path, a knife in the path of travel of the containers for slitting an intermediate portion of each container, a member behind said knife in the path of travel of the container for spreading apart the severed edges of each container and for supporting each moving container on certain of the severed edges while the contents of the container drain.

---

2,772,010

**STORAGE TANK TRAILER**

Glenn H. Boehring, Oshkosh, Wis.



Application October 13, 1954, Serial No. 462,834

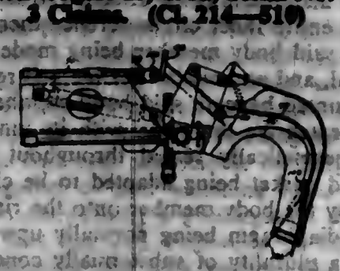
1 Claim. (Cl. 214—394)

In a trailer, the combination of a two wheeled frame including spaced side members, an overhead lengthwise extending frame member centrally disposed relative to said side members and arched frame members connecting said side members to said overhead member, spaced tank slings mounted on said overhead frame member to hold a tank in a raised position, a hydraulic cylinder

mounted on said overhead frame member and having a piston rod carrying spaced pulleys, a collar lengthwise adjustably mounted on said overhead frame member forwardly of said cylinder and carrying a pulley, a collar lengthwise adjustably mounted on said overhead frame member rearwardly of said cylinder and carrying a pulley, a pulley mounted at the rear of said cylinder, spaced cable anchorages on said overhead frame member, a cable connected to the rear end portion

of the tank and extending over the pulley on said rearwardly disposed collar forwardly to one of said pulleys on said piston rod and then rearwardly to one of said cable anchorages, a cable connected to the forward end portion of said tank and extending over the pulley on said forwardly disposed collar rearwardly over said pulley at the rear of said cylinder, thence forwardly over the other of said pulleys in said piston rod, and then rearwardly to its anchorage, and means for supplying said cylinder with pressure fluid.

---



2,772,011

**BUCKET EJECTOR FOR DIGGING APPARATUS**

Ray Forwerda, Hialeah, Fla.

Application August 15, 1952, Serial No. 304,544

3 Claims. (Cl. 214—519)

1. In combination, a boom, means mounting a scoop bucket on said boom for movement relative to said boom, an ejector blade movably mounted in said bucket for movement between a normal bucket-loading position and a bucket-dumping position, blade-movement-causing means operatively associated with said blade for moving the latter to dumping position, power means for moving said scoop bucket relative to said boom, and means operatively connected with said blade-movement-causing means and responsive to said movement of said scoop bucket relative to said boom for causing movement of said blade to its dumping position.

2,772,012

**METHOD AND DEVICE FOR MANUFACTURING CLOSURE CAPS AND CLOSURE CAP PRODUCED THEREBY**

Harold L. Crabtree, Lancaster, Ohio, assignor to Anchor Hocking Glass Corporation, Lancaster, Ohio, a corporation of Delaware

Application May 10, 1951, Serial No. 225,494

8 Claims. (Cl. 215—40)

1. A sheet metal closure cap of the class described comprising a top portion and a depending cylindrical skirt, a rubber compound forming an imperforate covering over the entire inner walls of said top portion and depending skirt, said covering having its greatest thickness along the upper portion of the skirt for telescoping over and engaging the side wall of a container, the inner surface of the covering along the lower portion of the skirt flaring downwardly, and the lower edge portion of the

skirt being turned about the lower edge of the covering and enveloping the same in clamping relation.

---

2,772,013

**CLOSURE CAP FOR GLASS CONTAINERS AND METHOD OF MAKING**

Harry E. Stover, Lancaster, Ohio, assignor to Anchor Hocking Glass Corporation, Lancaster, Ohio, a corporation of Delaware

Application December 14, 1953, Serial No. 397,876

2 Claims. (Cl. 215—40)

1. A sheet metal closure cap of the class described comprising a top portion and a depending cylindrical skirt, a rubber compound forming an imperforate covering over the entire inner walls of said top portion and depending skirt, said covering having its greatest thickness along the upper portion of the skirt for telescoping over and engaging the side wall of a container, the inner surface of the covering along the lower portion of the skirt flaring downwardly, said covering having an annular groove in said upper portion adapted to receive an annular enlargement on said container, and a lower edge portion of said skirt extending inwardly and upwardly about the lower edge portion of the covering enveloping and concealing said lower edge portion of the covering.

---

2,772,014

**TAMPER-PROOF SEAL FOR BOTTLE CLOSURE**

Preston F. Clark, Texas City, Tex., assignor to Pan American Pipe Line Company, Houston, Tex., a corporation of Delaware

Application September 17, 1954, Serial No. 456,715

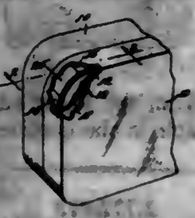
3 Claims. (Cl. 215—32)

1. A tamper-proof seal for a container having a narrow throat which comprises a strap member having transverse slots adjacent the ends thereof, an elongated deformable keeper member integral with said strap and extending transversely to an edge thereof, a longitudinal slot in said keeper member adapted to receive the slotted ends of said strap, and an expandable latch band overlying said strap and passing through said transverse slots to retain said ends within said longitudinal slot carried by said keeper when said strap member is arranged about the throat of said container.

---

2,772,015

**CORNER CONSTRUCTION FOR LUGGAGE FRAMES**



Rene Fuller, Churchville, Pa.

Application June 9, 1954, Serial No. 435,433

4 Claims. (Cl. 217—65)

1. In wooden luggage frames having a plane wall portion with a rim extending outwardly therefrom, a corner

construction for said rim wherein said rim comprises a plurality of solid wood strips having inner and outer faces and their inner faces are disposed in planes normal to each other and to said wall portion, said wood strips having terminal ends in spaced relation to each other, and a continuous and smooth faced insert between and con-

necting said terminal ends, said insert consisting of a plurality of wood layers permanently adhesively held together and having its ends disposed in planes normal to each other, said insert having its ends in meeting relation to the inner faces of the strips and joined thereto by a permanent adhesive, the outer faces of the strips having curved portions merging with the outer face of the insert.

---

2,772,816

**CONTAINER FOR RECORDING THERMOMETER**

Donald R. Bristol, Seattle, Wash., assignor to Ryan Recording Thermometer Company, Seattle, Wash., a corporation of Delaware

Application February 8, 1954, Serial No. 408,843

2 Claims. (Cl. 220—19)

1. In a container, a generally cylindrical casing open at the top and formed with a diametrically enlarged upper rim section terminating at its lower end by a downwardly sloping guide shoulder, said rim section having a pair of diametrically opposite slots located adjacent said guide shoulder, a removable disc-like cover for said casing having a circumferential groove formed in its outer edge and having a recess formed in the center of its upper face, an elastic O-ring retained in said groove and having a thickness greater than the depth of the groove, a cap screw threaded into the center of said cover and arranged with its head within said recess, a handle pivotally mounted on said head and having a gripping portion arranged to be selectively swung into and above said recess, said cover and O-ring being adapted to close and moisture seal the open top of said casing when they are located within the casing and below said slots with the O-ring compressed below said guide shoulder between said casing and the floor of said circumferential groove so that the casing can be slipped by said slots onto a supporting arm when the gripping portion of the handle is located within said recess to thereby support the container and at the same time lock said cover against withdrawal from the casing.

---

2,772,817

**PLASTIC DRUM CLOSURE**

Glenn T. Ricks, Auburn, Ind., assignor to Ricks Metal Products Corporation, Auburn, Ind., a corporation

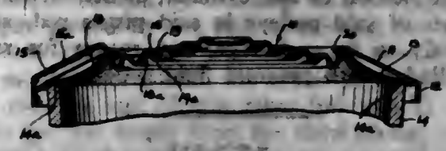
Application December 21, 1953, Serial No. 399,349

3 Claims. (Cl. 220—27)

3. A closure unit comprising a cup-shaped internally threaded bung ring composed of natural polyethylene or like material, said ring being open at the top and initially closed at the bottom by a severable diaphragm, a lip portion formed on said ring of the same material to extend radially outwardly therefrom terminating in a downwardly extending portion, an upwardly extending sealing gasket portion of the same material formed on said ring to

extend upwardly from said lip portion, a clamping ring including an annular wall and sealing flange portion conforming to and snugly embracing said lip portion, and an externally threaded plug removably mounted in said bung ring having an outwardly extending sealing lip engageable with said sealing gasket portion.

---



2,772,818

**SEALING CAP**

Gerhart Weise, Jackson Heights, N. Y.

Application September 12, 1951, Serial No. 246,183

7 Claims. (Cl. 220—44)

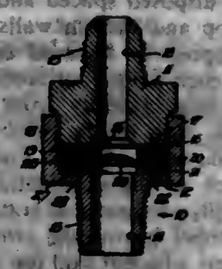
1. A sealing cap comprising a central diaphragm, an annular body member which is integral with said diaphragm, said diaphragm being attached to said body member over the entire inner circumference thereof, said diaphragm and said body member being made of relatively rigid material, and an annular flexible and resilient gasket which is mounted beneath said body member and is substantially coextensive therewith with its inner peripheral edge only hermetically sealed throughout to the body member, said gasket being adapted to be clamped at its outer edge by the body member onto the rim of the container, said diaphragm being normally upwardly convex and having a plurality of substantially concentric corrugated grooves, whereby it is adapted to be moved downwardly relative to said body member from its normal position into a downwardly convex position, said diaphragm being thereby tensioned so as to be adapted to return to its normal position upon release of the downward force thereon, said body member having a radial groove in the under-surface thereof above said gasket, said sealing cap being thereby adapted to be sealed to the rim of a container by mounting said cap on said rim with said gasket resting on said rim and with said groove overlying said rim between the inner and outer edges thereof, and depressing said diaphragm whereby to create an air pressure which forces a portion of said gasket into said groove and permits the escape of air from said container through the resulting opening between said gasket and said rim, and then releasing said diaphragm, the resulting return of said diaphragm to its normal position tending to create a partial vacuum within said container.

---

2,772,819

**RUPTURE DISK ASSEMBLY**

Evan Jones, Evanston, Ill., assignor to Henry Valve Company, Incorporated, Melrose Park, Ill., a corporation of Illinois



Application March 15, 1950, Serial No. 149,736

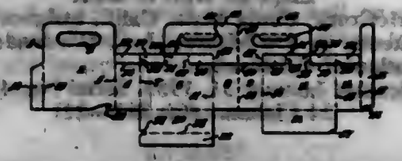
10 Claims. (Cl. 220—89)

1. In a rupture disk assembly characterized by a pair of coacting annular mounting members, a compressible sealing ring and a separate, cartridge-type rupture disk

unit disposed between said members in fluid sealing relation thereto, said unit comprising a frangible disk and a pair of concentric annular clamping elements in clamping relation to said disk adjacent the margin thereof,

said sealing ring having axial sealing engagement with said disk internally of the clamped margin of the latter, said disk clamping elements having axially telescoped and rigid, displacement-resistant securing engagement with one another independently of said mounting members.

---



2,772,820

**PARTITIONED BOTTLE CARRIER**

Joseph Kramer, Reading, Ohio, assignor to The Gardner Board and Carton Co., Middletown, Ohio, a corporation of Ohio

Application August 30, 1952, Serial No. 307,249

3 Claims. (Cl. 220—113)

1. In a blank for a partitioned bottle carrier construction, a side wall, a medially scored end wall, and a side wall in articulation in the order named, said side walls terminating upwardly in centrally disposed neck portions, adjoining handle forming parts extending above said side walls and said end wall, said handle forming parts being articulated together at their adjoining edges along a line of articulation constituting a prolongation of the medial score line in said end wall, transverse partition elements integrally connecting said neck portions and said handle forming parts, said transverse partition elements being horizontally disposed and connected to said handle forming parts along lines of articulation constituting prolongations of the lines of articulation between said side wall panels and said end wall panel.

---

2,772,821

**TOWEL DISPENSING DEVICE**

Richard C. Keddie, Old Westbury, N. Y.

Application January 16, 1952, Serial No. 266,693

3 Claims. (Cl. 221—39)

1. In an apparatus for singly dispensing multifolded paper towels having a towel supply magazine, a multi-bladed, spider-shaped member having a plurality of radially disposed blades mounted below the magazine and mounted for intermittent rotary motion, one of the blades of said member being disposed in a vertical position to normally block access to a towel depending from the magazine, said blade, upon intermittent rotary motion of said spider member, produced by manual action upon another blade, being displaceable to a position rendering said towel accessible for manual withdrawal and a further blade upon intermittent rotary motion with the spider-shaped member adapted for deflecting said towel edge forwardly and thereupon serving as a barrier preventing access to the leading edge of a following towel; a novel towel supporting means, comprising members having curved upper surfaces for engaging and supporting the lowermost towel in the magazine only along two lines parallel to the folds of the towel and spaced inwardly therefrom, whereby the undersides of the towels are given a concave configuration, the parallel supporting means being spaced apart and defining an outlet through which the towels are withdrawn from the magazine and towel guiding means positioned below the supporting means and said guiding means having a curved guiding surface which is slightly to the rear of the center line of the vertically disposed blade for guiding the towels to the inaccessible side of the blocking blade of said member.

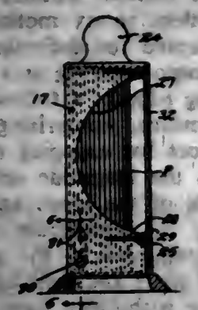
2,772,822

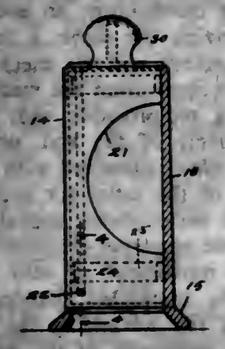
**VENDING MACHINE HAVING MULTIPLE BOTTLE CONVEYOR SYSTEM**

Ralph H. Manning, Kansas City, Mo., and Robert T. Manley, Kansas City, Kans., assignors to The Vendo Company, Kansas City, Mo., a corporation of Missouri



Application July 16, 1951, Serial No. 236,916

8 Claims. (Cl. 221—85)



1. In a vending machine, the combination of structure presenting an article-receiving passage; a pair of conveyor elements for advancing articles along the passage; reciprocable mechanism; an endless element having means for driving the same; a link pivotally interconnecting the element and the mechanism at one end of the latter for reciprocating the mechanism as the element is driven; a reciprocable rod; flexible means at each end respectively of the rod, one connected with the link and the other connected with the mechanism at the opposite end of the latter for reciprocating the rod as the mechanism reciprocates; movable apparatus coupled with one of the conveyor elements for advancing the same only upon movement of said apparatus in one direction; movable apparatus coupled with the other conveyor element for advancing the latter only upon movement of the apparatus of the other conveyor element in the opposite direction; and means coupling the rod with said apparatuses for moving the latter simultaneously first in said one direction and thence in said opposite direction alternately as the rod reciprocates.

2,772,023
**CONDIMENT AND TOOTHPICK HOLDER AND DISPENSER**
Lloyd A. Smith, Washington, D. C., assignor of one-fourth to Morris R. Smith, Washington, D. C.
Application February 4, 1952, Serial No. 269,826
1 Claim. (Cl. 221—282)

A toothpick holder and dispenser comprising a normally horizontal base, said base having a pair of integrally formed substantially rectangular side walls projecting upwardly therefrom in spaced substantially parallel relation, an end wall projecting upwardly from said base and formed integrally therewith, said end wall extending substantially parallel to said side walls and integrally connecting a pair of adjacent upwardly extending edges thereof, said side and end walls defining a receptacle having an open end and top, a toothpick holder comprising a substantially rectangular parallelepipedon having spaced and parallel pairs of side and end walls, and spaced parallel top and bottom walls, each of said side walls having an arcuate cut out formed therein in registry with each other, said cut outs extending from a point adjacent said top wall to a point adjacent said bottom wall, one of said end walls having a cut out portion extending from said point adjacent said top wall to said point adjacent said bottom wall, said side walls each having a slit formed therein adjacent said top and bottom walls, said slits extending inwardly from said one end wall to form vertically spaced pairs of horizontally spaced tines, said horizontally spaced tines of each pair being bent arcuately towards each other into substantially abutting relationship, said parallelepipedon being normally disposed within said receptacle, and bayonet and slot means detachably securing said parallelepipedon and said receptacle with said one end wall of said parallelepipedon confronting said one end wall of said receptacle.

2,772,024
**CONDIMENT AND TOOTHPICK HOLDER AND DISPENSER**
Lloyd A. Smith, Arlington, Va.
Application November 4, 1952, Serial No. 318,683
1 Claim. (Cl. 221—282)

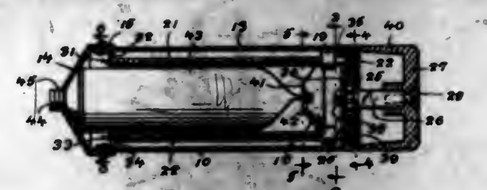
A toothpick holder comprising a base having a pair of elongated spaced parallel and confronting vertically extending side walls, an end wall connecting a pair of adjacent longitudinal edges of said side walls, each of said side walls having a vertically extending guide slot formed therein adjacent their respective other confronting longitudinal edges, said slots extending downwardly from the upper ends of said side walls and terminating adjacent the other ends thereof, a substantially rectangular container having oppositely disposed spaced and substantially parallel side walls, top and bottom walls, and an end wall confronting an oppositely disposed open end, said last named side walls each having an arcuate cut-out formed therein and extending inwardly from said open end, a channel formed in each of the confronting surfaces of said last named side walls adjacent said top wall, a channel formed in each of the confronting surfaces of said last named side walls adjacent said bottom wall, a resilient U-shaped clip member having the arms thereof disposed within said channels adjacent said top wall with the bight thereof engaging said last named end wall, a second resilient U-shaped clip member having the arms thereof disposed within said channels disposed adjacent said bottom wall with the bight thereof engaging said end wall, each of said clip members having the free ends of their respective arms bent in a converging direction, and a pin projecting laterally from the remote surfaces of each of said last named side walls, said pins being slidably engaged within said slots and forming pivot means for said receptacle, said pins being disposed adjacent said bottom wall.

2,772,025
**LIQUID DISPENSER**
John F. McCrory, Chula Vista, Calif., assignor, by mesne assignments, to Tru-Measur, Inc., Coronado, Calif., a corporation of California
Application January 31, 1955, Serial No. 484,933
14 Claims. (Cl. 222—21)

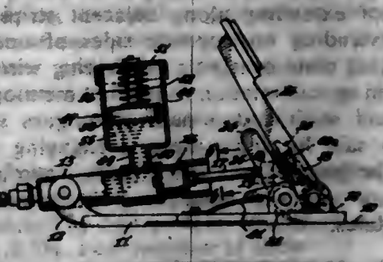
1. A dispenser of the character described comprising a housing, a cylinder disposed in said housing and having an open lower end, a piston having a lower discharge end extending downwardly from said housing and an upper end extending slidably into the lower end of said cylinder, said piston having a passage extending longitudinally therethrough, spring actuated means connected to said housing and piston for urging the piston inwardly of the cylinder, a downwardly opening valve mounted in said passage, spring means normally maintaining said valve in a closed position, a supply source for a medium to be dispensed, means connecting said supply source to the other upper end of said cylinder, a driven means engaging said spring actuated means and normally holding the spring actuated means in a position to prevent the piston from being displaced upwardly thereby, and means to actuate said driven means for movement thereof to permit upward displacement of the piston by said spring actuated means for applying a pressure to the medium to be dispensed contained within said cylinder for unseating the valve for discharge of the medium from the lower end of said piston passage, said driven means subsequently returning the spring actuated means to its initial position for displacing the piston downward to close said valve and create a vacuum in said cylinder for refilling the cylinder from said supply source.

2,772,026
**COLLAPSIBLE TUBE SQUEEZER**
Lawrence E. Harrington, Sepulveda, Calif., assignor of one-half to Walter W. Bullock, Alhambra, Calif.
Application February 2, 1955, Serial No. 485,669
7 Claims. (Cl. 222—82)

1. A tube squeezer comprising a housing having a top wall, and side walls and open at its forward end, a tube squeezing panel in said housing having side margins extending adjacent the inner faces of said side walls, said panel being pivotally connected at its inner end to swing toward and away from the under side of said top wall, a handle fixed to said housing and projecting therebeneath, a lever pivoted to said handle and normally extending in angular relation thereto, and means on said lever for actuating said panel toward said top wall on advancing said lever and handle toward each other to thereby squeeze a tube interposed longitudinally between said top wall and panel.



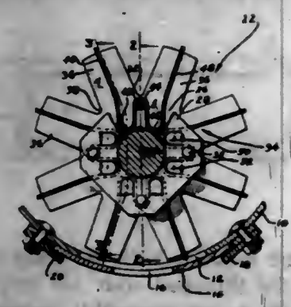
2,772,027
**DISPENSING CAPS FOR COLLAPSIBLE TUBES**
Lawrence E. Chirop, Mount Clemens, Mich.
Application November 10, 1954, Serial No. 468,021
1 Claim. (Cl. 222—92)



A dispensing cap for collapsible tubes, the cap comprising a base having a threaded socket therein for application to the orifice portion of a collapsible tube the base being of a diameter equal to that of the tube, a tubular neck axially rising from the base and opening at the lower end into the socket of the base, but being closed at the top, the neck having in its side wall an outlet port and having in said wall, in a diametrical position to said port, a slot in the shape of an inverted letter U, a cylindrical closure telescopically seated over the neck, the closure being provided with a radially-extending spout, the spout being normally out of register with said outlet port, but being adapted to be brought into register therewith by a partly rotary movement of the closure about the axis of said neck, and an integrally-formed crown at the top of the closure, the crown being of a diameter in excess of that of the closure, but having a portion cut off on a line of chord above the said spout.

2,772,028
**DISPENSER FOR MATERIAL IN COLLAPSIBLE TUBES**
Peter R. Lopez, Richmond, Calif.
Application March 16, 1955, Serial No. 493,335
3 Claims. (Cl. 222—95)

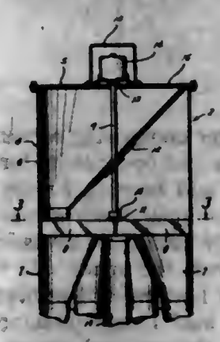
3. In a dispenser for material in collapsible tubes, the combination which comprises an elongated casing, rectangular shape in cross section, threaded rods rotatably mounted in corners of the casing, a traveling plunger having internally threaded hubs positioned with the hubs on said threaded rods, a knob rotatably mounted on the casing, gears mounted on said threaded rods, a gear rotatably mounted in the casing and adapted to be actuated by the knob, said gear being adapted to be actuated by the knob meshing with the gears on the threaded rods whereby the threaded rods are rotated upon rotation of the knob, a cap removably mounted on the end of the casing opposite to the end on which the knob is positioned and having a centrally positioned opening therein adapted to receive a threaded nipple of a collapsible tube positioned in the casing, said cap being retained in position with spring actuated buttons.



2,772,029
**MEANS FOR FILLING GREASE CUPS ON AUTOMOTIVE VEHICLES**
Jerry S. De Lucia, Bronx, N. Y.
Application June 20, 1955, Serial No. 516,467
7 Claims. (Cl. 222—179)

1. In a device of the class described, a cylinder having an outlet at its front end, a base having a raised portion at the front thereof, said cylinder being pivoted near said end thereof to said raised portion, a piston slidably mounted in the cylinder and having a piston rod extending from the rear end of the cylinder, an operating lever arm pivoted on an axis substantially parallel with the pivotal axis of the cylinder near the rear end of said rod, a shaft rotatably mounted at substantially the level of the pivotal axis of said lever above the base and positioned forward of said pivotal axis of the lever, said shaft having a sleeve fixed thereon, said sleeve having a lug thereon, the rear end of said rod being pivoted to said lug, a second sleeve fixed on said shaft adjacent said first sleeve and having a lug thereon, said second lug having a pin extending from that side thereof opposite said first sleeve, said shaft having a third sleeve fixed thereon, a member on that side of said lever adjacent said second sleeve so positioned thereon to engage said pin upon swinging of said lever in one direction and thus to swing said second lug in the same direction and hence to move said piston rod and said piston forward in said cylinder to force grease through the piston outlet, resilient means for restoring said lugs and hence said piston to their original inoperative positions, a grease supply chamber having an outlet into said cylinder on the outlet side of the piston, and means in said chamber normally urging the grease therein into the cylinder, said cylinder having a check valve in the outlet thereof normally closed except when the piston is moving toward the front end of the cylinder.

2,772,630
**FEEDING ROTORS FOR FERTILIZER DISTRIBUTORS**
Donald J. Christensen, Kenosville, and Armand A. Salerno, Racine, Wis., assignors to J. I. Case Company, Racine, Wis., a corporation of Wisconsin
Application June 30, 1955, Serial No. 519,092
5 Claims. (Cl. 222—242)



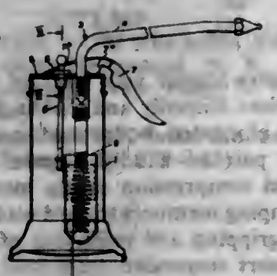
1. In a feeding rotor for a fertilizer distributor of the type including an elongated fertilizer hopper supported for movement over the ground transversely of the length of said hopper a series of discharge openings in the bottom of the hopper and a rotating shaft adjacent the bottom of the hopper; a rotor on said shaft comprising a disk-like plate including an even number of substantially radially extending strips, uniformly circumferentially spaced about said shaft in a common plane substantially normal thereto and providing notches therebetween, a rivet extending through said plate adjacent the apex of alternate notches formed between said strips, a W-shaped finger member of spring wire having the outer fingers thereof extending along adjacent strips and the inner legs extending on opposite sides of one of said rivets, a locking plate overlying said spring wire member and secured in spaced relation to the first mentioned plate, axially of said shaft and a pair of tongues struck inwardly from said locking plate and engaging said wire member at the base of said side fingers whereby to prevent escape of said wire member from its position between said plates.

2,772,631
**FLUID GUN**
Harold A. Rosebud, Dayton, Ohio, assignor to C. W. Harwin, Inc., Dayton, Ohio, a corporation of Ohio
Application December 2, 1952, Serial No. 323,636
12 Claims. (Cl. 222—324)

12. In a fluid pump mechanism comprising a pump cylinder having an inlet port provided with a check valve, an elongate hollow handle member, a guide bearing joining the pump cylinder to the handle member, a hollow piston rod within the pump cylinder and extending through the guide bearing and into the handle member, a piston attached to the piston rod at the lower end thereof, said hollow piston rod having an aperture at the lower end thereof connecting the interior of the hollow piston rod to the pump cylinder forming an outlet port for fluid within the cylinder, said hollow piston rod having a second aperture spaced above the first aperture, the hollow piston rod having a portion of its outer surface cut away adjacent the second aperture forming an air vent for exhausting air trapped in the upper end of said pump cylinder, pump operating means comprising a bell crank having two arms, one arm thereof serving as a pump operating trigger pivotally attached adjacent the handle member, and a link having one end operatively connected to said hollow piston rod and having its other end operatively connected to the second arm of said bell crank.

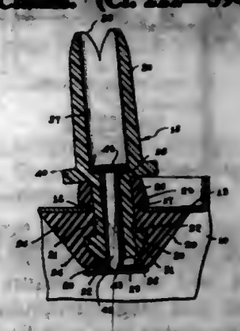
2,772,632
**ROTARY VALVE**
Sidney M. Pattillo, Rosebud, Tex.
Application February 28, 1955, Serial No. 491,147
6 Claims. (Cl. 222—330)

1. Valve means comprising a vertically disposed cylindrical housing, a hopper disposed within the upper portion of the housing and rotatably mounted therein, the upper end of the hopper having a diameter approaching the inside diameter of the housing and the lower end thereof being of smaller diameter than its upper end and being positioned eccentrically with respect to the housing, a plurality of hoppers arranged circumferentially below the first mentioned hopper, the upper ends of the last mentioned hoppers each comprising a sector of a circle having a diameter corresponding to the inside diameter of the housing, the lower end of each of the last mentioned hoppers being smaller than its upper end and being positioned eccentrically with respect to the housing, the last mentioned hoppers each being adapted to receive material as discharged from the first mentioned hopper when the lower end of the first mentioned hopper is aligned circumferentially therewith.



2,772,633
**VALVE MECHANISM FOR TOOTH PASTE DISPENSER**
Frank Gerard, Baltimore, Md.
Application June 10, 1954, Serial No. 435,877
4 Claims. (Cl. 222—340)

1. A paste dispenser comprising in series a reservoir compartment for tooth paste, an intermediate chamber, a vestibule and an outlet orifice, a longitudinally perforated piston separating the compartment from the chamber and disposed to reciprocate in said chamber and closely fit therein, a perforated partition between said chamber and said vestibule, said piston having an external spindle, a valve rod having a valve flange at its lower end, a bore in said valve rod extending upwardly from the bottom face of said valve flange, a pin-receiving slot in said valve rod and spaced from said valve flange, said spindle on the piston projecting into said bore in the valve rod and being adapted to reciprocate within said bore, a pin connected to said spindle and projecting into said pin-receiving slot in said valve rod for limiting reciprocation of said spindle in said bore, a loose valve disc in said vestibule, a shaft fastened to said perforated partition and projecting downward into said vestibule and through said loose valve disc in said vestibule and having a valve stop spaced from the bottom of the perforated partition, said valve disc being disposed to slide along said shaft and between the perforated partition and said valve stop and to close the perforated portion of said partition against passage of paste therethrough when resting against said partition, said valve flange being disposed to close the perforated portion of said piston against passage of paste therethrough when resting on said piston, a slider disposed below said outlet orifice and adapted to be pushed by a tooth brush, a lever system connected to said valve rod and adapted to be actuated by said slider and to reciprocate said valve rod.



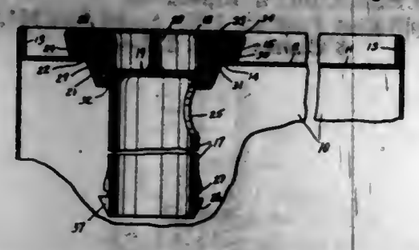
2,772,634
**PUMP SHAFT SEAL FOR HAND OILERS**
Roy H. Richmond, Jr., Wellsburg, W. Va., assignor to Eagle Manufacturing Company, Wellsburg, W. Va., a corporation of West Virginia
Application August 6, 1953, Serial No. 372,747
4 Claims. (Cl. 222—341)

1. The combination with a cap closure of a hand oiler having an opening therein provided with an in-turned lip and a pump shaft reciprocable through said opening, of a seal comprising a rubber body having an annular groove in its outer surface for reception of the in-turned lip of the cap opening, the inner diameter of said groove being slightly larger than the diameter of said cap closure lipped opening, the outer surface of said body having a downwardly converging taper from a maximum diameter at the lower edge of said groove to a minimum diameter at the bottom of said body and with said minimum diameter being substantially the same as the diameter of said lipped closure opening to facilitate axial movement of said body to a mounted position in said opening, said cap closure having its lipped periphery defining the opening therein of greater axial depth than that of said groove and positioned in said body groove to provide a tensioned liquid sealing engagement with said body when in its mounted position with respect thereto, said body having an axially extending opening the surface of which has a taper converging axially downwardly from a maximum diameter at the upper end of said body to a minimum diameter at the lower end of said body with said maximum diameter being slightly less than the diameter of said shaft, said shaft extending through said body opening and having sliding engagement with the surface of said body opening.

2,772,635
**DISPENSING VALVE FOR A PRESSURIZED CONTAINER**
Leonard M. Collins, Los Angeles, and Philip F. George, Arcadia, Calif., assignors to Pressure Dispensers, Inc., Beverly Hills, Calif., a corporation
Application June 15, 1953, Serial No. 361,708
8 Claims. (Cl. 222—394)

1. A dispensing valve for a pressurized container comprising: a resilient grommet adapted to be mounted in an opening in said container and having an axial bore therethrough with an enlarged recess extending laterally from said bore in the portion of said grommet inwardly of said opening; a rigid tubular body fitted tightly within said bore and having a locking projection seated within said recess, said body having a nozzle portion extending outwardly beyond said grommet and said body being seated against the portion of said grommet outwardly of said opening to compress said grommet in sealing engagement with said container; and a valve stem extended through said body in floating relationship thereto and defining therewith a passageway for the flow of material from said container, said stem having a head on the inner end for seating against the inner face of said grommet.

2,772,636
**MATERIALS HANDLING EQUIPMENT**
Lindsey West Shea and Joseph C. Strab, Canton, Ohio, assignors to The Union Metal Manufacturing Company, Canton, Ohio, a corporation of Ohio
Application March 15, 1954, Serial No. 416,360
5 Claims. (Cl. 222—457)



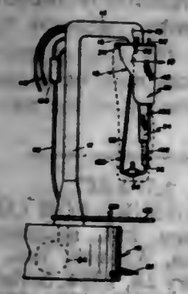
1. In materials handling work positioning equipment, tray bottom and side walls forming an upwardly forwardly opening tray member having a front end, barrier means for the front end of the tray member, the barrier means including a transverse member extending between the tray side walls and below the tray bottom wall, spaced pins mounted on the transverse member projecting vertically upward thereof at the front end of the tray member, said pins providing upwardly opening recesses therebetween, and means removably mounting said barrier means on the tray member, whereby the barrier means retains workpieces on the tray member, and whereby such retained workpieces may be grasped through said recesses and lifted upwardly of the tray member for removal.

2,772,637
**POUR SPOUT CLOSURE FOR CONTAINERS**
Glenn T. Rieke, Auburn, Ind., assignor to Rieke Metal Products Corporation, Auburn, Ind., a corporation
Application February 16, 1954, Serial No. 410,686
7 Claims. (Cl. 222—481)

1. A pour spout closure for a container having an opening surrounded by an upstanding neck, an internally

threaded flange extending through said opening in sealing relation with said neck, a tubular pouring spout slidable in said flange open at its inner end and provided with a pouring hole in its wall adjacent its other end, an externally threaded plug integral with said spout providing a closure at said other end for threaded sealing engagement with said flange, a flange lip integral with said flange surrounding said neck, a closure lip integral with and severable from said plug surrounding said flange lip, and a clamping ring embracing said lips crimped thereon to effect a permanent seal with said neck.

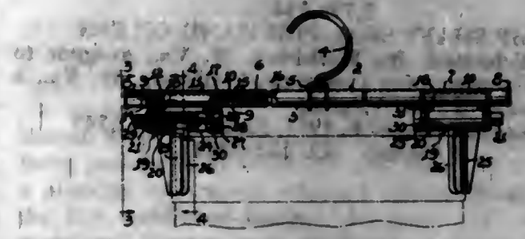
---



**2,772,038**
**METERING CONTROL FOR FERTILIZER SPREADERS**
Patrick W. Merriman, Racine, Wis., assignor to J. I. Case Company, Racine, Wis.
Application August 17, 1953, Serial No. 374,523
7 Claims. (Cl. 222—485)

1. A metering control device for fertilizer spreaders and the like wherein hopper discharge ports are opened and closed by a sliding valve plate having corresponding ports adapted to adjustably register with the hopper discharge ports, comprising a pivotal lever connected to the slide plate to actuate the same, one extreme position of said lever corresponding to a closing of said discharge ports and the opposite extreme position of said lever corresponding to a full opening of said discharge ports, a circular cam abutment plate eccentrically mounted in the path of said lever and adjustably rotatable on an axis parallel to the pivotal axis for the lever to limit the movement of the lever toward said opposite position and thereby determine the adjusted opening of said ports, and means to lock said circular plate in any one of numerous selectable positions to provide fine increments of adjustment for said discharge ports throughout the range of opening of the same.

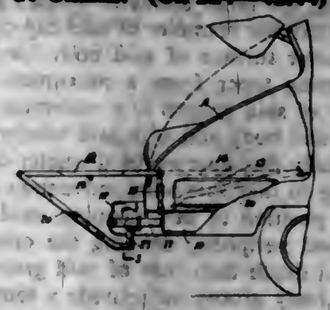
---



**2,772,039**
**GARMENT FINISHING APPARATUS**
Frank G. Hoover and Harry E. McCollough, Escondido, and Charles H. Free, Pasadena, Calif.
Application March 4, 1955, Serial No. 492,074
3 Claims. (Cl. 223—73)

1. A garment finishing apparatus comprising: a base; an upright hollow pillar fixed on said base; said pillar having a laterally extending upper portion; a garment holder assembly suspended from said portion; said holder assembly including a fixed plate mounted on said portion: guide rails secured beneath said fixed plate normal to said upper portion; a pair of side plates having spaced extended guide bars slidably engageable in said rails; a downwardly extending, rigid side form panel fixed to each of said side plates; said side form panels being perforated and shaped to engage in the waistband portion of a garment; porous covers secured to said form panels; and means for laterally adjusting the spacing of said form panels; spring clips mounted on each of said side plates and extending downwardly over said form panels to engage and retain a garment thereon; a rigid pleat presser pivotally mounted on each of said side plates to swing downwardly against the surfaces of said side form panels; said pleat pressers being perforated and shaped to fit closely the surface of said form panels; and porous covers secured on said pleat pressers; a toggle mechanism operatively connected to said pleat pressers to lock the same in place against said form panels; a pair of downwardly extending leg elements secured to said fixed plate; and means for conducting fluids through said leg elements.

---



**2,772,040**
**TROUSERS HANGER**
George Kajcsa, Cleveland, Ohio
Application February 1, 1955, Serial No. 485,407
4 Claims. (Cl. 223—96)

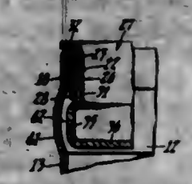
1. A trousers hanger with pairs of aligned trousers leg gripping devices hingedly and yieldingly slidably suspended from an elongated body, said gripping devices each including a pair of axially aligned shiftable clamping members and compression spring means yieldingly forcing said clamping members toward each other to automatically effect gripping and reshaping of creased areas of a pair of trousers suspended from said trousers hanger.

---

**2,772,041**
**AUTOMOBILE TRUNK EXTENSION**
George J. Zeuhert, Detroit, Mich.
Application September 23, 1954, Serial No. 457,929
10 Claims. (Cl. 224—42.44)

1. An automobile trunk platform comprising a substantially flat floor having two opposing ends, widely spaced support posts adapted to be connected within the rear end of an automobile trunk, said platform normally occupying a position in the automobile trunk with one of said floor ends being positioned between and permanently hinged to said support posts, means for adjusting the hinged connection between the said floor end and the said support posts, the other of said floor ends being adapted to be swung rearwardly beyond the backmost portion of said automobile, and strut means connecting said other floor end to said automobile frame and holding said floor in a substantially horizontal position.

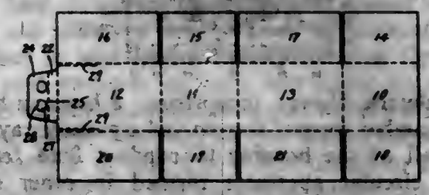
---



**2,772,042**
**CARTONS**
Walter Thomas Stephen Hendrick, Beckenham, England, assignor to J. Lyons & Company Limited, London, England, a British company
Application June 30, 1953, Serial No. 365,070
Claims priority, application Great Britain July 8, 1952
6 Claims. (Cl. 229—41)

1. A carton made up from a single blank of foldable material, said carton having a part tubular body comprising a series of side-by-side conjoined wall panels, at each end of said body a hexagonal closure panel joined to one of said wall panels and normal thereto, a spacing panel coupled to said hexagonal panel, normal thereto and extending inwardly therefrom, a panel joined to said spacing panel and normal thereto to lie parallel to but spaced from said hexagonal panel and an auxiliary end panel joined to another of said wall panels, normal thereto and extending between said hexagonal panel and said panel coupled thereto and beneath said spacing panel.

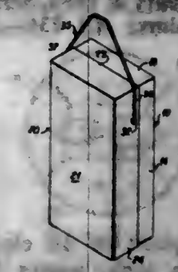
---



**2,772,043**
**FIBRE CONTAINER WITH RECLOSURE COVER**
Delbert C. Feord, West Hempstead, N. Y., assignor to American Can Company, New York, N. Y., a corporation of New Jersey
Application April 3, 1953, Serial No. 346,677
7 Claims. (Cl. 229—43)

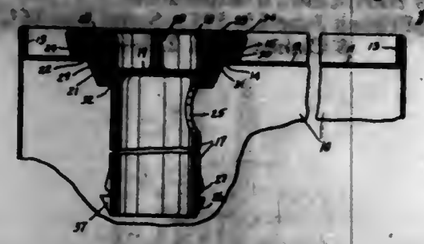
1. A container comprising a fibrous body member having a closed bottom and connected upright side walls terminating in an inwardly offset reversely folded depending straight peripheral flange disposed parallel and adhesively secured to said body side walls to constitute a peripheral friction seat wall of double thickness defining the open container mouth, said connected side walls having a laterally outwardly offset peripheral portion beneath said friction seat wall, said seat wall flange terminating in a freely depending resilient flange extension constituting an annular closure member locking wall of single thickness surrounding the container mouth, the inner terminal end of said depending flange extension being spaced laterally inwardly from said offset peripheral portion of the body side walls beneath said friction seat wall, a cup-shaped friction plug closure member insertable in said mouth for closing the container, said closure member having a countersunk panel wall and an upstanding substantially straight peripheral friction wall for fitting closely against said friction seat wall of the body member, the inner end of said countersunk closure member panel wall beneath its said straight friction wall having preformed peripheral portions extending laterally outwardly beyond the plane of said friction wall seat for yieldable engagement beneath said resilient locking flange extension of said body member to removably secure the closure member in place on the container mouth, and a pull tab on said closure member for pulling the latter free from beneath said locking wall to open the container without damaging said locking wall and said laterally extending peripheral panel wall portions of the closure member, whereby the latter may be utilized to reclose the container.

---



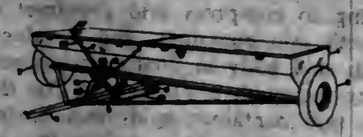
**2,772,044**
**HANDLED CARTON**
Harold W. Layne, Beech Grove, Ind., assignor to Inland Container Corporation, Indianapolis, Ind., a corporation
Application August 17, 1954, Serial No. 450,412
2 Claims. (Cl. 229—51)

1. A handled carton of fibreboard having side and end walls with hinged bottom and top closure flaps, a securing flap hinged to one of said walls as an extension thereof to overlap and lie flat against a portion of an adjacent wall, a carton carrying handle portion formed integral with and extending from said extension to initially lie flat against said adjacent wall adapted to be bent outwardly therefrom when put to use as a carrying handle, means for securing said extension to said adjacent wall for defining and securing said handle portion, and a pair of spaced parallel tear lines extending inwardly of said one of said walls from opposite ends of said securing flap to permit a portion of said wall to be ripped open upon jerking said handle portion and flap free of said securing means.



---

**2,772,045**
**CONTAINER FOR SHOES AND THE LIKE**
Leo C. Pace, Asheville, N. C.
Application February 28, 1955, Serial No. 491,021
6 Claims. (Cl. 229—62)



1. A container comprising a substantially rectangular body provided with a bottom, first and second side walls and first and second end walls, a cover for said body comprising a top wall, third and fourth side walls and third and fourth end walls, said end walls and side walls of the cover being substantially one-half the width of the end walls and side walls of said body and being adapted to fit snugly about the corresponding walls of said body, said first and third side walls and said second and fourth side walls having respective coinciding eyelets therethrough when the container is closed located at points substantially halfway between the bottom wall of the body and the opposite edges of the first and second side walls and also being located adjacent said first end wall, a double-ended pliable handle formed into a loop and having opposed ends thereof projecting inwardly through the eyelets in the third and fourth side walls and

threaded flange extending through said opening in sealing relation with said neck, a tubular pouring spout slidable in said flange open at its inner end and provided with a pouring hole in its wall adjacent its other end, an externally threaded plug integral with said spout providing a closure at said other end for threaded sealing engagement with said flange, a flange lip integral with said flange surrounding said neck, a closure lip integral with and severable from said plug surrounding said flange lip, and a clamping ring embracing said lips crimped thereon to effect a permanent seal with said neck.

2,772,038
METERING CONTROL FOR FERTILIZER SPREADERS
Patrick W. Morrissey, Racine, Wis., assignor to J. I. Case Company, Racine, Wis.
Application August 17, 1953, Serial No. 374,523
7 Claims. (Cl. 222—485)

1. A metering control device for fertilizer spreaders and the like wherein hopper discharge ports are opened and closed by a sliding valve plate having corresponding ports adapted to adjustably register with the hopper discharge ports, comprising a pivotal lever connected to the slide plate to actuate the same, one extreme position of said lever corresponding to a closing of said discharge ports and the opposite extreme position of said lever corresponding to a full opening of said discharge ports, a circular cam abutment plate eccentrically mounted in the path of said lever and adjustably rotatable on an axis parallel to the pivotal axis for the lever to limit the movement of the lever toward said opposite position and thereby determine the adjusted opening of said ports, and means to lock said circular plate in any one of numerous selectable positions to provide fine increments of adjustment for said discharge ports throughout the range of opening of the same.

2,772,039
GARMENT FINISHING APPARATUS
Frank G. Hoover and Harry E. McCelengh, Escondido, and Charles H. Free, Pasadena, Calif.
Application March 4, 1955, Serial No. 492,974
3 Claims. (Cl. 223—73)

1. A garment finishing apparatus comprising: a base; an upright hollow pillar fixed on said base; said pillar having a laterally extending upper portion; a garment holder assembly suspended from said portion; said holder assembly including a fixed plate mounted on said portion; guide rails secured beneath said fixed plate normal to said upper portion; a pair of side plates having spaced extended guide bars slidably engageable in said rails; a downwardly extending, rigid side form panel fixed to each of said side plates; said side form panels being perforated and shaped to engage in the waistband portion of a garment; porous covers secured to said form panels; and means for laterally adjusting the spacing of said form panels; spring clips mounted on each of said side plates and extending downwardly over said form panels to engage and retain a garment thereon; a rigid pleat presser pivotally mounted on each of said side plates to swing downwardly against the surfaces of said side form panels; said pleat pressers being perforated and shaped to fit closely the surface of said form panels; and porous covers secured on said pleat pressers; a toggle mechanism operatively connected to said pleat pressers to lock the same in place against said form panels; a pair of downwardly extending leg elements secured to said fixed plate; and means for conducting fluids through said leg elements.

2,772,041
AUTOMOBILE TRUNK EXTENSION
George J. Zenhart, Detroit, Mich.
Application September 23, 1954, Serial No. 457,929
10 Claims. (Cl. 224—42.44)

1. An automobile trunk platform comprising a substantially flat floor having two opposing ends, widely spaced support posts adapted to be connected within the rear end of an automobile trunk, said platform normally occupying a position in the automobile trunk with one of said floor ends being positioned between and permanently hinged to said support posts, means for adjusting the hinged connection between the said floor end and the said support posts, the other of said floor ends being adapted to be swung rearwardly beyond the backmost portion of said automobile, and strut means connecting said other floor end to said automobile frame and holding said floor in a substantially horizontal position.

2,772,042
CARTONS
Walter Thomas Stephen Hendrick, Bochurnham, England, assignor to J. Lyons & Company Limited, London, England, a British company
Application June 30, 1953, Serial No. 365,070
Claims priority, application Great Britain July 8, 1952
6 Claims. (Cl. 229—41)

1. A carton made up from a single blank of foldable material, said carton having a part tubular body comprising a series of side-by-side conjoined wall panels, at each end of said body a hexagonal closure panel joined to one of said wall panels and normal thereto, a spacing panel coupled to said hexagonal panel, normal thereto and extending inwardly therefrom, a panel joined to said spacing panel and normal thereto to lie parallel to but spaced from said hexagonal panel and an auxiliary end panel joined to another of said wall panels, normal thereto and extending between said hexagonal panel and said panel coupled thereto and beneath said spacing panel.

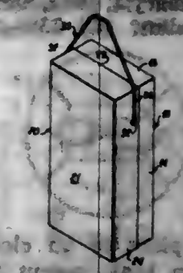
2,772,043
FIBRE CONTAINER WITH RECLOSURE COVER
Delbert C. Beard, West Hempstead, N. Y., assignor to American Can Company, New York, N. Y., a corporation of New Jersey
Application April 3, 1953, Serial No. 346,677
7 Claims. (Cl. 229—43)

1. A container comprising a fibrous body member having a closed bottom and connected upright side walls terminating in an inwardly offset reversely folded depending straight peripheral flange disposed parallel and adhesively secured to said body side walls to constitute a peripheral friction seat wall of double thickness defining the open container mouth, said connected side walls having a laterally outwardly offset peripheral portion beneath said friction seat wall, said seat wall flange terminating in a freely depending resilient flange extension constituting an annular closure member locking wall of single thickness surrounding the container mouth, the inner terminal end of said depending flange extension being spaced laterally inwardly from said offset peripheral portion of the body side walls beneath said friction seat wall, a cup-shaped friction plug closure member insertable in said mouth for closing the container, said closure member having a countersunk panel wall and an upstanding substantially straight peripheral friction wall for fitting closely against said friction seat wall of the body member, the inner end of said countersunk closure member panel wall beneath its said straight friction wall having preformed peripheral portions extending laterally outwardly beyond the plane of said friction wall seat for yieldable engagement beneath said resilient locking flange extension of said body member to removably secure the closure member in place on the container mouth, and a pull tab on said closure member for pulling the latter free from beneath said locking wall to open the container without damaging said locking wall and said laterally extending peripheral panel wall portions of the closure member, whereby the latter may be utilized to reclose the container.

---

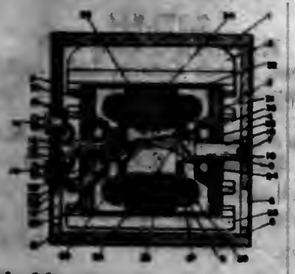


2,772,044
HANDLED CARTON
Harold W. Layne, Beech Grove, Ind., assignor to Inland Container Corporation, Indianapolis, Ind., a corporation
Application August 17, 1954, Serial No. 450,412
2 Claims. (Cl. 229—51)

1. A handled carton of fibreboard having side and end walls with hinged bottom and top closure flaps, a securing flap hinged to one of said walls as an extension thereof to overlap and lie flat against a portion of an adjacent wall, a carton carrying handle portion formed integral with and extending from said extension to initially lie flat against said adjacent wall adapted to be bent outwardly therefrom when put to use as a carrying handle, means for securing said extension to said adjacent wall for defining and securing said handle portion, and a pair of spaced parallel tear lines extending inwardly of said one of said walls from opposite ends of said securing flap to permit a portion of said wall to be ripped open upon jerking said handle portion and flap free of said securing means.

---

2,772,045
CONTAINER FOR SHOES AND THE LIKE
Lee C. Pace, Asheville, N. C.
Application February 28, 1955, Serial No. 491,021
6 Claims. (Cl. 229—52)



1. A container comprising a substantially rectangular body provided with a bottom, first and second side walls and first and second end walls, a cover for said body comprising a top wall, third and fourth side walls and third and fourth end walls, said end walls and side walls of the cover being substantially one-half the width of the end walls and side walls of said body and being adapted to fit snugly about the corresponding walls of said body, said first and third side walls and said second and fourth side walls having respective coinciding eyelets therethrough when the container is closed located at points substantially halfway between the bottom wall of the body and the opposite edges of the first and second side walls and also being located adjacent said first end wall, a double-ended pliable handle formed into a loop and having opposed ends thereof projecting inwardly through the eyelets in the third and fourth side walls and

through the eyelets in the first and second side walls, and means restraining the free ends of the pliable handle from being pulled out of said eyelets.

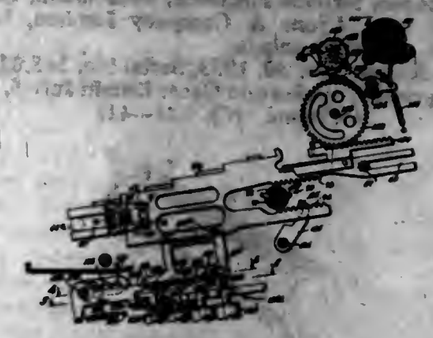
---

2,772,946
**ELECTRIC BLOWER**
George J. Sheumpke, Nashua, N. H., assignor to Sanders Associates, Incorporated, Nashua, N. H.
Application November 23, 1953, Serial No. 393,695
7 Claims. (Cl. 230—117)

1. An electric blower, comprising: a housing having a plenum chamber formed therein and a passageway formed in one wall of the housing to conduct fluid from said chamber; circular apertures formed in other opposite walls of said housing for access to said chamber; perforated circular disks secured in said apertures to form walls for said chamber, said disks having eccentrically disposed shaft-mounting holes formed therein; a shaft member extending through said chamber and supported in said shaft-mounting holes thereby enabling accurate alignment of said shaft along a given axis by rotating said circular disks; field windings including a core mounted on said shaft for producing a rotating field when connected to a source of current; electrical conductors extending from said field windings to input terminals; and a fan mounted for rotation about said shaft member and including a ring member encircling and spaced from said core whereby the rotating field around said core effects rotation of said fan.

---

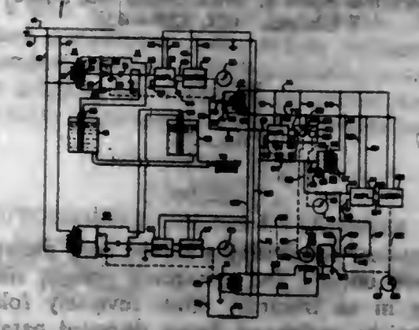
2,772,947
**VACUUM PLANT LOCATED IN PRE-VACUUM TANK**
Heinrich Sonnberger, Heidenheim (Brenz), Germany, assignor to Carl Zeiss, Heidenheim (Brenz), Germany
Application January 4, 1952, Serial No. 264,997
2 Claims. (Cl. 230—232)



1. In a vacuum plant of an electron microscope a hermetic pre-vacuum tank, means for exhausting said tank, said means being a pre-exhausting pump with an inlet in the interior of said tank and an outlet outside of said tank, as well as a motor coupled with said pre-exhausting pump, said pre-exhausting pump being suspended in the interior of said pre-vacuum tank for reducing the noise of said pump if being in operation.

---

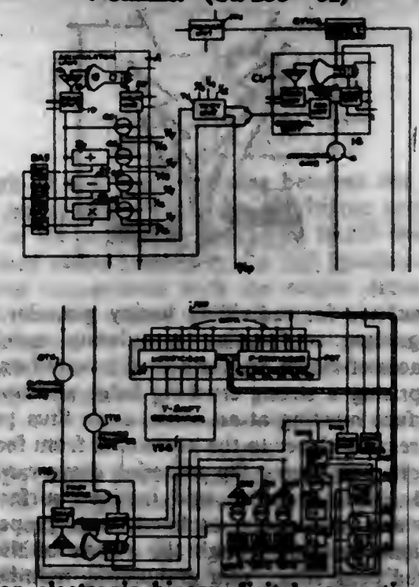
2,772,948
**READOUT UTILIZING RADIX CONVERSION FOR AN ELECTRONIC CALCULATOR**
William F. Colleran, Pasadena, and Fred N. Schwend, El Monte, Calif., assignors to Clary Corporation, a corporation of California
Application March 15, 1954, Serial No. 416,141
12 Claims. (Cl. 235—58)



1. In a computing system, a read-out device comprising the combination of a registering element differentially settable to different registering positions, means comprising a differential actuator for said element; means for advancing said actuator, a plurality of stops having interengaging portions of different lengths adapted to arrest said actuator in different positions corresponding to different registering positions of said element; means adapted to support said stops with the interengaging portions thereof in serial alignment with each other and with said

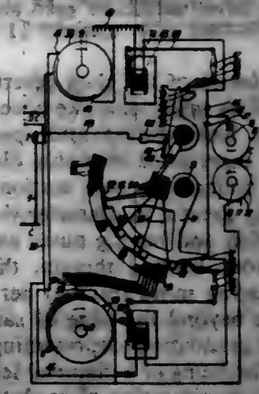
actuator for movement in the direction of advancement of said actuator whereby to engage each other and said actuator. means for limiting said stops for movement through different respective distances only in the direction of movement of said actuator, and means for selectively maintaining one or more of said stops with the engaging portion or portions thereof out of said serial alignment whereby to arrest said actuator in different ones of said positions thereof.

---



2,772,949
**FUEL DURATION COMPUTER**
Le Roy A. Griffith, Minneapolis, Minn., assignor to Minneapolis-Honeywell Regulator Company, Minneapolis, Minn., a corporation of Delaware
Application February 9, 1951, Serial No. 210,258
9 Claims. (Cl. 235—61)

1. Apparatus for determining the length of time a substance will last, comprising, in combination: first means, including first motor means, deriving a first voltage dependent in magnitude upon the quantity of a substance; voltage generating means, connected to said first motor means and operated by said first motor means, deriving a second voltage dependent in magnitude upon the rate of change of the quantity of the substance; voltage comparing means, including second motor means, connected to said first means and said voltage generating means and comparing the first voltage with a portion of the second voltage to control the operation of said second motor means; and means connecting said second motor means to said voltage generating means to control the compared portion of the second voltage, the compared portion being an indication of the length of time the substance would last if the quantity of the substance were to continue to change at the present rate.



2,772,950
**ELECTRONIC DIGITAL COMPUTING MACHINES**
Arthur Alexander Robinson, Sawdburpe, Frederic Calland Williams, Timperley, and Tom Kilburn, Manchester, England, assignors to National Research Development Corporation, London, England, a corporation of Great Britain
Application June 21, 1950, Serial No. 169,386
Claims priority, application Great Britain June 22, 1949
4 Claims. (Cl. 235—61)

1. In an electronic binary digital computing machine operating in the serial mode with number-representing signals in the form of electric pulse signal trains and which comprises a main data storage device for recording both number and instruction-representing signals, an accumulator having an input terminal for applying number-representing signals thereto, a control unit for governing the rhythmic operation of the machine and having an instruction input terminal and an instruction output terminal, an instruction staticisor comprising a plurality of separate sections each operative according to the significance of a different digit of an instruction-representing signal and including a common instruction input terminal and a plurality of separate control potential output terminals and circuit interconnections between the output terminal of said main store and the input terminals of said accumulator and said control unit and between said instruction output terminal of said control unit and said instruction input terminal of said instruction staticisor, said circuit interconnections including a plurality of gate circuit devices controlled by the output potentials of said instruction staticisor, the construction of said accumulator to comprise a cathode ray tube electrostatic storage device including a source of an electron beam, control means controlling the activity of said beam and an insulating storage surface in the path of said beam, a pick-up electrode adjacent to said storage surface and an amplifier having its input terminal connected to said pick-up electrode and having an output terminal, a first computing circuit device having first and second input terminals and an output terminal for performing a chosen first mathematical operation between two input number-representing signals applied respectively to said first and second input terminals and providing a first answer-representing signal at said output terminal, a second computing circuit device having first and second input terminals and an output terminal for performing a second mathematical operation, different from that of said first computing circuit device, between two number-representing signals applied respectively to said first and second input terminals and providing a second answer-representing signal at said output terminal, a first gate circuit having input and output signal terminals and control potential input terminals, a second gate circuit having input and output signal terminals and control potential terminals, circuit means interconnecting the first input terminal of said first and said second computing circuit devices to the output terminal of said amplifier, circuit means connecting the output terminal of said first computing device to the input terminal of said first gate circuit, circuit means connecting the output terminal of said second computing circuit device to the input terminal of said second gate circuit, circuit means connecting the signal output terminals of said first and second gate circuits to said control means of said storage device, circuit connecting means between said control potential terminals of said first and second gate circuits and said control output terminals of said staticisor device whereby said first gate circuit can be opened by one configuration of digits of an instruction representing signal applied to said staticisor device and whereby said second gate circuit can be opened only when another and different configuration of instruction digits is provided in said instruction-representing signal is applied to said staticisor device, a first buffer circuit having input and output terminals, a second buffer circuit having input and output terminals, circuit means connecting the output terminal of said first buffer circuit to the second input terminal of said first computing device, circuit means connecting the output terminal of said second buffer circuit to said second input terminal of said second computing device and circuit means connecting the input terminals of said first and second buffer circuit to the input terminal of said accumulator unit whereby under the control of an instruction signal supplied from said control unit to said staticisor device, a number fed from said main store may be mathematically combined in either of two different ways with a number signal derived from said accumulator storage device and the resultant answer number re-written in said accumulator storage device in the place previously occupied by said derived number.

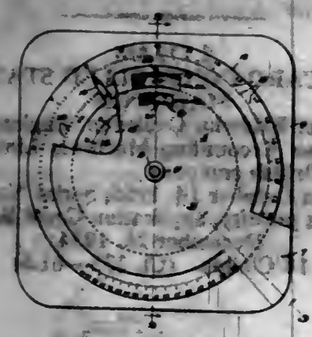
---

2,772,951
**RECORD CARD CONTROLLED STATISTICAL MACHINES**
Richard Everest Baldwin, Coulsdon, England, assignor to Powers-Samas Accounting Machines Limited, London, England, a British company
Application October 14, 1955, Serial No. 540,593
Claims priority, application Great Britain December 24, 1954
18 Claims. (Cl. 235—61.6)

16. Apparatus for decoding data recorded in code by data-indicating indicia in zonal areas of vertical columns of statistical record cards, comprising a sensing device operable to sense a moving card and to transmit electric signals representative of coded data sensed from a card, an electric signal transmitter for each of a predetermined number of characters any one of which may be recorded in code in a card column, a first and a second toothed sector, one for each zonal area of each card column sensed, each sector being supported for angular

movement about a fixed axis to and from a datum position thereof and the axis of the first sector being located above that for the second sector and in the same plane, an arresting element for each sector to arrest the sector appropriate thereto in any one of a predetermined number of positions thereof, a plurality of electric conductor bars disposed to be parallel with the arcuate path in which said second sector is movable, said bars being connected electrically each to a predetermined one of the signal transmitters, a number, equal to the number of predetermined positions for the first sector, of equispaced electrical brushes carried by the second sector each for co-operation with a group of conductor bars of which each group consists of a number of bars corresponding to the number of predetermined positions for the second sector, electric connecting elements carried by the second sector and connected one to each said brush, a movable electric connecting element movable with the first sector for co-operation with one or other of said connecting elements, a first restoring member common to all first sectors, a second restoring member common to all second sectors, said restoring members being angularly movable about the axes about which their respective sectors are angularly movable, and co-operating with the sectors to control angular movement thereof, cam controlled elements to effect operation of the restoring members in timed relation with each other and with movement of a card during sensing thereof, and selectively operable latch elements operable to latch the restoring members against restoring the sectors to the datum positions thereof.

---



2,772,852

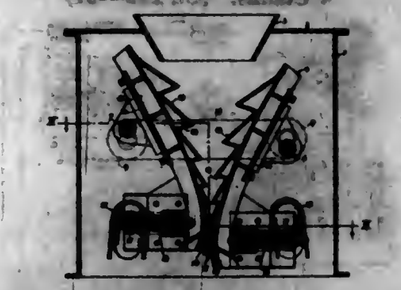
## GASOLINE MILEAGE CALCULATOR

Thomas B. Stadelmaier, Arlington, Va.

Application May 7, 1953, Serial No. 353,686

1 Claim. (Cl. 235—84)

A calculating device of the class described, comprising a base section and an upper disc-like cover section formed integral with the base section and spaced thereabove, upper and lower superposed rotatable discs operating on said base section under said cover section, said lower disc being substantially greater in diameter than the diameter of the cover section and having outer and inner circular lines of graduations formed therein, the outer line of graduations indicating miles traveled per gallon of gasoline, being visible beyond the edge of said cover section, said inner line of graduations representing the miles traveled, said upper disc being of a diameter less than the lower disc and having a circular line of graduations formed on the upper surface thereof indicating the number of gallons of gasoline consumed during travel, said cover section having windows through which such graduations on said upper and lower discs are viewed, an index hand extending from the edge of said upper disc movable therewith and cooperating with the graduations in the outer circular line of graduations on the lower disc indicating miles traveled for each gallon of gasoline consumed, when said discs are moved to predetermined positions under said windows, and means for effecting rotation of said discs.



2,772,853

## GRANULATOR WITH MOVING AND OPPOSED SIFTER MEMBERS CARRYING STEP-SHAPE MATERIAL PRESSERS

Hans Schmidtmann, Boelsum, Germany, assignor, by mesne assignments, to Koppers Company, Inc., Pittsburgh, Pa., a corporation of Delaware

Application January 30, 1952, Serial No. 268,949

6 Claims. (Cl. 241—94)

1. Granulator for redividing lumpy granular material comprising: two confronting granulating members the vis-a-vis faces of which are formed of inverted stairs, each stair comprising a strong crushing ledge and an inclined sifting surface meeting at an acute angle thus presenting ledges increasing closer to the horizontal from feed to discharge to thereby press the material downwardly upon downward sifting surfaces, said inclined surfaces being upwardly and outwardly inclined with respect to a vertical plane passing through the vertex of the hereinafter recited peak sifter, said granulating members being spaced further apart at their upper parts than at their lower parts forming a narrow lower discharge end and being reciprocable about an eccentric axis with an up and down movement in alternation with each other, to cause the smallest particles of the material being granulated to pass through the meshes of the sifting surfaces and escape from the granulating area while the remaining lumpy pieces descend to the lower narrower part of the granulating area and discharge from between the granulating members at the preferred grain size at the lower end of said members; the stairs of each of said confronting faces decreasing in depth toward the lower narrower end of the two members and having the ledges also formed as sifter surfaces, a stationary peaked sifter intermediate the two granulating members at the lower narrower discharge end where the residual material is ground down and is about to be pressed out from the lower discharge end of the granulating member, said peak sifter having downwardly and outwardly inclined sides spaced from curved portions of the two granulating members on opposite sides of the stationary peaked sifter, and having its apex above the lower terminus of the two granulating members in all positions of said members; and means movable upwardly and inwardly and downwardly and outwardly parallel to the sides of said peaked sifter in correspondence with the up and down movement of the two granulating members for yieldably holding the lower ends of the granulating members in a fixed constant spaced relation relative to the sides of the stationary peaked sifter so as to yield to increase the spaced relation under pressure of foreign material.

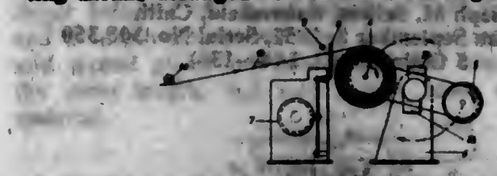
2,772,854

## WINDING DEVICE

Ludwig Herzig, Bobingen, and Friedrich Ilis, Munich, Germany, assignors to Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Bruning, a corporation of Germany



Application December 6, 1950, Serial No. 199,586

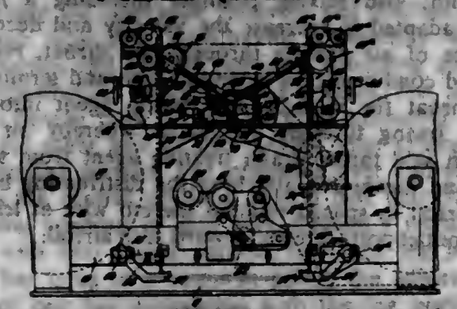
6 Claims. (Cl. 242—18)

1. A non-stop transfer winding apparatus for the continuous coiling of thick tows consisting of substantially parallelly directed, endless synthetic filaments, delivered

at a high rate of speed of more than 500 meters per minute, comprising a bearing frame, a winding drum carrier mounted for rotation in the bearing frame, a pair of winding shafts rotatably mounted in said carrier symmetrical and parallel to the axis of rotation of the drum carrier, means for separately rotating and stopping said shafts, winding drums adapted to be put on the shafts for alternate operation and rotation therewith, rotary cutting means arranged so that their cuttings edges engage

the length of tow freely running between the full drum and the empty drum while the tow in the course of the rotation of the winding drum carrier is still being wound up and held under tension by the full winding drum and in slipping engagement with the empty drum, and adhesion-increasing means on the periphery of each of the drums adapted to permit slipping engagement of the non-severed tow and to take the severed tow end round the empty drum.

---



2,772,855

## CONTINUOUS UNWINDING DEVICE FOR WEBS

Eugene H. Klingelfuss, Brooklyn, N. Y., assignor, by mesne assignments, to American Type Founders Co., Inc., Elizabeth, N. J., a corporation of Delaware

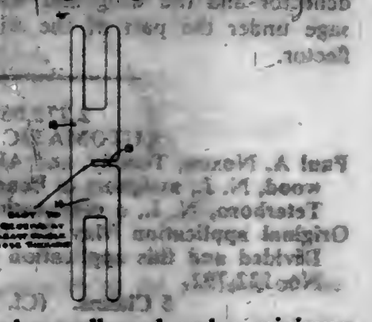
Application December 1, 1953, Serial No. 395,439

6 Claims. (Cl. 242—58)

1. Apparatus for continuously supplying a web of sheet material comprising a primary supply roll of said material, a pair of feed rolls for withdrawing the web from said primary supply roll, adjustable supporting means for one of said feed rolls for accurately positioning said roll with respect to the other roll, said supporting means including eccentric means for quickly moving said rolls apart without changing the position of said supporting means, a secondary supply roll of said material, means on the leading edge of the material on said secondary supply roll to enable said edge to be adhered to the web from said primary supply roll upon contact therewith, normally inoperative feed means for the web from said secondary supply roll, means for rendering said feed means operative, means for guiding the leading edge of said material on said secondary supply roll to the nip of said feed rolls, and means for severing the web from said primary supply roll, whereby passage through the nip of said feed rolls causes the web from said secondary supply roll to be spliced to the web from said primary roll whereupon said latter web may be severed.

---

2,772,856



## HOSE

Donald E. Hamsher and Alan F. Gehringer, Akron, Ohio, assignors to The General Tire & Rubber Company, Akron, Ohio, a corporation of Ohio

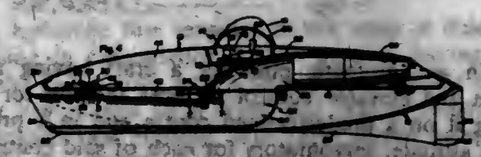
Application December 20, 1950, Serial No. 201,230

3 Claims. (Cl. 245—8)

1. The combination with a reel having a portion adapted for reeling a readily collapsible hose thereabout, of pinching means to prevent flow through the hose beyond any selected point along its length, comprising a straight-sided slot in said reel, said slot having substantially parallel sides and having a depth at least equal to

the width of the hose when collapsed and a minimum width of 75% and a maximum width of 100% of the total thickness of the collapsed hose to be inserted in the slot to maintain the portion of the hose inserted in said slot in the completely collapsed condition.

---



2,772,857

## CIRCULAR AIRCRAFT AND CONTROL SYSTEM THEREFOR

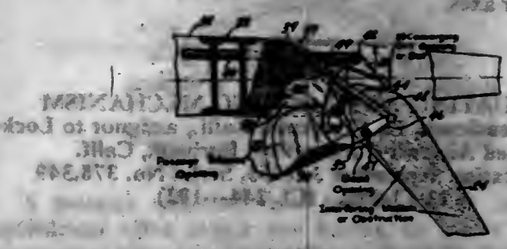
John C. Fischer, Jr., San Diego, Calif.

Application January 29, 1954, Serial No. 406,974

15 Claims. (Cl. 244—15)

1. In an aircraft of generally circular form, a lower portion, an upper portion rotatably adjustably mounted on said lower portion, propulsion means in said upper portion, means for rotating said upper portion to alter the direction of propulsive thrust, and means tending to hold said lower portion against shifting in relation to the direction of motion of the aircraft while said upper portion is rotated.

---



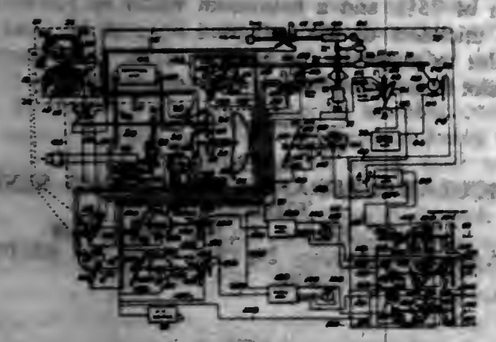
2,772,858

## AIRCRAFT WING WITH MEANS TO INCREASE LIFT THROUGH CONTROL OF AIR FLOW

Charles H. Grant, New Rochelle, N. Y.

Application May 10, 1951, Serial No. 225,609

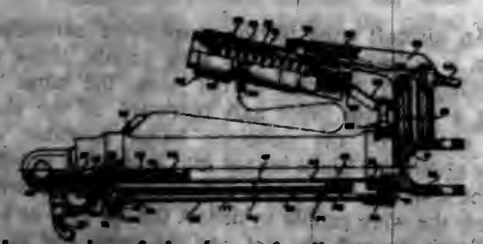
11 Claims. (Cl. 244—42)



1. An aircraft wing having a spanwise extending slot therein, a deflector within the wing profile, hinge means connecting said deflector to the wing, the hinge means having a spanwise pivot axis rearward of the slot, the entire extent of the deflector being movable downwardly about this hinge means into a position in which at least the lower portion of the deflector extends downwardly below the wing profile to deflect the air flow at a point immediately beneath the slot, and the upper end of which is at least as far rearward as the foremost part of the rearward wall of the slot, the hinge means being of substantial length and attached to the deflector at a distance from the pivot axis of the hinge means, and holding the deflector, when in its downward position,

spaced from the bottom surface of the wing whereby a bleed passage is provided through which some of the upwardly deflected air escapes between the top of the deflector and the wing and flows from said bleed passage under the part of the wing rearward of the deflector.

---



2,772,859
AUTOMATIC PILOT
Paul A. Nesen, Tenafly, and Alan M. MacCallum, Maywood, N. J., assignors to Bendix Aviation Corporation, Teterboro, N. J., a corporation of Delaware
Original application May 27, 1944, Serial No. 537,952. Divided and this application October 21, 1949, Serial No. 122,792.
5 Claims. (Cl. 244—77)

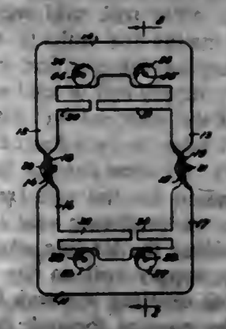
1. In an automatic pilot for a craft having rudder, aileron and elevator control surfaces thereon for maintaining it on a predetermined course and in a predetermined attitude, servomotors for each of said control surfaces, a single and composite master instrument comprising an artificial horizon gyroscope having a normally vertical spin axis and mounted for oscillation about two mutually perpendicular horizontal axes, directional reference means mounted on said gyro and stabilized thereby in a substantially horizontal plane for generating a first signal in response to departure of said craft from said predetermined course for energizing said rudder motor, and bank and pitch responsive means for generating second and third signals in response to departure of said craft from said predetermined attitude for energizing said aileron and elevator motors, said bank responsive means being mounted on one of said mutually perpendicular axes of said gyroscope and said pitch responsive means being mounted on the other of said mutually perpendicular axes.

---

2,772,860
ACTUATING AND LOCKING MECHANISM
Olaf T. Benditsen, La Crescenta, Calif., assignor to Lockheed Aircraft Corporation, Burbank, Calif.
Application September 3, 1953, Serial No. 378,349
13 Claims. (Cl. 244—102)

1. In an aircraft having a landing gear movable between a retracted position and an extended position the combination of; a mechanism connected between the craft and gear operable to move the gear between the retracted and extended positions, the mechanism including two elements, one a cylinder, the other a piston, and means for locking the gear in the extended position comprising a projection on one of said elements, a barrel turnably secured to the other element and turnable into and out of locking engagement with said projection, and means for turning the barrel.

---

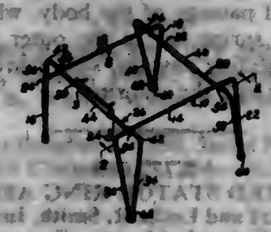


2,772,861
APPARATUS FOR DISSEMINATING INSECTICIDES
Joseph M. Sellers, Bakersfield, Calif.
Application September 8, 1952, Serial No. 308,350
5 Claims. (Cl. 244—136)

1. Apparatus for forming dispersions of fine particles of treating agent in a large volume of air comprising, an airplane provided with a forward propeller and an airfoil disposed rearwardly of such propeller; a mixing chamber having side walls and a forwardly directed open air inlet end; an elongated distributing header extending in a lateral direction with respect to the side walls of the mixing chamber, said distributing header having enclosing walls and closed ends and a plurality of spaced outlet ports in the walls, said distributing header being virtually as long as said airfoil; said distributing header being disposed rearwardly of the mixing chamber and in communication therewith; said mixing chamber including a restricted throat adapted to increase the velocity and decrease the pressure of air passing through said throat; rearwardly directed conduit means extending into and terminating in said throat for introducing treating agent into the air stream owing through the throat whereby air passing through said throat draws treating agent from said conduit; and means for attaching the distributing header to said airfoil in spaced relation thereto with at least some of the outlet ports directed toward such airfoil.

---

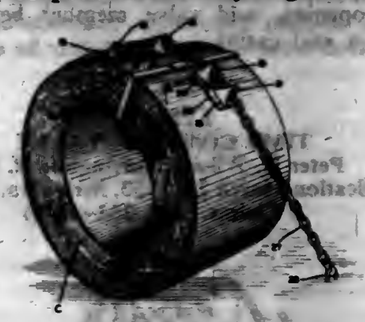
2,772,862
ELECTRIC OUTLET BOX SCREW PLATE
Harley O. Bowser, Rivera, Calif.
Application December 16, 1952, Serial No. 326,285
1 Claim. (Cl. 248—27)



In an electric outlet backing assembly, a first and second U-shaped plate arranged in the same plane and each of said plates including a connecting web, first and second spaced parallel arms extending transversely from one of said webs, third and fourth spaced parallel arms extending transversely from the other of said webs, the free ends of all of said arms being twisted and lying in a plane at right angles to the major portion of said arms, said twisted portions being arranged in aligned relation with respect to each other, said portions being offset from the remaining portion of the arms whereby the arms may bear flat against the supporting structure, pivot pins pivotally connecting together the twisted portions of said arms, each of said webs being provided with a plurality of spaced apart indentations, said indentations having a curved shape, there being a threaded opening in the center of each of said indentations, a first finger extending inwardly from the first arm of said first plate, a second finger extending inwardly from the second arm of said first plate and said second finger being of greater length than said first finger, a third finger extending inwardly from the first arm of said second plate and said third finger being of the same length as said second finger, and a fourth finger extending from the second arm of said second plate, said fourth and first fingers being of the same length, and said fingers being of bendable material.

---

2,772,863
TELEVISION STANDS
William Rosenthal, Syracuse, N. Y., assignor to I. J. Kimm, Syracuse, N. Y.
Application February 12, 1954, Serial No. 409,839
4 Claims. (Cl. 248—163)



1. A stand for television receivers and the like, comprising four rigid bars, each having a generally straight central portion and end leg portions, extending substantially perpendicular to the central portion, one pair of said bars having their central portions extending parallel, and the other pair of bars having their central portions extending parallel, and extending over and at right angles to the central portions of said first pair of bars, said central portions of said bars defining a rectangular support with two raised parallel rails, the leg portion of each bar lying in a common plane, the adjacent leg portion of one bar converging with the leg portion of the adjacent bar at each corner, and the converging portions being secured together at their lower ends, said horizontal portions of said bars being welded together at their four points of contact and intersection, said horizontal portions of said bars each having two offsets equal to one-half the bar diameter, the offsets of one pair of bars being up to one-half the diameter of the bars, and while the offsets of the other pair are down one-half the bar diameter, said offsets of the bars having a nesting relation immediately at the points of contact between the bars at their intersection contacts.

---

2,772,864
HINGE GUARD LOAD PROTECTOR
William T. Cole, Canton, Ohio, assignor to The Canton Manufacturing Company, Canton, Ohio, a corporation of Ohio
Application August 10, 1953, Serial No. 373,173
8 Claims. (Cl. 248—361)

1. A load protector for use in connection with a flexible binding member, said load protector comprising a pair of similar cast malleable iron members, each member having a substantially flat lower surface for contact with a load, a convex upper surface for contact with a flexible binding member and a guide projecting upwardly therefrom for receiving the flexible binding member, and integral cooperating means upon the members hingedly connecting said members together, whereby said load protector may be located at any desired point upon the flexible binding member, and the two hingedly connected members may be positioned at any angle from 90 de-

grees to 180 degrees to conform to the contour of the load.

---

2,772,865
HYDRAULIC FUSES
William W. Thomas, Chicago, Ill., assignor to William Waterman, Evanston, Ill.
Application January 7, 1953, Serial No. 329,980
5 Claims. (Cl. 251—16)

3. A hydraulic fuse sensitive to low rates of fluid flow comprising in combination a fuse housing having inlet and outlet and a valve seat, a valve piston slidable in said housing toward and away from said seat in response to flow through said housing, said valve piston being substantially the weight of the said fluid it displaces and thereby requiring only light forces to hold the same against movement by gravity and inertia forces, a gripper normally applying opposed and balanced gripping forces to said valve piston to hold the same against movement without exerting any unbalanced lateral force thereon, and gripper actuating mechanism responsive only to flow for actuating said gripper to release said valve piston.

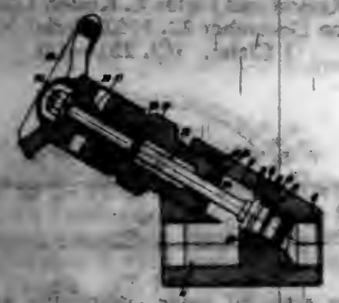
---

2,772,866
PILOT CONTROLLED DIAPHRAGM VALVE
Ralph L. Keeton and Fields E. Kesler, Lubbock, Tex.
Application December 22, 1952, Serial No. 327,302
1 Claim. (Cl. 251—46)

A pressure actuated valve comprising an open sided cylindrical valve casing and having an intake port and an exhaust port, a delivery conduit integrally formed with said casing, said conduit terminating in a delivery opening coaxial with said casing, a cover secured to the open side of said casing, a resilient diaphragm secured over said open side and said delivery opening between said casing and said cover forming a pressure chamber between said diaphragm and said cover, a passageway extending from said intake port through said delivery conduit, said diaphragm and said cover and opening into said pressure chamber, and pressure compensating means for selectively opposing the pressure in said pressure chamber, said pressure compensating means comprising an opening in said casing communicating with said passageway and said open side of the casing, said opening

being positioned below said diaphragm, a rotary valve member having an eccentric surface for selectively closing said opening, said valve member being rotatably mounted in said casing.

---



2,772,067
TIME CONTROL VALVE
Peter H. Wilson, Barrington, R. I.
Application March 23, 1953, Serial No. 343,940
2 Claims. (Cl. 251—240)

1. In a control valve having a conduit through which a fluid may pass from a source of supply, a valve seat along said conduit, a valve plug engaging said seat for controlling the fluid flow, a rockable arm pivoted at one side of the line of movement of said plug and engaging said valve plug to move the same from said seat, a cam rotatable about an axis at right angles to the axis of the rockable arm, a lever pivoted on an axis parallel to the axis of the cam and carrying a cam follower, means to move said lever to cause said follower to engage said cam, said arm having a portion inclined to the path of movement of said follower, said follower also engaging the inclined portion of said rockable arm to actuate the same in response to the movement of said cam.

---

2,772,068
SEAL GUARD
Marvin H. Greve, Piedmont, and Austin U. Bryant, Berkeley, Calif., assignors, by mesne assignments, to Grove Valve and Regulator Company, Oakland, Calif., a corporation of California
Original application May 15, 1948, Serial No. 27,308. Divided and this application October 9, 1951, Serial No. 250,418
1 Claim. (Cl. 251—332)

In a fluid flow control valve, a valve body having flow passages, means forming a valve seat assembly disposed within the body and providing a throat orifice serving to connect said passages, a rigid valve member associated with the seat assembly and movable between open and closed positions with respect to the same, said seat assembly including a seat ring formed to provide an inner cylindrical bore interposed between said valve passages, said ring being removably seated within the body, said valve member having a cylindrical portion slightly smaller than the cylindrical bore of the seat ring and adapted to interfit with the seat ring bore for closed position of the valve and to be withdrawn from one side of the seat ring for open position of the valve, a groove formed in the ring and interrupting the inner periphery of the same, a resilient seal ring of the O-ring type loosely disposed within said groove, a guard ring carried by the body and having one end thereof slidably fitted within said seat, said guard ring forming a part of the seat assembly and being movable between limiting positions in a direction axially of the seat, in one of said limiting positions the guard ring serving to close said groove and retain the seal ring, and in the other position the guard ring being retracted from the O-ring to expose the same for contact with the valve member, one end of said guard ring being adapted to abut the valve member for causing movement of the guard between said two limiting positions as the valve member is moved toward closed position within the seat ring, an outwardly extending flange on the other end of the guard adapted to abut the adjacent end of the seat ring to thereby limit movement of the guard in a direction toward the valve member, and a helicoidal spring aligned with said cylindrical bore and acting between the flange and the body for yieldably urging the guard ring toward said one limiting position of the same, said spring means embracing a substantially unobstructed body space which forms a fluid passage that directly connects the bore with the adjacent fluid passage of the body, whereby the convolutions of the spring are in the outer peripheral portion of said connecting passage, said guard ring being removable together with the seat ring.

2,772,069
SEGMENTED STATOR RING ASSEMBLY
Chester E. Hockert and Leslie R. Smith, Indianapolis, Ind., assignors to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application October 31, 1951, Serial No. 254,143
5 Claims. (Cl. 253—78)

1. A blade ring assembly having a number of arcuate sections each comprising an outer ring segment, an inner ring segment spaced from and coaxial with said outer ring segment and a number of blades fixed in and extending radially between said outer and inner ring segments, adjacent sections of said blade ring assembly having an axially extending peripheral clearance space between their adjacent extremities to facilitate assembly and to permit differential thermal expansion thereof, each of said inner ring segments being of double channel construction with an outer channel member and an inner channel member having superimposed webs and axially spaced radially inwardly directed flanges, the adjacent extremities of adjacent inner ring segments having a tongue and groove connection for both of the said channel members of each of said segments permitting peripherally slidable movement and restraining relative axial movement of said ring sections, each of the said inner ring segments having the said inner channel member at one of the extremities thereof projecting beyond the end of the outer channel member thereof to overlap the said peripheral clearance space between that segment and an adjacent inner ring segment.

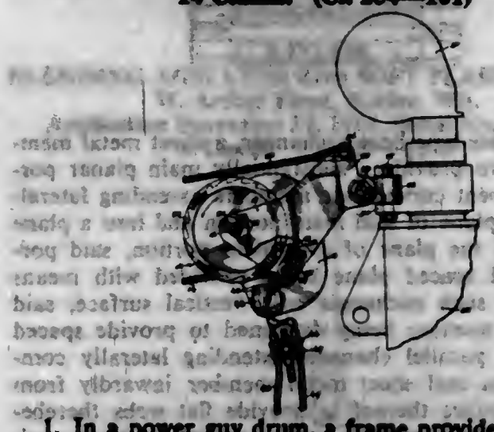
ERRATUM

For Class 153—78 see:
Patent No. 2,771,622

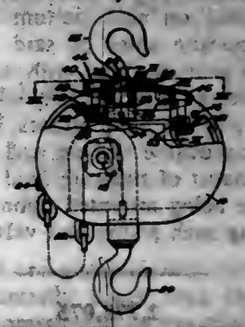


2,772,070
WIRE STRETCHER
John M. Stevenson, near Grapevine, Tex.
Application January 6, 1954, Serial No. 402,569
3 Claims. (Cl. 254—65)

1. An equalizer bar adapted to be held substantially vertical against horizontal tension, a plurality of spring units, each unit having two end pieces and a spring exerting longitudinal tension between said end pieces, one end piece of each unit being connected to holding means mounted upon said equalizer bar, the other end piece of each unit having a wire grip and also having a connection to which a wire stretcher may be attached.

---

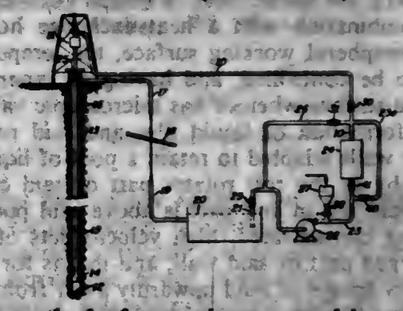
2,772,071
POWER-DRIVEN GUY DRUM
Peter Anderson, Seattle, Wash., assignor to Washington Iron Works Co., Seattle, Wash., a corporation of Washington
Application October 6, 1953, Serial No. 384,440
14 Claims. (Cl. 254—161)



1. In a power guy drum, a frame provided at one end with a fork disposing its slot vertically, an upper and a lower horizontal pin traversing said slot, a link having one end fitted in said slot and receiving a pivot mounting from the lower of said horizontal pins and at its other end providing means for obtaining a vertical pivot mounting, a stationary horizontal shaft carried by said frame at the end of the latter opposite the fork, a drum journaled for rotation on the shaft, a ratchet wheel and a gear wheel made integral with the drum, a dog for said ratchet wheel, a pinion in mesh with said gear wheel for driving the drum, a motor supported by said frame, a pinion direct-driven by the motor, meshing first and second sets of intermediate wheel and pinion reduction gears with the motor-driven pinion in mesh with the gear wheel of the first said intermediate set and with the pinion of the second said intermediate set in mesh with the drum-driving pinion, a frame journal for the several said gears, and means controlled from a point remote to the drum assembly for powering said motor.

---

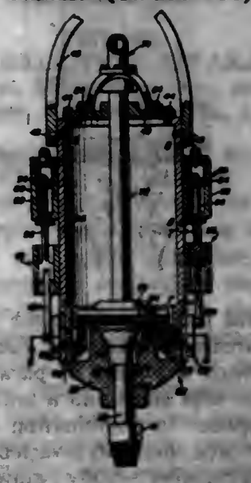
2,772,072
HOIST
Humphrey F. Parker, Buffalo, and Erford E. Robles, North Tonawanda, N. Y., assignors to Columbus McKinnon Chain Corporation, Tonawanda, N. Y.
Application January 4, 1954, Serial No. 401,846
11 Claims. (Cl. 254—167)



1. A hoist construction including a hoist frame and a supension hook for hanging said hoist in operative position, said hoist frame being recessed in its upper surface portion, and a suspension hook bracket device detachably mounted in substantially submerged relation in the recessed portion of said frame, said bracket device having

a central hub portion apertured to accommodate therein the shank portion of said suspension hook and opposed beam portions extending substantially diametrically therefrom for attachment to said hoist frame.

---



2,772,073
HOMOGENIZING OF DRILL MUDS
Everett A. Johnson, Park Ridge, Ill., assignor to Standard Oil Company, Chicago, Ill., a corporation of Indiana
Application March 22, 1952, Serial No. 277,977
2 Claims. (Cl. 255—1.8)

1. The method of preparing an emulsion-type drilling fluid which comprises commingling 60 parts by volume of water saturated with sodium chloride, 40 parts by volume of fuel oil and 8 pounds of commercial lecithin per barrel of total liquid, imparting plastering properties to the resulting fluid mixture by adding 20 pounds of ground limestone per barrel of said fluid, and subjecting the admixture of liquids and ground limestone to homogenizing conditions, whereby a drilling fluid having a zero liquid loss in one hour is prepared.

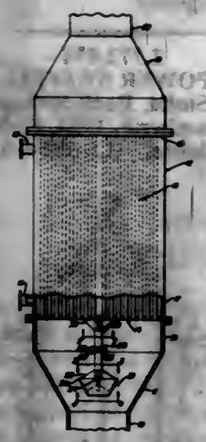
---

2,772,074
POWER SWIVEL
Andrew Stolfa, Rock Springs, Wyo.
Application December 9, 1952, Serial No. 324,927
3 Claims. (Cl. 255—35)

1. A power swivel for oil well derricks comprising a housing having a bottom wall and a suspension means,

a rotatable swivel shaft journaled solely in said bottom wall and depending therefrom and having its lower end provided with a connector for attachment to a kelly, said swivel shaft having a bull gear at the upper end thereof rotatably journaled on said bottom wall, drive shafts journaled on opposite sides of said housing and each having a pinion gear meshing with said bull gear, said bottom wall having a recess providing clearances for said pinions, a pair of fluid motors including cylinders with pistons reciprocable therein and valves controlling the inlet and exhaust of pressure fluid for said cylinders, each fluid motor being mounted upon said housing, and means connecting each piston and valve to a drive shaft.

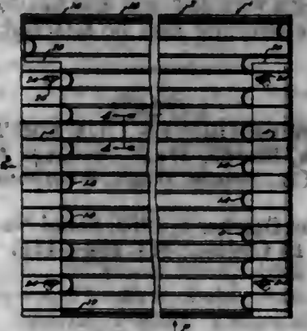
---



2,772,075
**TEMPERATURE CONTROL FOR ROLLERS SUBJECTED TO HEAT**
John J. Mayer, Wood-Ridge, N. J.
Application November 24, 1948, Serial No. 61,789
3 Claims. (Cl. 257—95)

1. In combination with a heat exchange hollow roll having a peripheral working surface, the temperature of which is to be controlled, and having an inner cylindrical wall the surface whereof has microscopic valleys conducive to formation of liquid film and said roll having partial end walls adapted to retain a pool of liquid in the roll, whereby as the roll rotates part of said cylindrical wall is submerged in and part is above said pool, means for injecting concentrated, high velocity jets of fluid on the submerged part of said wall, and means for directing high velocity sprays of fluid upwardly away from the pool for dispersing film on a part of said wall above said pool.

---

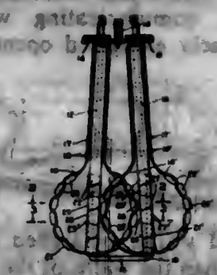


2,772,076
**CATALYST FLOW DISPERSION DEVICE**
John R. Matthews, Chicago, Ill., assignor to Standard Oil Company, Chicago, Ill., a corporation of Indiana
Application October 16, 1953, Serial No. 386,520
6 Claims. (Cl. 257—224)

1. An apparatus for controlling the upward flow of a heterogeneous stream of gasiform fluids and finely divided solids through a bundle of parallel vertical tubes between an upper tube sheet and a lower tube sheet in a shell which comprises in combination a depending skirt below said lower tube sheet, an inverted hollow truncated conical deflecting member wholly below said skirt, a centrally located depending mast means fixed to the lower tube sheet of said bundle, an inverted spearhead cone carried by the lower end of said mast, and a plurality of radially extending spacer plates fixed to the interior of said conical member and to said mast, the base of said spear-head cone and the base of said truncated conical member being in horizontal alignment and the surfaces thereof being parallel.

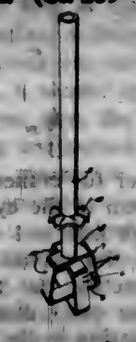
---

2,772,077
**TUBE ENVELOPING PLATE CONDENSER HAVING ROLLED ENDS, AND METHOD OF ITS CONSTRUCTION**
Thomas H. Poland, Dowagiac, Mich., assignor to Rudy Manufacturing Company, Dowagiac, Mich., a corporation of Michigan
Application March 15, 1951, Serial No. 215,822
3 Claims. (Cl. 257—256)



1. In a plate-type heat exchanger, a sheet metal member formed to provide a substantially main planar portion, and rebent curved side members extending laterally from the plane of said main portion and into a plane spaced from the plane of said main portion, said portions in said spaced plane being provided with means for securing such exchanger to a vertical surface, said sheet metal member being deformed to provide spaced substantially parallel channels extending laterally completely across said sheet metal member inwardly from the outer surface thereof to provide flat webs therebetween, an endless conduit having spaced portions positioned within said channels and U-shaped portions connecting said spaced portions and positioned in spaced relation to said sheet metal member in said spaced plane, the interior walls of said channels engaging the walls of said spaced conduit portions and being formed thereabout to present a smooth outer surface to said exchanger.

3. The method of making a tube and plate heat exchanger from a length of conduit and a section of substantially flat sheet metal which comprises the steps of: forming spaced trough means in said sheet metal section extending completely across one dimension thereof while maintaining flat webs disposed between the trough means and keeping said webs in a common plane, forming said conduit to have straight portions joined by end loop portions, placing the straight portions of said formed conduit in said trough means with the end loop portions extending therebeyond, of supporting the walls of said trough means against movement outwardly away from each other, confining the webs at the ends of said walls against movement out of said plane, and applying a force to said troughs to move the bottom of the trough means toward the plane of said webs and thereby collapse the walls of the trough means inwardly to cause the inner portions thereof to wrap around the periphery of the straight portion of the conduit, and limiting the movement of the outer portions of said trough walls to said plane to thereby provide a substantially continuous flat surface to one side of said exchanger.

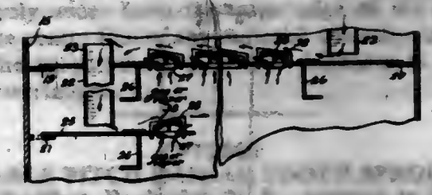


2,772,078
**BEATER BLADES**
Stephen Ellis, Newark, N. J., assignor of one-half to Adolph E. Ellis, Newark, N. J.
Application March 9, 1954, Serial No. 414,986
4 Claims. (Cl. 259—131)

1. A beater of the character described, comprising a frame defined by a crosshead and a pair of converging rods, a beater unit rotatably mounted on each of said rods, each unit comprising a pair of blades, the blades of each unit having rounded ends adjacent the crosshead of said frame, the rounded ends of each blade having offset paddle portions, adjacent paddle portions of each blade being offset in opposed directions, and the paddle portions of one blade in each unit being offset in an opposed direction to corresponding horizontally alined paddle portions of the other blades of said units.

---

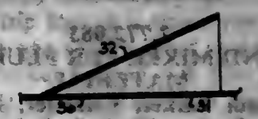
2,772,079
**BLENDING AGITATOR FOR SOFT PLASTIC FOODS**
W. Arthur Ernst, Racine, Wis.
Application December 29, 1953, Serial No. 400,878
1 Claim. (Cl. 259—134)



An agitator for a beverage mixer, said agitator comprising a spindle provided intermediate its ends with a fluid intercepting disk having radial convolutions and an agitator head mounted on the spindle below said disk and comprising a pair of endless straps each in the form of a figure having a closed perimeter and being entirely open within said perimeter, said straps crossing each other at right angles and having substantially flat and approximately parallel top and bottom portions and radially divergent blending portions, the said top portion being spaced below said disk and the said blending portions each being approximately tangential in a horizontal section through said head to a circle drawn about the projected axis of the spindle.

---

2,772,080
**GAS-LIQUID CONTACT APPARATUS**
Clifford A. Huggins and Gethin C. Thrift, Wichita, Kans., assignors to Koch Engineering Company, Inc., Wichita, Kans., a corporation of Kansas
Application March 8, 1954, Serial No. 414,578
9 Claims. (Cl. 261—114)

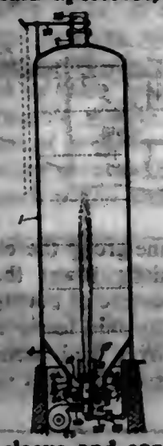


5. A contact device comprising a plate provided with a plurality of groups of perforations, loose covers for said perforations liftable therefrom by fluid pressure exerted from beneath said plate, and means for limiting the upward movement of said covers, the covers and perforations of each group being arranged uniformly across a predetermined area in said tray, all the covers of one group being of substantially greater weight per unit area of the corresponding perforation than the covers of another group, the resistance to lifting by said fluid pressure

of the covers of said one group thereby being substantially uniform but substantially lower than the resistance to lifting by said fluid pressure of covers of said other group, whereby covers offering said lower resistance will permit substantial bubbling over said predetermined area even though the liquid pressure head is not uniform over said area.

---

2,772,081
**VAPOR-LIQUID CONTACTING APPARATUS**
Henry J. Hibshman, Plainfield, and James J. Trexel, Roselle, N. J., assignors to Esso Research and Engineering Company, a corporation of Delaware
Application March 6, 1951, Serial No. 214,076
1 Claim. (Cl. 261—114)

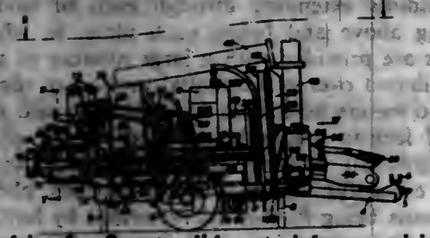


Apparatus particularly adapted for fractionation comprising a vertical tower containing a plurality of horizontally disposed vertically spaced plates extending substantially across the tower intersecting vertically positioned conduits extending through each of said plates terminating above and below each plate, in which the said plates are provided with a large number of perforations distributed over a substantial portion of their area, and lean-to means associated with each of said perforations, said lean-to means being fixed to said plate and inclined upwardly towards the said conduit associated with and extending downwardly from each plate, said lean-to means being further characterized by having side closure members joined to said lean-to means and extending downwardly to the said plate adjacent to the perforation provided in the plate, said lean-to means being still further characterized in that the lean-to member covers a substantially greater area than the area of the corresponding perforation.

---

2,772,082
**STRESS RELIEVING APPARATUS**
Richard M. Hoetvet, Milwaukee, Wis., assignor to A. O. Smith Corporation, Milwaukee, Wis., a corporation of New York
Application July 27, 1950, Serial No. 176,104
2 Claims. (Cl. 263—6)

1. Apparatus for relieving stresses of fabrication in large pressure vessels which have been erected in their intended place of use, which comprises a metal plate adapted to be removably secured to the lower end of the vessel, a cylindrical sheet metal sleeve secured to said plate and extending upwardly through an opening in the plate, a second cylindrical sheet metal sleeve concentric with the first sleeve and encompassing a substantial portion of the latter, said second sleeve being adaptable for vertical movement with respect to said first sleeve, means secured to said second sleeve and extending downwardly through said plate to effect vertical movement of the second sleeve, a generally cylindrical fire



box secured to the inner surface of said first sleeve, a plurality of circumferentially spaced apertures in said plate adjacent said first sleeve, rotatable means disposed above said plate and adapted to control the amount of air passing through said apertures, a burner removably

secured to said first sleeve and connecting with said fire box, a source of gas supply and a source of air supply and means to deliver said gas and air through said burner and fire box into the interior of the vessel where combustion is effected and the heat therefrom raises the temperature of the metal of the vessel being treated.

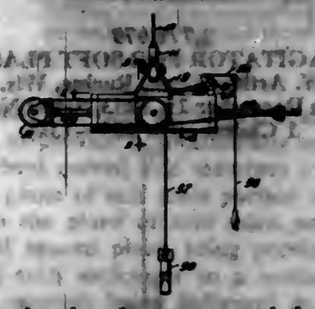
---

**2,772,083**
**DRIER AND MIXER FOR FLUENT SOLID MATERIAL**
Frederick William Parker, Leicester, England, assignor to Frederick Parker Limited, Leicester, England, a British company
Application March 10, 1954, Serial No. 415,330
Claims priority, application Great Britain March 10, 1953
15 Claims. (Cl. 263—33)

1. A drier for fluent solid material, comprising a drum of hollow elongated form mounted, in use, on a support for rotation about an axis inclined to the horizontal, annular feed means secured around said drum at its higher end and rotatable therewith to feed solid material into the drum interior, said feed means extending over a portion of said drum and having a plurality of chutes therein, apertures in said portion of the drum connecting the chutes with the interior of the drum, annular delivery means secured around the lower end of the drum and rotatable therewith to deliver dried solid material, a discharge device carried by said support and projecting into said delivery means to receive material from said delivery means and burner means carried by said support adjacent said delivery means for injecting hot drying gas through said drum from its lower end in counterflow to descending solid material.

---

**2,772,084**
**HEATING FURNACE**
Luther T. Pearsall, Pittsburgh, Pa., assignor to Jones & Laughlin Steel Corporation, Pittsburgh, Pa., a corporation of Pennsylvania
Application June 7, 1952, Serial No. 292,235
6 Claims. (Cl. 263—40)



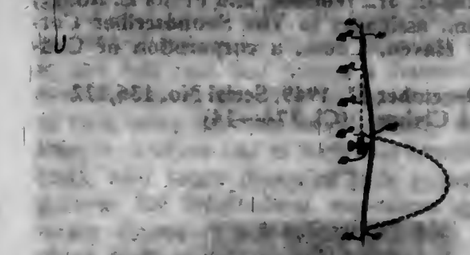
1. A heating furnace for billets or the like comprising a hearth, side walls and end walls, one end wall being provided with a charging opening, and the other end wall being provided with fuel burners positioned to direct heating flames toward the charging opening, a roof inclined downwardly toward the charging opening, an elongated waste gas off-take chamber extending transversely across the furnace above the roof thereof adjacent the charging opening, communicating with the furnace through a transversely elongated opening, said chamber

having parallel end walls, an arched roof with a span materially greater than the width of the transversely elongated opening, and side walls converging smoothly from the base of said arched roof to the transversely elongated opening, enclosing thereby a volume materially greater than that of the portion of the furnace directly below the transversely elongated opening, and a flue communicating with the waste gas off-take chamber through a wall thereof.

---

**2,772,085**
**SHOCK ABSORBER**
Adiel Y. Dodge, Rockford, Ill.
Application September 7, 1954, Serial No. 454,361
3 Claims. (Cl. 267—1)

1. A shock absorber for cranes and the like comprising a cylinder, a piston in the cylinder having a piston rod extending through one end of the cylinder, means to seal the piston in the cylinder against flow of fluid therepast in one direction but to allow flow of fluid past the piston in the other direction, a spring urging the piston in one direction in the cylinder, a second piston in the cylinder having a piston rod extending through the other end of the cylinder, means to seal the second piston in the cylinder against flow of fluid therepast in one direction but to allow flow of fluid therepast in the opposite direction, means providing a restricted orifice through the second piston, a bypass connection around the first named piston, a restricted orifice in said bypass connection, a shut-off valve in the bypass connection, and means to connect the piston rods to a load, the second piston being held against movement in the cylinder by fluid trapped therein when the shut-off valve is closed and gradually yielding by flow of fluid through the orifice when the shut-off valve is open, the sealing means on the first piston allowing flow therepast when the piston moves in response to the load and the sealing means for the second piston sealing to prevent movement of the second piston in response to the load.



---

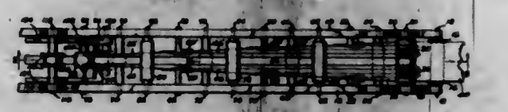
**2,772,086**
**CONTROLLED GRADIENT COMPRESSION LEAF SPRING**
Edwin E. Foster, Austin, Tex., assignor to Magic-Ironers, Inc., Austin, Tex., a corporation of Texas
Application May 3, 1954, Serial No. 426,992
3 Claims. (Cl. 267—1)

1. A controlled gradient compression spring comprising a strip of spring material, ends on the strip through

which a compressive load is applied to move the ends of the strip relatively toward each other, the strip being normally bowed in one direction in its relaxed condition,

and means to hold the strip bowed in the opposite direction so that the strip will be bowed further in the opposite direction as its ends are moved toward each other in response to an applied compressive load.

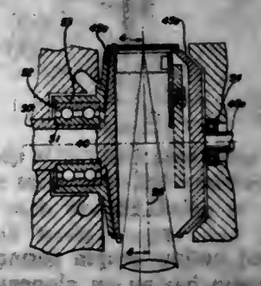
---



**2,772,087**
**CLOSURE OPERATOR**
John L. Hutchinson, Wheaton, Ill.
Application October 17, 1952, Serial No. 315,257
10 Claims. (Cl. 268—72)

1. The combination with a closure for moving the closure relative to a surface substantially normal thereto of a first lever arm having one end thereof pivotally attached to said closure, a second lever arm pivotally attached to said first lever arm, the opposite end of said second lever arm being unattached and adapted for contact with said surface, means for normally urging said arms into a contracted position, means for preventing said arms from assuming a completely collapsed position, means associated with said surface for limiting the travel of the unattached end of said second lever arm, and means upon which a force may be applied at the point of pivot between said arms to separate said arms.

---



**2,772,088**
**STRAP FORMING APPARATUS**
Victor A. Nelson, Portland, Oreg.
Application July 18, 1955, Serial No. 522,563
4 Claims. (Cl. 270—93)

1. Apparatus for folding a continuous strip of flexible material, comprising, an elongated frame extending substantially in a straight line and having an infeed end and an outfeed end, scoring roll means adjacent the infeed end of the frame for scoring the flexible material longitudinally along laterally spaced lines arranged on opposite sides of the center line of the material, whereby to form elongated sections of said material arranged in pairs on opposite sides of said center line, a plurality of bending means mounted on the frame and spaced progressively from the outfeed side of the scoring roll means toward the outfeed side of the frame, each progressive bending means functioning to bend each progressively inwardly spaced pair of elongated sections of said material along the associated scoring lines, and folding means mounted on the frame adjacent the outfeed side of each bending means for folding the associated bent sections adjacent the next inward pair of sections, the scoring roll means being proportioned and arranged in such manner that the score lines of each of the respective pairs of scorings are made progressively wider from the outer edge of the material toward the center line of the material whereby to accommodate the progressively increased thickness as the sections are overlapped.

---

**2,772,089**
**VARIABLE PITCH RADIAL TOOTH SPROCKET**
John G. Streiffert, Rochester, N. Y., assignor to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey
Application May 1, 1952, Serial No. 285,501
4 Claims. (Cl. 271—2.3)

1. A variable-pitch film feeding sprocket assembly for use with a film strip having a single row of perforations arranged adjacent one edge thereof comprising in combination, a thin sprocket formed with film propelling teeth, each tooth having a flat planar film driving face which lies on a radius of said sprocket, means for supporting and rotating said sprocket, a thin film supporting member positioned on one side of said sprocket, and a thicker film supporting member positioned on the other side of said sprocket and cooperating with said first member to support said film adjacent and on opposite sides of said sprocket, said members being of equal diameter but slightly larger than the base diameter of said sprocket and arranged concentrically relative to each other but eccentricaly relative to said sprocket in the direction of the feed-on side of said sprocket.

---

**2,772,090**
**LIGHTWEIGHT GRIP**
Thomas O. Brandon, Longmeadow, Mass., assignor to A. G. Spalding & Bros., Inc., Chicopee, Mass., a corporation of Delaware
Application August 27, 1952, Serial No. 306,708
2 Claims. (Cl. 273—81)

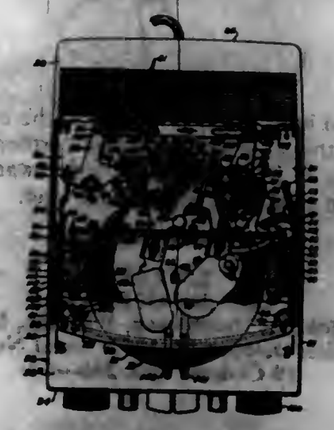
1. A lightweight grip for a golf club shaft comprising a grip member of molded rubber composition adapted to surround the end of said shaft and being of decreasing thickness from the end of the shaft and having spaced, broad, integral, shaft-engaging ribs on the inner surface

forming shallow grooves therebetween and extending longitudinally of the shaft from the end of the shaft for a major part of the length of the grip and decreasing in depth from said end, the walls of the grip member overlying the grooves being substantially uniform and sufficiently thick and the rubber composition being sufficiently firm as to prevent depression thereof into the grooves and to resist torsional distortion in use whereby a satisfactory uniform gripping surface is provided.

---

2,772,091
TENPINS
Arthur A. Harris, Oak Ridge, Tenn.
Application March 7, 1952, Serial No. 275,352
5 Claims. (Cl. 273—82)

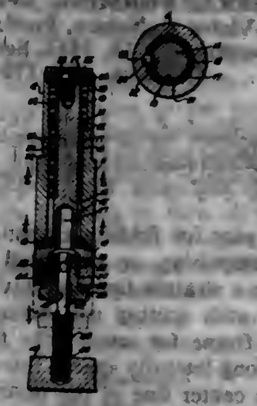
1. A completed hollow tenpin formed of lightweight material, said tenpin having an elongated neck or head portion, and a body portion of enlarged cross-section compared to that of said neck portion integrally united to said neck portion, said body portion having a flat base, and at least an appreciable section of said body portion along the length thereof being of openwork construction around the entire periphery of said body portion, and tenpin having a total weight not greater than approximately one-fourth that of a conventional tenpin.



---

2,772,092
BULLET TRAPS
Joseph Nikodem, Birmingham, Mich.
Application February 17, 1954, Serial No. 410,827
1 Claim. (Cl. 273—102.4)

A bullet trap comprising peripheral deflector plates at the two sides and the bottom of a target area disposed at suitable angles to deflect bullets fired thereagainst to the rear of the target area, a back plate at the rear of the target area connected to side deflector plates, the upper portion of said back plate extending between the two side deflector plates defining the top of said target area and providing a canopy thereover disposed at a suitable angle to deflect bullets fired thereagainst downwardly along said back plate to a bullet spending chamber, elements forming a bullet spending chamber having one live bullet opening adjacent the lower end of said back plate, a second forwardly disposed live bullet opening and a spent bullet outlet at the bottom thereof, a plurality of spaced deflector elements in said target area having a knife-like front edge and disposed to deflect bullets entering the target area to said back plate and therealong to said bullet spending chamber, the lowermost deflector element and the lower deflector plate converging to direct live bullets into the forwardly disposed live bullet opening of the bullet spending chamber, each said spaced deflector element including a splatter trap formed therecross presenting a smooth pass for bullets entering the target area.

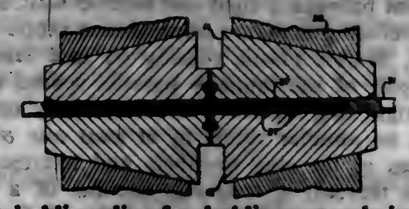


2,772,093
RECORDING AND PLAYBACK ARM OPERATING AND SETTING MEANS FOR DICTATING MACHINES
Anthony C. De Napoli, Jr., Windsor, and Frank E. Runge, Branford, Conn., assignors to The Soundscriber Corporation, New Haven, Conn., a corporation of Connecticut
Application December 31, 1949, Serial No. 136,222
26 Claims. (Cl. 274—14)

1. In a dictating machine, means comprising a swingable recording arm for forming a spiral sound track starting in a predetermined outer zone of a disk record member, means for playing back the recorded spiral sound track comprising a swingable playback arm, power drive means comprising friction couplings for moving said recording arm and said playback arm at identical speeds in opposite directions inwardly across said record member away from said outer zone, mechanism for simultaneously retracting said recording arm and said playback arm to said outer zone against the frictional force of said couplings, comprising a manually actuatable operating member accessible at the exterior of the machine said member also forming a cover for said machine, and a lever and linkage device operatively connecting said operating member to said recording arm and to said playback arm.

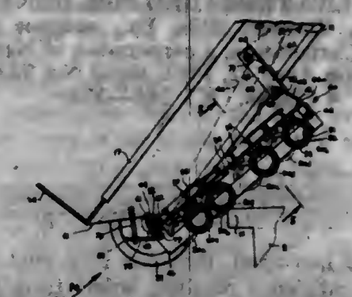
---

2,772,094
TOOL HOLDERS
Vincent S. Jamilkowski, East Hartford, and Ross Walter Swanson, West Hartford, Conn.
Application January 19, 1954, Serial No. 404,862
2 Claims. (Cl. 279—16)



1. A tool holder comprising a housing, a chuck body movable longitudinally within said housing, a tubular ball cage positioned between said housing and said chuck body, said cage being movable longitudinally relative to either and to both said housing and said chuck body, a first plurality of balls of a substantially uniform size mounted in said ball cage and positioned to roll simultaneously on the inner periphery of said housing and on the outer periphery of said chuck body, said first balls being arrayed through a transverse arc of more than 180°, a longitudinal groove in the inner periphery of said housing, a longitudinal groove in the outer periphery of said chuck body and positioned opposite said first mentioned groove, a second plurality of balls mounted in said ball cage and having a diameter larger than the first mentioned plurality of balls, said second plurality of balls being movable longitudinally with said ball cage relative to either and to both said housing and said chuck body, said larger diameter balls engaging both of said grooves for longitudinal movement only therein, said larger diameter balls preventing the rotation of said chuck body relative to said housing.

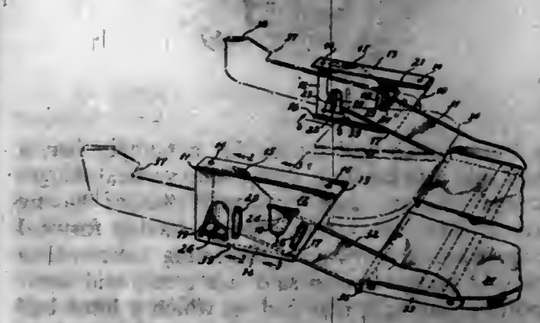
---



2,772,095
OFFSET GRIP FOR SPLIT DIES AND METHOD OF MAKING SAME
William A. Barnes, Utica, N. Y., assignor to Utica Drop Forge & Tool Corporation, a corporation of New York
Application June 30, 1953, Serial No. 365,150
4 Claims. (Cl. 279—57)

4. Split holding dies for holding a workpiece therein against severe longitudinal forces tending to move the workpiece through the dies, comprising, a plurality of die members having die surfaces cooperating to define a workpiece holding area and said die members being laterally compressible upon a workpiece in said area, said die members having a working alignment position, said die members being relatively shiftable to a staggered relative position, said die surfaces having symmetrical lateral grooves along said work piece holding area while in said staggered relative position, said lateral grooves having land areas therebetween, said land areas being located opposite groove areas while said die members are in said working alignment position.

---



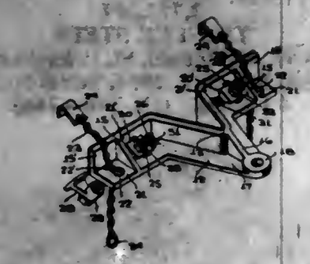
2,772,096
APPLIANCE HAND TRUCK PROVIDED WITH STAIR-CLIMBING ATTACHMENT
Alfred H. Hanson, Garrison, N. Y., assignor to The Fairbanks Company, New York, N. Y., a corporation of New Jersey
Application June 15, 1953, Serial No. 361,485
11 Claims. (Cl. 280—5.24)

1. In an appliance hand truck, a roller unit comprising a housing, a plurality of rollers mounted in said housing in a plurality of rows with the rollers of each row staggered with adjacent rollers of the adjacent row, each of said rollers having a frictional outer circumferential surface, and resilient mounting means for each roller effective to permit limited longitudinal movement of one roller relative to the others and to return said roller to its original position, and means to raise the bottom surface of each roller above the bottom surface of the others when said roller is moved longitudinally.

---

2,772,097
TRAILER STEPS
Albert W. McDonald, St. Petersburg, Fla.
Application March 2, 1954, Serial No. 413,574
4 Claims. (Cl. 280—166)

1. A trailer step structure comprising a pair of brackets adapted to be secured to the underside of a trailer in spaced relation, each bracket being of channel form in cross section and having upper and lower horizontal flanges and a vertical web connecting the flanges, each web having a lug struck out from the plane thereof, each lug including a vertical section in a plane spaced inwardly and parallel to said web, the vertical section being connected at the top to said web by a horizontal section, a sheet metal arm slideably mounted between each web and the vertical section of each lug, the upper edge of each arm having a shoulder formed therein and an elongated bearing surface spaced rearwardly thereof, said shoulder being arranged to engage the horizontal section of its associated lug and the bearing surface being arranged to engage the upper flange of its associated bracket when the arms are extended outwardly, and a step tread secured to said arms.

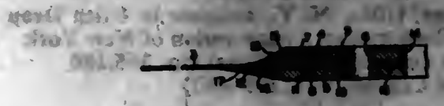


---

2,772,098
TRAILER HITCH WITH STABILIZER DEVICE
Ralph B. Seeley, Burbank, Calif.
Application February 17, 1954, Serial No. 410,753
11 Claims. (Cl. 280—406)

1. A stabilizing trailer hitch for connection between a spring-supported frame of a towing vehicle and a trailer, comprising: a coupling member secured to the vehicle, rearwardly of its rear axle, and having a ball engageable by a socket at the front end of the trailer to connect the trailer to the vehicle for relative lateral and vertical pivotal movement; a first bearing bracket carried by the spring-supported frame of the vehicle forwardly of the rear axle; a second bearing bracket carried by the trailer frame adjacent its front end; a stabilizer bar having resilient forward and rearward ends engageable respectively with said first and second bearing brackets, an intermediate portion of said bar being disposed beneath said coupling member, said rearward end of the stabilizer bar being pivotally connected to said intermediate portion on a vertical axis aligned with said ball; interengaging means on said coupling member and said bar for retaining the bar longitudinally in place; and means engageable between said coupling member and said stabilizer bar and providing a vertical spacer therebetween.

2,772,099
**BUMPER MOUNTS FOR TRAILER HITCHES**
Arthur F. Smith, Trenton, N. J.
Application February 19, 1954, Serial No. 411,298
2 Claims. (Cl. 280—502)



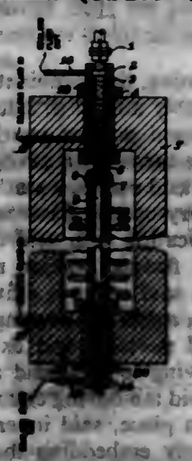
1. In a trailer hitch ball mount for a bumper bar, a body having side arm portions comprising vertical flanges and horizontal flanges, said horizontal flanges having upper surfaces and said vertical flanges having forward and rear surfaces, a rearwardly projecting intermediate portion on said body between said side arms, said intermediate portion having a rear end on which a hitch ball is adapted to be secured, said horizontal flanges having keyhole slots therein comprising forward narrow slot portions and rearward larger portions, a plain slot in said body extending into a horizontal flange and a vertical flange, a bearing block having a lower surface and an upper surface, said bearing block being wider than said plain slot and having its lower surface bearing upon the upper surface of the horizontal flange and the rear surface of the vertical flange, a bolt having a shank traversing said block and extending through said plain slot, said bolt shank having a lower end having a head below said body and an upper end above said block, a hook element sleeved on the lower end of the shank for engaging the lower edge of a bumper bar, a nut on the upper end of the shank engaging the upper surface of the bearing block, chains having upper ends and lower ends, hook elements on the upper ends of the chains for engaging over the upper edge of a bumper bar, said chains depending through said keyhole slots with their lower ends below said body, and rings on the lower ends of the chains wider than the keyhole slots, said rearward larger portions of the keyhole slots being sufficiently large to freely pass the chains, the chains being adjustable and securably engaged in the narrow forward portions of the keyhole slots.

2,772,100
**PIPE END CONNECTION AND SEALING SYSTEM WITH CENTERING MEANS**
Ernst Kretzig, Krefeld-Uerdingen, and Oskar Erich Peter, Oberhochen, Germany
Application January 15, 1953, Serial No. 331,414
1 Claim. (Cl. 285—93)

In combination, a pair of end-to-end pipe ends, each of said pipe ends being chamfered around its outer terminal edge, and a union releasably sealing the joint between said pipe ends, comprising a ring having a cylindrical bore extending in a closed circle around and between the adjacent pipe ends and having an annular groove around the mid-portion of the bore, a resilient snap ring in said groove for positioning the union on the pipe ends, the groove being indented to a depth not substantially exceeding the thickness of the snap ring measured in the direction of said depth, said snap ring being expansible out of the bore into the groove, and when not flexed having the average of its inner end outer diameters substantially equal to the diameter of said bore, so that the snap ring resiliently enters the annular groove formed by the opposed chamfered ends of the pipe ends when the snap ring is moved to the last-mentioned groove, and is cammed out of the last-mentioned groove by the chamfer on one of the pipe ends when the union is shifted axially along one of the pipe ends, and means for releasably sealing the opposite ends of the first-mentioned ring around the respective pipe ends.

2,772,101
**FITTING FOR FLEXIBLE WALL TANK**
Herbert D. Smith, Akron, Ohio, assignor to The Goodyear Tire & Rubber Company, Akron, Ohio, a corporation of Ohio
Application February 3, 1954, Serial No. 407,911
4 Claims. (Cl. 285—200)

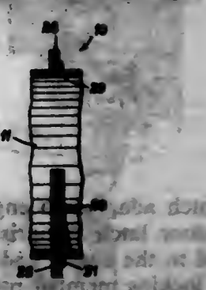
1. A joint between a rigid and flexible wall, said flexible wall including a plastic impregnated fabric part and a resilient, flexible plastic coating on said fabric, comprising a pair of substantially parallel spaced apart coextensive rigid ring members of substantially equal outer diameters; an annular recess in at least one of the opposing faces of the ring members and intermediate the peripheries thereof; a retaining annulus of a diameter corresponding to that of said recess, the fabric part having an opening therein of less diameter than said retaining annulus with the inner periphery folded back on itself around said retaining annulus and extending at least to the outer periphery of said ring members, the retaining annulus and the portion of the fabric thereabout arranged in said recess in firm engagement therewith to positively position the fabric with respect to the rigid ring members; resilient, flexible plastic material between the rigid ring members in the space not occupied by the fabric and retaining ring to maintain the opposed faces of the rigid ring members in substantially parallel relation; and resilient, flexible plastic material bonded to the outer periphery of at least one of said rigid rings and in sealing relationship with the edge of the folded back fabric portion, said plastic material being bonded to said fabric and extending outwardly from the outer periphery of the rigid ring member, the thickness of said material decreasing as the distance from the rigid ring member increases to provide a graduated increase in the flexibility of the flexible wall.



2,772,102
**SEALED THREADED PIPE JOINT**
Samuel Webb, Pleasant Hills, Pa., assignor to United States Steel Corporation, a corporation of New Jersey
Application April 22, 1952, Serial No. 283,535
4 Claims. (Cl. 285—334)

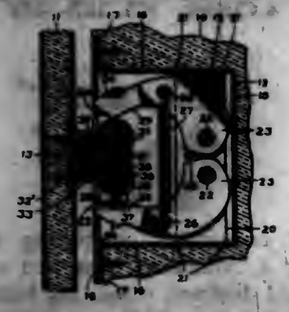
1. A tapered non-upset, threaded pipe joint characterized by 100% efficiency resulting solely from the screw-threaded contact, said joint comprising an internally threaded coupling member and an externally threaded pipe end member, the threads on each member having load-bearing and nonload-bearing flanks when tensile stresses are applied to the joint, the combination of the pipe and coupling threads being substantially complementary and having flat crests and roots, the threads being narrower than the thread grooves, the load-bearing flanks of the pipe and coupling threads being substantially normal to the longitudinal axis of the pipe and coupling, the roots and crests of the coupling threads being parallel throughout the length thereof and the roots of the pipe threads being parallel throughout the length of the pipe threads providing a plurality of fully formed threads with vanishing threads at the junction with the unthreaded portion of the pipe, the crests of the coupling threads being parallel to the roots of the pipe threads and the roots of the coupling threads being parallel to the crests of the fully formed pipe threads, the mating threads on the coupling being at least as long as the total length of fully formed and vanishing threads on the pipe, the entire surface of the flat crests of the coupling threads being in engagement with the roots of the pipe threads throughout the full length of the fully formed and vanishing pipe threads, the entire surface of the flat crests of the pipe threads being in engagement with roots of the coupling threads throughout the full length of the fully formed threads on the pipe, and the threads of said joint having a difference in phase whereby a load-bearing flank of the pipe threads is in sealing engagement with a load-bearing flank of the coupling threads and a nonload-bearing flank of the pipe threads is in sealing engagement with a nonload-bearing flank of the coupling threads at points spaced apart a distance greater than the width of a fully formed thread but within the length of the fully formed threads.

2,772,103
**ROTARY SHAFT SEAL AND PRESSURE REGULATOR**
René A. Straub, Charleston, W. Va., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
Application December 2, 1952, Serial No. 323,632
2 Claims. (Cl. 286—9)



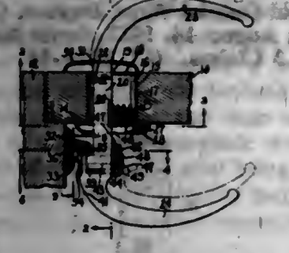
1. A bearing seal for rotary shafts which comprises a substantially inflexible shaft which fits in rotating relationship into the bore of a substantially inflexible bushing constituting a bearing surface for said shaft, said bushing piercing the wall of a pressure vessel and being in a fixed relationship thereto, the high pressure end of said bushing being at the inside surface of said vessel and the low pressure end of said bushing being at the outside surface of said vessel, a radial clearance between said bushing and said shaft extending for an axial length of 4 to 15 times the diameter of said shaft, the diameter of said bore being from 0.0006 inch to 0.0030 inch larger than the diameter of said shaft, a means for introducing sealing fluid at any desirable pressure into said radial clearance at a position approximately one-third of said axial length from said high pressure end of said bushing, a means for withdrawing said sealing fluid from said low pressure end of said bushing, and means for cooling the surface of said shaft and the surface of said bore defining said radial clearance.

2,772,104
**ELASTIC ARTICULATING DEVICE**
Leon F. Thiry, Chagrin Falls, Ohio
Application April 3, 1953, Serial No. 346,808
Claims priority, application France April 3, 1952
4 Claims. (Cl. 287—85)



1. A pivotal connection comprising an outer rigid member having a cylindrical bore and a resilient core co-axial with and disposed within the bore of said outer member and in pressure friction engagement therewith, said core comprising a rigid inner member having intermediate its ends a substantially continuous cylindrical outer surface of uniform diameter throughout, and an annular rubber-like bushing dilated upon said surface of the inner member and completely filling the space between said inner and outer members, with that portion of said bushing contained between said inner and outer members having in the free state a bore diameter less than the outer diameter of the inner member, and having in its dilated state upon the inner member prior to insertion of the core in the outer member a lateral surface made up of alternating projections and recesses, with the maximum diameter taken at the top of said projections being greater than the inner diameter of the outer member and with the minimum diameter at the bottom of the recesses being less than the inner diameter of the outer member.

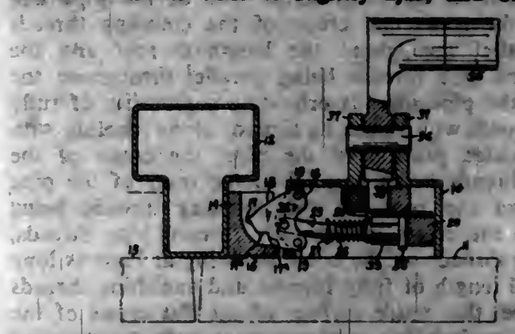
2,772,105
**WIPER RINGS**
Harold Gabriel Wyse, Dayton, Ohio
Application August 14, 1952, Serial No. 304,419
3 Claims. (Cl. 288—14)



1. A wiper ring for scraping and cleaning the surface of an axially movable shaft with substantial pressure equally distributed around the entire circumferential surface thereof, comprising a cleaning ring having a split therein extending angularly with respect to the axis thereof, said cleaning ring having its interior surface tapered inwardly forming a narrow working edge adapted to bear against said shaft, the outer surface of said cleaning ring being provided with a groove the base of which has a predetermined outside diameter, and at least one axially thin non-continuous relatively rigid radially deformable ring of metal received in said groove on edge under tension, said non-continuous ring having a solid cross-section radially of said shaft, a normal inside diameter less than the outside diameter of the bottom of said groove for compressing said cleaning ring into uniform pressure scraping contact with said shaft solely by the internal tension developed by deforming said non-continuous ring, and an outside diameter no greater than the outside diameter of said cleaning ring the split in said cleaning ring being spaced circumferentially from the break in said noncontinuous ring for effecting said uniform pressure scraping contact.

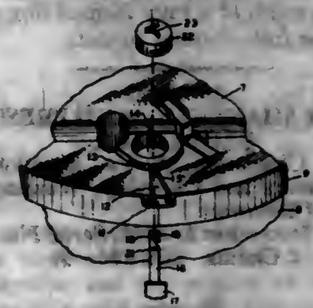
2,772,106
**DOOR LATCH**
Michael H. Samsellus, Decatur, Ill.
Application May 26, 1954, Serial No. 432,367
4 Claims. (Cl. 292—18)

1. A latch structure for the door of a refrigerator or the like, comprising a casement disposed within an outwardly opening recess in the body of the refrigerator, vertically spaced gripping jaws movable toward and from each other about vertically spaced pivot pins supported by said casement, spring means connected to said jaws and normally urging same toward each other, a bracket secured to said door and having a pair of vertically spaced rollers rotatable about horizontal axes, and inner and outer cam surfaces on said jaws alternately engageable by said rollers in the opening and closing movements of the door.



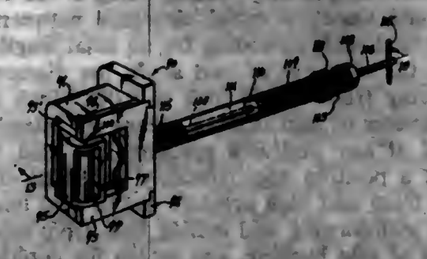
2,772,107
**LATCH MECHANISM**
Walter Youngberg, Meriden, Conn., assignor to The H. B. Ives Company, New Haven, Conn., a corporation of Connecticut
Application July 26, 1952, Serial No. 301,025
8 Claims. (Cl. 292—166)

5. A door latch adapted to engage a movable keeper member, said door latch comprising a casing, a handle member pivoted to the casing and provided with a latching shoulder, a locking member rotatably mounted on the handle adjacent the shoulder for rotation to a position to confine the keeper member between the locking member and the handle member and prevent disengagement of the shoulder from the latch member, and means releasably holding the locking member in said position.



2,772,108
**DOOR LOCK**
Charles A. Ellis, Hamden, Conn., assignor to Sargent & Company, New Haven, Conn., a corporation of Connecticut
Application July 18, 1955, Serial No. 522,471
7 Claims. (Cl. 292—191)

1. A door lock having a casing and a bolt structure mounted therein to cooperate with a relatively fixed strike member, said structure comprising a bolt head pivoted to the casing to swing about one of its edges when engaged by the strike, said bolt head having a generally curved face engaging the strike when the door is closed whereby the bolt head is cammed inwardly about its pivot when a force is applied to the door in an opening direction, and said face of the bolt head having a recess intermediate its ends to receive a portion of the strike when the door is slightly ajar, and one wall of

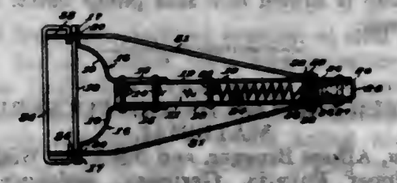


said recess being adapted to engage flatly against a surface of the strike member.

2,772,109
**SEAL FOR A METER HOUSING**
Floyd H. Busch, Rochester, N. H., and Dario A. Quagliari, Boston, Mass., assignors to General Electric Company, a corporation of New York
Application March 31, 1954, Serial No. 420,052
2 Claims. (Cl. 292—307)

1. In a meter housing, the combination of: a base member, a cover removably affixed to said base member, said cover having a flanged portion overlying the peripheral portion of said base member, a cavity in said base member, a ridge next to said cavity, a slot extending from said ridge to the periphery of said base member, a passage in said ridge communicating with said cavity and said slot, an aperture in said flanged portion normally registering with said slot when said cover is affixed in place on said base member, and a metal tab passing through said aperture, said slot, said passage, and extending within said cavity, said tab serving to lock said cover and said base member together, said tab having enlarged outer and inner heads to retain it in place, said inner head comprising a solidified plastic body embedding the inner end of said tab, said body being contained within said cavity.

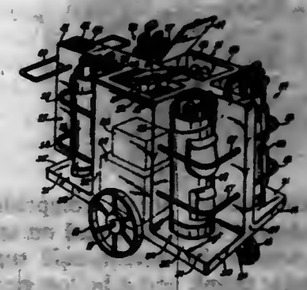
2,772,110
**SAFETY STRIKING PLATE FOR DOOR LOCKS**
John Petrochko, Glendale, N. Y.
Application January 6, 1955, Serial No. 480,251
6 Claims. (Cl. 292—341.17)



1. A safety striking plate for refrigerator and other doors comprising a casing having a rear portion adapted

for mounting on a door jamb, a keeper member pivotally mounted in the casing, said keeper member having a latch seating recess and a socket spaced from said recess, and a bolt member slidably extending through said rear portion of the casing and adapted removably to seat in the socket to prevent the keeper member from pivoting, means to lock said bolt member in the socket, said means being a bolt housing adapted to be fixed to the inner face of a door jamb, a threaded sleeve slidably passing said bolt member and connected to the bolt housing, and a threaded plug member fixed to the bolt member and adapted to screw into and out of said threaded sleeve.

2,772,111
**BALE HOOK**
Ingvald Eide, Colton, S. Dak.
Application April 13, 1953, Serial No. 348,364
5 Claims. (Cl. 294—26)



1. A bale hook structure comprising an elongated frame member, a hook element pivotally secured intermediate its ends to said frame member adjacent one end thereof, a second frame member longitudinally movable relative to said first frame member, link connections between said second frame member and the butt end of said hook element, and adjacent hand grip bars on the ends of said frame members removed from the pivoted hook element, said second frame member controlling the position of the pivoted hook element.

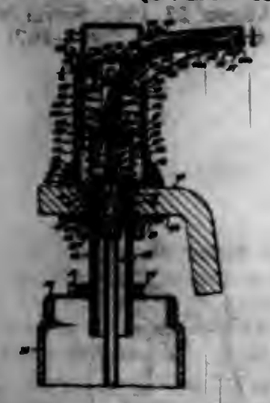
2,772,112
**BATTERY STRAP**
Theodore J. Grypma, Grand Rapids, Mich.
Application August 12, 1952, Serial No. 303,901
2 Claims. (Cl. 294—163)

1. Improvement in battery straps comprising, a battery post engaging member comprising a flat metal strap member bent back upon itself to provide upper and lower spaced flat sides between which an end of a flexible strap aligned therewith is inserted and secured, said bent portion of the strap having a generally cylindrical form adapted to receive a generally cylindrical shaft, and said sides having aligned post receiving openings extending partly into said connecting portion, said connecting portion and post openings being beyond the adjacent end of said strap, a shaft extending through and rockingly mounted in said connecting portion, having a recess in a side thereof adapted to be turned to two different positions, in one of which a battery post may freely pass into and through said openings, and in another of which the shaft is forced against the adjacent side of said post, and manually operable means for rocking the shaft, said means comprising an operating handle extending from one end of said shaft at an angle to the length thereof and providing a stop means engaging one of said sides when said shaft is in the first mentioned position.

2,772,113
**MOTORIZED CARRIER FOR MULTIPLE GOLF BAGS**
Henry Berard, Long Island City, N. Y.
Application November 27, 1953, Serial No. 394,729
2 Claims. (Cl. 296—24)

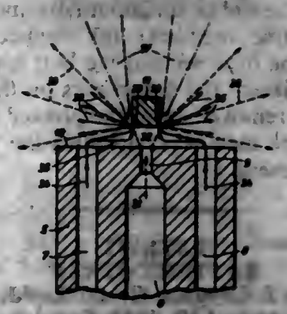
1. In a wheeled caddy cart, a rectangular-shaped floor, an upright wall extending centrally of the floor from end to end thereof, said wall serving as a common wall for a pair of opposed compartments, substantially rectangular in cross-section, said compartments being open at the top, hinged doors closing said openings, the end walls of said compartments and the central wall defining spaces at the corners of the cart for receiving golf bags supported in upright position on the floor, and metal angle straps spaced vertically along and secured to said space-defining walls for retaining the golf bags in upright position.

2,772,114
**ADJUSTABLE ATTACHMENT MEANS FOR A MOTOR VEHICLE FABRIC TOP**
Robert E. Hennessy, Allen Park, Mich., assignor to Ford Motor Company, Dearborn, Mich., a corporation of Delaware
Application August 27, 1953, Serial No. 376,907
9 Claims. (Cl. 296—107)



7. In a motor vehicle body, a fixed outer body panel having its upper marginal edge terminating adjacent the belt line of the vehicle, an inner body panel having an upper marginal edge secured to the upper marginal edge of the outer body panel and having a downwardly extending portion inclined relative to a vertical plane in an outward direction, a drain trough secured to the lower edge of said inner body panel, a retractable fabric top for the vehicle body having a rearward portion extending downwardly within the vehicle body adjacent the inner side of the downwardly inclined portion of the inner body panel, a retaining strip slidably mounted adjacent said inclined portion of the inner body panel, a tacking strip carried by said retaining portion, means connecting the lower edge of the fabric top to said tacking strip, and spring means yieldably urging said retaining strip downwardly along the inclined portion of said inner body panel to tension said fabric top.

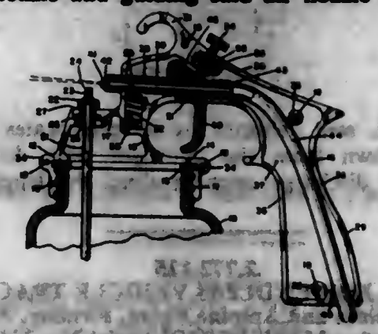
2,772,115
WINDSHIELD WASHER NOZZLE
Alfred W. Stanley, Chicago, Ill., assignor to Stanley Corporation, Chicago, Ill., a corporation of Illinois
Application March 7, 1955, Serial No. 492,713
2 Claims. (Cl. 299—73)



1. A windshield washer nozzle comprising a hollow nozzle support adapted to be mounted on an automobile adjacent to the windshield thereof, said support having an elongated tubular shank and a hollow head communicating with the shank and formed with an opening in one side, a tubular base secured in the opening in the support and communicating with the interior thereof, the base terminating at its inner end in an annular inwardly facing shoulder, and a tubular nozzle having an integral enlarged head fitting against the outer end of the base and formed with a lateral discharge port and a cylindrical shank extending rotatably through the base, the inner end of the shank being enlarged and seating tightly against the annular shoulder to hold the nozzle in the base and frictionally to resist rotation thereof relative to the base.

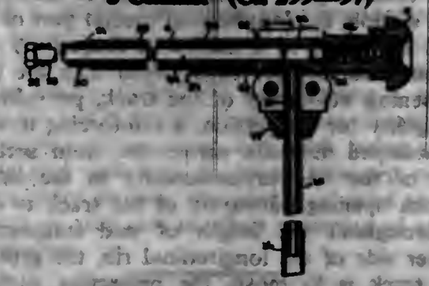
2,772,116
SOAP DISPENSERS
William J. Doblin, Jackson Heights, N. Y., assignor to American Dispenser Co., Inc., a corporation of New York
Application June 26, 1953, Serial No. 364,350
13 Claims. (Cl. 299—83)

2. In a liquid soap dispenser of the foam type, the combination comprising an air and soap mixing chamber, a piston in said chamber for pumping air into said chamber and for pumping soap and air admixture from said mixing chamber, a pump for pumping soap from a soap reservoir into said mixing chamber and comprising a pump barrel connected to one end of said mixing chamber and communicating therewith, a soap pumping piston connected to said air pumping piston for reciprocable movement therewith and extending into said pump barrel, and a valve for controlling flow of soap from said soap reservoir into said pump barrel, operable into open position when said soap pumping piston moves in one direction and operable into closed position when said soap pumping piston moves in the opposite direction, said soap pumping piston comprising a piston rod connected to said air pumping piston and extending into said pump barrel, a piston head at one end of said piston rod extending into said pump barrel and a sleeve around said piston rod between said air pumping piston and said piston head defining a passage along said piston rod between said pump barrel and said mixing chamber and short enough to have axial play along said piston rod, said piston head affording a seat for said sleeve, friction means yieldably restraining said sleeve against axial movement, said piston rod being moved along said sleeve, while said sleeve is frictionally held at the beginning of the stroke of said air pumping piston towards said pump barrel, whereby an opening is formed between said sleeve and said piston head, said sleeve for the remaining of said stroke being engaged by said air pumping piston and being moved thereby in unison with said piston rod to close said valve and to cause the soap trapped in said pump barrel to flow through said opening, through said sleeve and into said mixing chamber, said piston rod upon the return stroke of said air pumping piston, being moved with respect to the frictionally held sleeve, until said piston head seats against said sleeve, whereupon said piston head and said sleeve move together in unison to open said valve and to operate as a suction piston, whereby soap is drawn into said pump barrel from said soap reservoir.



2,772,117
ATOMIZER FOR LIQUID AND PULVERULENT MATERIAL
Ingo Ritzau, Alfons Brugger, and Balthasar Höfer, Starnberg, Upper Bavaria, Germany, assignors to Paul Ritzau, Starnberg, Germany
Application January 26, 1954, Serial No. 416,652
Claims priority, application Germany January 31, 1953
14 Claims. (Cl. 299—86)

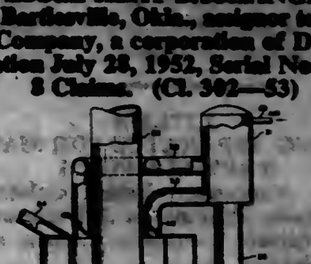
1. In an atomizer for effecting fine distribution of liquids and pulverulent solids, comprising a nozzle for producing a cone-shaped jet of a gaseous fluid, means for conducting gaseous fluid under pressure to said nozzle, a gas flow control member provided with a gas deflecting surface having at least one edge of substantial length, said member being so positioned relatively to said nozzle that said surface is in the path and substantially at right angles to the direction of said jet, and that said edge is tangent to the cone of said said jet whereby the major portion of said jet will be spread into a fan-like gas stream by said edge, a chamber at least partly below said nozzle to receive therein a supply of the substance to be atomized, and at least one duct from close to the bottom of said chamber to the vicinity of said nozzle, said duct having a discharge opening laterally of said nozzle and underneath said fan-like gas stream, whereby portions of said substance will be sucked into said fan-like gas stream along said edge.



2,772,118
SPRAYING DEVICES
Richard T. Cornelius, Minneapolis, Minn.
Application August 14, 1953, Serial No. 374,313
2 Claims. (Cl. 299—98)

1. In a spraying device, a receptacle open at the top for liquid to be sprayed, a cap for closing said receptacle, a tube extending through said cap and into the liquid, a liquid nozzle at the end of said tube and having an upwardly extending discharge passageway, a raised top on said cap, a hollow handle issuing outwardly from said top and fixed relative thereto, an air nozzle disposed within said handle, a flexible tube for connection to a source of air under pressure connected to said nozzle and extending through said handle, said air nozzle being disposed to one side of said liquid nozzle and having a discharge passageway transverse to the passageway in said liquid nozzle, pivot means acting between said handle and air nozzle and guiding said air nozzle for swinging

movement from an operative position at said nozzle and at which the air stream therefrom traverses the open end of the liquid nozzle and to an inoperative position away from said liquid nozzle, said tube flexing to accommodate such movement, a spring acting between said nozzle and the top of said cap and urging the air nozzle into inoperative position and a finger piece on said nozzle disposed above said cap and rearwardly of the raised top thereof and engageable for moving the air nozzle into operative position when the handle is grasped.

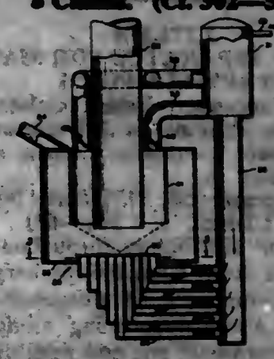


2,772,119
OPERATING MECHANISM FOR SPRAY GUNS
George Goda, Brooklyn, N. Y., assignor to Champion Implement Corp., New York, N. Y., a corporation of New York
Application March 5, 1954, Serial No. 414,262
3 Claims. (Cl. 299—97)

1. In a spray gun having a body, a cylinder mounted in said body, a piston operating therein, a spray nozzle at one end thereof and means for reciprocating said piston, the improvement which comprises a sleeve one end of which is secured to the end of said cylinder opposite said nozzle, the inner diameter of said sleeve being greater than the diameter of said piston, a lubricating bearing in the opposite end of said sleeve, said piston extending through said sleeve and bearing, said cylinder having an enlarged diameter into which said sleeve fits and a ring washer between the end of said sleeve and the shoulder formed at the junction of the two diameters of said cylinder.

2,772,120
UNITARY SPRAY NOZZLE AND FILTER ASSEMBLY
Eugene O. Olson, Des Moines, Iowa, assignor to Delavan Manufacturing Company, West Des Moines, Iowa, a corporation of Iowa
Application February 14, 1955, Serial No. 487,992
2 Claims. (Cl. 299—120)

1. A spray nozzle for liquids including in combination a cylindrical housing externally threaded at the liquid inlet end and having an axial bore therein terminating in a conically-shaped outlet and having a central discharge orifice; a distributor plug having a frusto-conical nose, with grooves in the surface thereof, disposed within said outlet and adapted to direct fluid flow through said orifice; a generally cylindrical-shaped filter member of



smaller diameter than said bore having a central axial opening and a liquid-permeable wall the end of which facing the nozzle outlet is sealed against flow thereabout; and a retainer ring bearing against the filter member at the inlet end, said housing being turned radially inwardly over said ring for locking said ring, said filter member and said distributor plug within said housing.

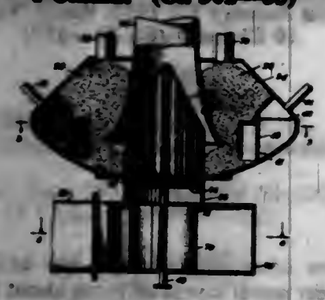
2,772,121
COMPOSITE SHEET METAL ARTICLE AND METHOD OF MANUFACTURE
Milton F. Meissner, Ladue, Mo., assignor to Olin Mathieson Chemical Corporation, a corporation of Virginia
Application January 17, 1952, Serial No. 266,953
10 Claims. (Cl. 29—199)

7. A hollow composite multiple ply article consisting of bonded sheet metal layers of from about 80% to about 95% copper, from about 1.25% to about 4% iron, and the balance zinc, and across the interface between the abutting portions of adjacent layers an intergranular bond consisting of the adherent and coalesced recrystallized surface grains of said layers of metal on each side of the interface alloyed with substantially all of an amount of tin not in excess of that sufficient for accelerating the recrystallization at elevated temperature of said surface grains only.

2,772,122
PEBBLE HEAT EXCHANGER
Dick S. Hall, Bartlesville, Okla., assignor to Phillips Petroleum Company, a corporation of Delaware
Application July 28, 1952, Serial No. 301,406
8 Claims. (Cl. 302—53)

1. A pebble feeder comprising in combination a first upright cylindrical shell having top and bottom closure members; a second cylindrical shell coaxial with said first

shell fixed to said top closure member and forming an annulus between the two shells, said second shell extending into the lower section of the chamber formed by said first shell; a pebble inlet conduit connecting with the upper section of aforesaid annulus; an elevator conduit coaxial with said shells extending upwardly from a level adjacent the lower end of said second shell thru said top closure member and forming a second annulus with said second shell; at least one primary gas supply conduit connected with said second annular space; several secondary gas supply conduits coaxial with said shells and leading upwardly thru said bottom closure member to a level below said elevator conduit to provide a cylindrical and a plurality of annular gas passages directed toward the lower end of said elevator conduit, said conduits extending outwardly beyond said elevator conduit, the structure thus far defined providing at least a layer of pebbles over each of said secondary gas supply conduits when a stream of pebbles is fed to said feeder thru said pebble inlet conduit; and means for supplying a lifting gas to each of said gas supply conduits.



---

2,772,123

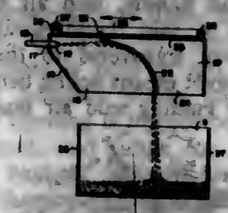
## APPARATUS FOR PNEUMATICALLY LIFTING GRANULAR CONTACT MATERIAL

Harold O. Malcolm, Augusta, Kans., and William A. Hagenbuch, Westfield, N. J., assignors to Socony Mobil Oil Company, Inc., a corporation of New York

Application March 18, 1952, Serial No. 277,122
8 Claims. (Cl. 302—53)

1. In a pneumatic lift in which a granular contact material is conveyed upwardly through a substantially vertical lift passageway, the improved apparatus for introducing lift gas into the lower end of the passageway which comprises: a gas housing having a generally circular wall, a gas inlet conduit attached tangentially to the wall of said housing, a central vertical discharge conduit attached to the top of said housing, said conduit being substantially coaxial with the lift passageway and terminated near the bottom of said passageway, and means situated between said gas inlet conduit and said vertical lift passageway for effecting removal of the rotary movement from he lift gas due to its introduction into said housing via said tangential gas inlet conduit.

---



2,772,124

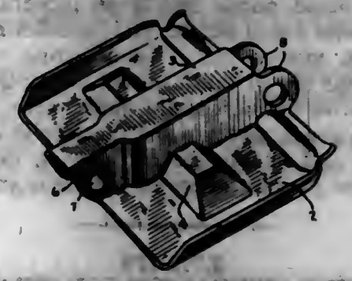
## DISTRIBUTING APPARATUS FOR MATERIAL IN PARTICLE FORM

William Smith, Vancouver, British Columbia, Canada, assignor to Radar Pneumatics & Engineering Co. Ltd., Vancouver, British Columbia, Canada, a corporation of British Columbia

Application December 28, 1955, Serial No. 555,965
12 Claims. (Cl. 302—61)

1. Apparatus for distributing throughout a container material in particle form from the discharge of a pneumatic conveyor, comprising an elongated hood having a relatively long discharge opening along the bottom thereof and an entrance at one end near the top thereof into which the discharge end of a pneumatic conveyor pipe may extend, said pipe end extending in the same direction as the hood, a downwardly curved deflector mounted in the hood for movement longitudinally thereof, the upper end of said deflector being aligned with the hood entrance and the deflector curving outwardly from said entrance, and means for reciprocating the deflector

in the hood, said deflector as it reciprocates directing material blown from the conveyor pipe downwardly through the discharge opening along the length of the latter.



---

2,772,125

## SHOE FOR ENDLESS VEHICLE TRACKS

André Faure and Antoine Faure, Firminy, France

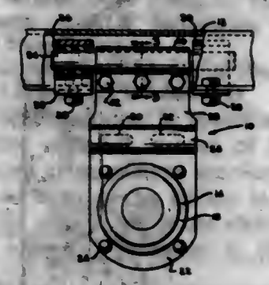
Application March 24, 1953, Serial No. 344,301
Claims priority, application France April 17, 1952
2 Claims. (Cl. 305—10)

1. In an endless track for vehicles associated with driving sprockets and bearing rollers, the provision of a plurality of similar directly interconnected unitary plates each consisting of a single one-piece stamped flat sheet metal section, the longitudinal medial part of which is bent into the shape of a narrow U-shaped rib having a smooth outer surface for engagement with the rollers, said rib, opening outwardly of the track, providing longitudinal rigidity for the section, a reinforcing transverse rib being stamped medially across the main section to either side of the rib perpendicularly to the latter to form a recess opening outwardly of the track to engage directly, throughout the length of said transverse rib and to either side of the longitudinal rib, the ground on which the track is to move, the projecting surface of said transverse rib being adapted to operatively engage driving sprockets for said track, and perforated lugs and a pair of ears integral respectively with the medial parts of the opposite transverse edges of said section and merging directly into the corresponding ends of the longitudinal rib, the ears on one flat section being adapted to engage operatively the lugs on the flat section of the adjacent plate.

---

2,772,126

## SHAFT HANGER



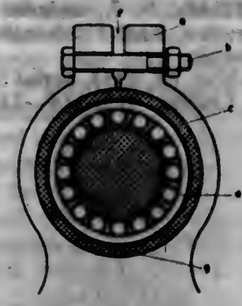
Frederick M. Guy, Detroit, Mich., assignor to U. S. Universal Joints Company, a corporation of Michigan

Application April 27, 1953, Serial No. 351,142
10 Claims. (Cl. 308—28)

1. In a resilient shaft hanger, the combination of a housing formed from two vertically disposed sheet metal stampings secured together for receiving a shaft journaling bearing, the upper portions of said stampings having straight horizontal concave channels facing one another so that when said stampings are secured together straight horizontal jaws are formed which are partially open on their upper ends, a depending hanger member extending

through the partial opening in the jaws, said hanger member including a rubber-like element carried by its lower

end portion and clamped by said jaws in a preloaded condition.



---

2,772,127

## BEARING MOUNTING AND METHOD OF MAKING SAME

Gino Sborlino, Milan, Italy, assignor to Loro & Parisini Societa per Azioni, Milan, Italy, a firm

Application June 24, 1952, Serial No. 295,255
Claims priority, application Italy June 30, 1951
2 Claims. (Cl. 308—178)

2. In a device for mounting a conventional ball or roller bearing, the combination of a support provided with a bifurcated portion adapted to form a cylindrical seat; an elastic cylindrical bush having a single longitudinal slit and a machined inner face adapted to receive said bearing thereagainst, said bush being mounted in said support with said slit being arranged remote from the bifurcated portion, and means adapted to reduce the diameter of said seat to effect clamping of said bush in said member.

---

2,772,128

## CAGE FOR NEEDLE BEARINGS

Georg Schaeffler and Emil Bonsch, Herzogenaurach, near Nurnberg, Germany, assignors to Industriewerk Schaeffler, Herzogenaurach, near Nurnberg, Germany

Application June 11, 1954, Serial No. 436,161
Claims priority, application Germany June 13, 1953
2 Claims. (Cl. 308—217)

1. A cylindrical bearing cage for needles comprising a pair of parallel end faces, a plurality of parallel webs interconnecting said end faces and thereby forming a plurality of spaced apertures, a pair of tapered ended needles adjoiningly arranged in each of said apertures, protruding surfaces formed on said webs, and web-like projections formed centrally on said end faces intermediate of said webs extending radially in said apertures for coacting with said webs to effect individual guidance of said adjoining needles and for coacting with said protruding surfaces for effecting retention of said adjoining needles within said aperture.

---

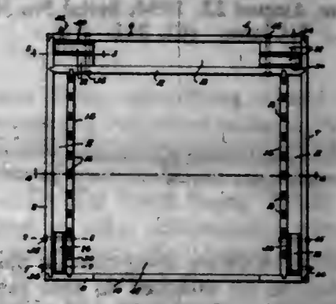
2,772,129

## PISTON PACKING RING

Frank D. Frisby, St. Louis, Mo., assignor to Frisby Corporation, St. Louis, Mo., a corporation of Missouri

Application July 16, 1952, Serial No. 299,100
18 Claims. (Cl. 309—45)

1. A piston packing ring comprising a plurality of concentric annular torsion sealing elements, each of said elements having a gap therein, said gaps being positioned in a staggered formation, said elements being bonded together at a point between said gaps, said elements developing an instantaneous opposed and alternating frictional reaction between their adjacent surfaces upon circumferential contraction and expansion of the assembled ring during operation.



---

2,772,130

## FOLDING DRAFTING TABLE

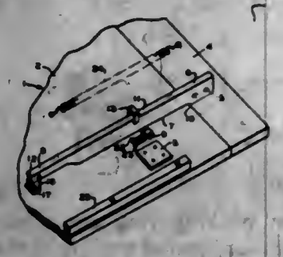
John O. Pritchard, Sheridan, Wyo.

Application July 8, 1955, Serial No. 520,728
5 Claims. (Cl. 311—38)

1. A combined drafting table and carrying case, comprising a box-like body including side panel members and front and rear panel members connected at their ends to said side members, an inner frame embodying a rear member arranged in parallel spaced relation with said rear panel member providing a leg compartment at the rear of said case, side members arranged in parallel spaced relation with said side panel members and secured at one of their respective ends to said rear member of said inner frame, the other ends of said side members of said inner frame being connected to said front panel member providing elongated compartments at the sides of said case, a bottom panel closing the bottom of said inner frame, a vertically swinging closure panel adapted to close the top of said table, and leg members pivotally mounted within said leg compartments.

---

2,772,131

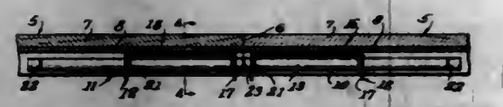


## SLIDE ASSEMBLY FOR SLIDE LEAF EXTENSION TABLES

Joseph Cooper, New York, N. Y.

Application March 13, 1956, Serial No. 571,322
3 Claims. (Cl. 311—55)

1. In a table having at least one slide leaf extension attached to a primary table top, said extension being mov-

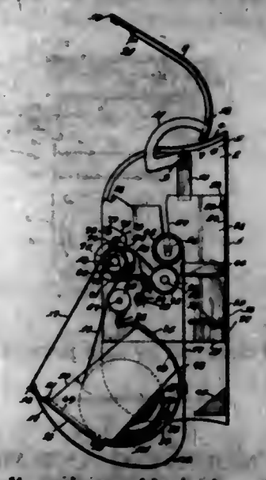


able between an open and a closed horizontal position, a slide assembly for the movement of said slide leaf extension comprising a normally horizontal slidable bar attached at its outer end to the lower surface of said extension, said bar having a top surface which slopes inwardly and downwardly near its inner end, and then continues horizontally to provide an inner finger-like section of said bar, a downwardly extending hanger member suspended from the under surface of said table top and slidably supporting said bar, a guide member sus-

pended beneath said table top in longitudinal alinement with said hanger member, and providing a track for guiding said bar, and a wave member attached to the under surface of said table top and having an outer end spaced from said under surface, said bar bearing a locking flange projecting from one side of the top surface thereof, and said wave member being adapted to receive said locking flange between its said outer end and the table under surface when said slide leaf extension is in open position.

---

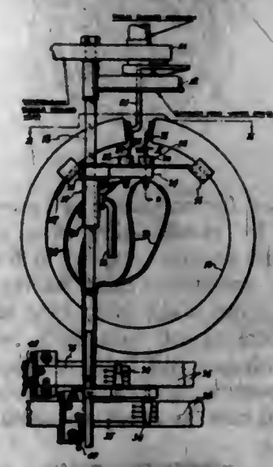
**2,772,132**
**EXTENSION TABLE HARDWARE**
Carl F. Kayler, South Gate, Calif.
Application August 23, 1954, Serial No. 451,508
1 Claim. (Cl. 311—71)



Extension table hardware comprising a pair of similar brackets adapted to be attached to said table, each of said brackets having a pair of end-bearing walls, an elongated tubular member extending between said brackets and through said bearing walls, an integral stop located in the center of said tubular member, and a pair of integral end stops located at the ends of said tubular member, one of said brackets being located between one end stop and the center stop, and the other bracket being located between the other end stop and the center stop, and said stops being adapted to have abutting engagement with the walls of said brackets.

---

**2,772,133**
**DISPENSING APPARATUS FOR SHEET MATERIAL**
Rudolph G. Birr, Lombard, Ill., assignor to American Linen Supply Co., Chicago, Ill., a corporation of Nevada
Application July 14, 1951, Serial No. 236,807
13 Claims. (Cl. 312—38)



1. A towel dispensing cabinet of the continuous type having a measuring roll carried by a pinch roll, and in which the toweling is wrapped around said measuring roll and is pulled downwardly to dispense it, and having a soiled towel take-up drive roll, and in which said drive roll is driven from the measuring roll by two spur gears, and floating bearing means for said pinch roll to permit limited slight downward movement of said measuring roll against said pinch roll to increase the pressure of

said measuring roll against said pinch roll in response to said downward pull of said toweling.

---

**2,772,134**
**APPARATUS FOR MANUFACTURING DISCHARGE LAMPS**
Daniel Mullan, Hillside, N. J., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application May 29, 1953, Serial No. 358,412
3 Claims. (Cl. 316—32)

1. In apparatus for manufacturing arcuate discharge lamps, a spider rotatable about a vertical axis, a plurality of stations disposed about its periphery, said spider having a plurality of heads corresponding in number and spacing with said stations and connected to exhausting and gas-filling means, a non-circular rod suspended from said spider adjacent each head, an insulating platform slidably mounted on each rod and held against rotation by the non-circular configuration of said rod, means for clamping each platform in a desired longitudinal position along said rod, four metal energizable cups carried by each platform, a quantity of granular metal disposed in each cup, means extending from said platform including arcuately disposed members for supporting an arcuate discharge lamp on said spider at each head with its ends and radially extending exhaust tubulation uppermost and with the exhaust tubulation projecting vertically into said head for processing said discharge lamp, and with the arcuately disposed members engaging the underside of the upper portions of the lamp envelope, so that the lamp leads depend from the upper disposed lamp ends and are conveniently insertable in said energizable cups, and means for indexing said spider from station to station.

**2,772,135**
**METHOD AND APPARATUS FOR MAGNETICALLY RECORDING VIDEO-FREQUENCY SIGNALS**
Max G. Hollabaugh, Jackson Heights, and Fred D. Shea and Kenneth R. Wilson, New York, N. Y., assignors, by mesne assignments, to ACF Industries, Incorporated, a corporation of New Jersey
Application August 15, 1952, Serial No. 304,614
5 Claims. (Cl. 346—74)

1. A recording head including in combination a ribbon of highly conductive material, a core of ferromagnetic material of U-shaped cross section surrounding two opposed sides and one edge of the ribbon intermediate its ends so that only the other edge of the ribbon is exposed, and an elongated compliant member in the form of a leaf spring one end of which is attached to the core adjacent the exposed ribbon edge so that the head is supported by the member, the exposed edge of the ribbon, the

adjacent ends of the core and the planar portion of the spring contiguous the attached end thereof forming an uninterrupted surface for positioning the head with respect to the recording medium.

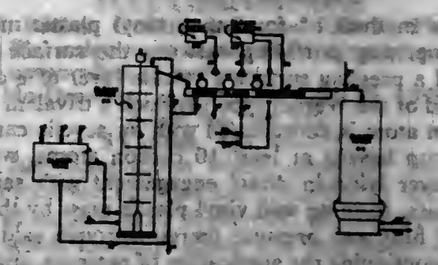
---

## CHEMICAL

**2,772,136**
**DYEING OF TEXTILE MATERIALS USING MOLTEN METAL**
Robert S. E. Hanney, Edinburgh, Scotland, and William Kilby, Lancaster, England, assignors to Standfast Dyers and Printers Limited
No Drawing. Application May 19, 1952, Serial No. 288,761
Claims priority, application Great Britain May 26, 1951
12 Claims. (Cl. 8—1)

1. In a process of dyeing textile materials with dyestuffs which are adversely affected by reducing agents in which the material after application of an aqueous dye liquor thereto is passed through a bath of molten metal, the improvement which comprises incorporating into the impregnated material entering the molten metal a mild oxidizing agent incapable of exerting a rapid oxidizing influence upon the metal of the molten bath and also of insufficient strength to bleach the dyestuff said oxidizing agent having no greater oxidizing strength than sodium chlorate in a neutral bath.

---



**2,772,137**
**WOOD STAIN METHOD OF INCREASED LIGHTFASTNESS**
Ira Weber, Long Island City, N. Y., assignor to Interchemical Corporation, New York, N. Y., a corporation of Ohio
No Drawing. Application May 6, 1953, Serial No. 353,430
2 Claims. (Cl. 8—6.5)

1. In the method of staining wood consisting of applying to the wood a solution of the alkali salt of at least one sulfonic acid-azo dyestuff in a penetrant vehicle consisting of a mixture of ethyl ether of ethylene glycol and methanol, the improvement which consists in applying to the stained surface a solution consisting of 5 to 10% by weight, of a heavy metal salt of the group consisting of the salts of barium, calcium, strontium, manganese and aluminum, dissolved in a solvent consisting of a mixture of ethyl ether of ethylene glycol and methanol.

---

**2,772,138**
**CONTINUOUS BLEACHING PROCESS**
Forest B. Evans, Claddis Ford, Pa., assignor to Hercules Powder Company, Wilmington, Del., a corporation of Delaware
Application December 31, 1952, Serial No. 329,653
7 Claims. (Cl. 8—156)

1. The method for the continuous purifying of cellulose fibers which comprises, in combination, forming a dilute aqueous slurry of said fibers, continuously passing aqueous slurry and chlorine gas to a lower portion of a contacting zone and therein contacting said fibers and chlorine in a first bleaching step, continuously withdrawing a slurry of fibers and bleach liquor from an upper portion of said contacting zone, continuously passing withdrawn slurry to an incorporation zone, removing bleach liquor from said fibers in said incorporation zone and recycling removed bleach liquor to said contacting zone, in said incorporation zone washing remaining bleach liquor from said fibers with water and adding an aqueous solution of a member of the group consisting of bleaching agents and alkaline extraction agents to the washed fibers in an amount in excess of the amount required for the second reaction step, in said incorporation zone removing excess aqueous solution diluted with wash

water from said fibers, refortifying diluted excess aqueous solution, recycling refortified aqueous solution to said incorporation zone for incorporation in additional cellulose fibers, throughout their passage through said incorporation zone said fibers being in the form of a continuous sheet or cake, continuously withdrawing cellulose fibers wetted with the amount of aqueous solution required for the second reaction step from said incorporation zone, and continuously reacting withdrawn cellulose fibers with wetting aqueous solution in a second reaction step.

---

**2,772,139**
**METHOD OF PREPARING PHENOL DERIVATIVES OF WASTE SULPHITE LIQUOR, INCLUDING REMOVING THE CALCIUM IONS FROM THE WASTE LIQUOR**
Harry B. Marshall, Toronto, Ontario, and Mary Curran, née Krimm, Calgary, Alberta, Canada, assignors to Ontario Research Foundation, Toronto, Ontario, Canada
No Drawing. Application February 13, 1956, Serial No. 565,274
4 Claims. (Cl. 8—94.31)

1. A process for the production of useful substances from calcium base waste sulphite liquor containing calcium lignin sulphonate compounds which consists of removing the calcium ions from the waste sulphite liquor by precipitation with sulphuric acid, heating the decalcified waste sulphite liquor to a temperature of between 100° C. and 150° C. with an excess of a phenol, said phenol being selected from the group consisting of monohydric, dihydric and trihydric phenols and combinations thereof, for a time sufficient to condense the lignin sulphonate compounds with said phenol, and removing the excess phenol.

2,772,140

## TANNING AGENT COMPRISING PHENOL DERIVATIVES OF WASTE SULPHITE LIQUOR AND METHOD OF PREPARING SAME

Harry Borden Marshall and Mary Krisman, Toronto, Ontario, Canada, assignors to Ontario Research Foundation, Toronto, Ontario, Canada

No Drawing. Application July 16, 1952, Serial No. 299,278

6 Claims. (Cl. 8—94.31)

6. A tanning agent consisting of a combination of natural tannins and a compound derived from waste sulphite liquor by removing the cations from the waste sulphite liquor by treatment with an ion exchange resin, heating the decationized waste sulphite liquor to a temperature of between 100° C. and 150° C. with an excess of a phenol, said phenol being selected from the group comprising monohydric, dihydric and trihydric phenols and combinations thereof, and removing the excess phenol.

2,772,141

## MANUFACTURE OF PLASTIC FLOOR COVERING

Lawrence H. Dunlop, Lancaster Township, Lancaster County, Pa., assignor to Armstrong Cork Company, Lancaster, Pa., a corporation of Pennsylvania

No Drawing. Application February 26, 1952, Serial No. 273,560

13 Claims. (Cl. 18—47)

1. In a method of forming a vinyl plastic mass, the steps comprising providing between the surface of said mass and a pressing surface a release layer of a complex compound of the Werner type in which a trivalent nuclear chromium atom is coordinated with an acyclic carboxylic acido group having at least 10 carbon atoms, with said release layer lying in direct engagement with said vinyl plastic mass, forming said vinyl plastic mass by the application of heat and pressure thereto through said release layer, discontinuing the application of pressure, and releasing said formed vinyl plastic mass from said pressing surface, said layer facilitating said release.

2,772,142

## PROCESS OF RECLAIMING URANIUM FROM SOLUTIONS

Ross Cummings, Berkeley, Calif., assignor to the United States of America as represented by the United States Atomic Energy Commission

Application April 21, 1944, Serial No. 532,161

8 Claims. (Cl. 23—14.5)

1. A process for reclaiming uranium compound deposits from calutron parts, which parts contain a metal of the group consisting of copper and iron, which comprises washing said parts with a solvent for the uranium compound, thereby obtaining a solution of the uranium compound containing said metal as an impurity, treating the wash solution with iron scrap, whereby the uranium is reduced to its tetravalent state, drawing off the reduced solution, treating the reduced solution with ammonia to precipitate the uranium as uranous hydroxide in the solution, separating the uranous hydroxide precipitate and associated solid metal impurities from the solution, producing an aqueous slurry of the thus-separated uranous hydroxide and associated solid metal impurities, subjecting the slurry to froth-flotation treatment, whereby the solid metal impurities are carried away with the froth leaving the uranous hydroxide precipitate suspended in the slurry, and then separating the uranous hydroxide precipitate from the slurry.

2,772,143

## METHOD OF RECOVERING MAGNESIUM SALTS FROM SEA WATER

William F. McIlhenny and Albert B. Baker, Freeport, and James A. Clarke, Lake Jackson, Tex., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Application September 30, 1953, Serial No. 383,197

4 Claims. (Cl. 23—91)

1. In a process for producing a magnesium salt from sea water, wherein the sea water is brought into contact with a cation exchange resin whereby magnesium ions are absorbed on the resin and are removed from the solution and the absorbed magnesium ions are eluted from the resin by contacting the resin with a stream of an aqueous alkali metal salt solution, containing the alkali metal salt in amount corresponding to at least 10 percent by weight of the solution, with formation of a magnesium salt solution containing the magnesium in higher concentration than in the sea water, the steps which consist in pre-treating the sea water by adding sodium carbonate thereto in amount chemically equivalent to from 75 to 85 percent by weight of the dissolved calcium and an alkali selected from the group consisting of ammonia, ammonium hydroxide, potassium hydroxide and sodium hydroxide, in amount sufficient to bring the aqueous liquid to a pH value between 8.5 and 9.5, with resultant formation of an insoluble precipitate of a predominant amount of the calcium solute while the principal proportion of the magnesium salt remains in solution, separating the precipitate from the liquid, then passing the clarified aqueous liquor into contact with a cation exchange resin in a form suitable for absorbing magnesium ions from the aqueous solution.

2,772,144

## PRODUCTION OF SULPHURYL FLUORIDE

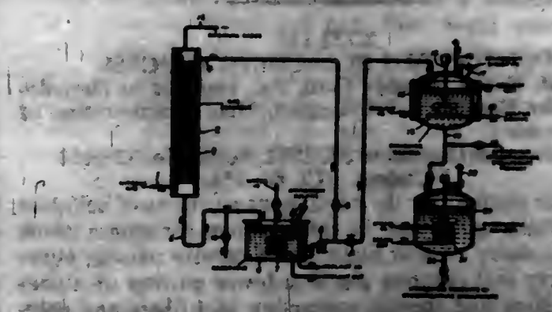
Leon Jerry Bolf, Bristol, England, assignor to The National Smelting Company Limited, London, England

No Drawing. Application August 25, 1953, Serial No. 376,511

Claims priority, application Great Britain August 29, 1952

2 Claims. (Cl. 23—203)

1. The method of producing sulphuryl fluoride by reaction between sulphuryl chloride gas and hydrogen fluoride gas comprising simultaneously passing said gases over activated charcoal while maintaining the reaction temperature at about 350 to 450° C., and recovering sulphuryl fluoride from the resulting gaseous product.



2,772,145

## PROCESS FOR MAKING AMMONIUM NITRITE AND AMMONIUM HYDROXYLAMINE DISULFONATE

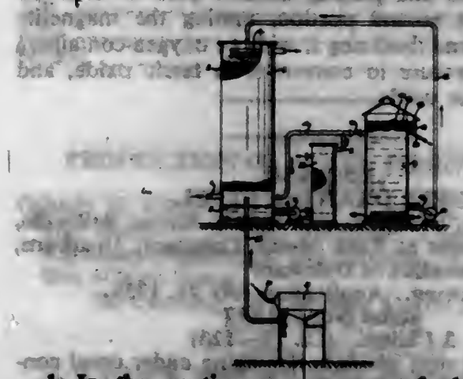
George G. Jeris, Madison, N. J., and Alvin J. Sweet, East Aurora, N. Y., assignors to Allied Chemical & Dye Corporation, New York, N. Y., a corporation of New York

Application February 27, 1953, Serial No. 339,272

4 Claims. (Cl. 23—104)

1. A process for making ammonium nitrite and ammonium hydroxylamine disulfonate which comprises: contacting a nitrous gas containing nitric oxide and nitrogen dioxide with a body of aqueous solution maintained during the contacting in an alkaline condition by the incorporation therein of ammonium sulfite and in the temperature range from about its freezing point to about 45° C., in which the nitrous gas delivered for contact with the body of aqueous solution has a nitric oxide: nitrogen dioxide mol ratio greater than 10:1 and the combined concentration of ammonium nitrite and ammonium hydroxylamine disulfonate in said body of aqueous solution is maintained below 3.12 gram mols per 1000 grams of solution during the contacting with the nitrous gas.

2,772,146



## PROCESS FOR THE RECOVERY OF ELEMENTARY SULFUR FROM GASES CONTAINING HYDROGEN SULFIDE

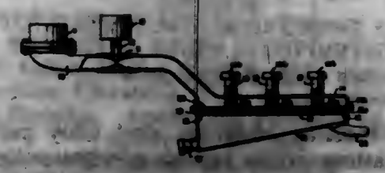
Heinz Pippig, Mainz, Germany

Application September 20, 1952, Serial No. 311,909

Claims priority, application Germany October 1, 1951

4 Claims. (Cl. 23—225)

1. In the continuous recovery of elementary sulfur from a gas containing hydrogen sulfide by a process involving the steps of absorbing hydrogen sulfide from the gas in an alkaline washing liquid including a free oxygen-containing oxidizing agent for hydrogen sulfide by washing said gas with said washing liquid in a washing stage, thereafter treating said washing liquid with oxygen in an oxidizing stage to oxidize the absorbed hydrogen sulfide to elementary sulfur, removing said sulfur from the washing liquid and recycling the latter into said washing stage in order to absorb hydrogen sulfide from another portion of gas, the improvement which comprises maintaining the hydrogen sulfide-enriched washing liquid within the oxidizing stage at a temperature not in excess of about 25° C. artificial cooling of said enriched liquid.



2,772,147

## EXHAUST GAS TREATING UNIT

William M. Bowen III, Chester, and Eugene J. Houdry, Ardmore, Pa., assignors, by direct and mesne assignments, to Oxy-Catalyst, Inc., a corporation of Pennsylvania

Application April 6, 1951, Serial No. 219,623

5 Claims. (Cl. 23—288)

1. Catalytic apparatus adapted for attachment to automotive vehicles and the like for elimination of obnoxious components of exhaust gases therefrom and including a bed of catalyst particles which tend to become coated with foreign matter during the exhaust gas loss-free activity, said apparatus [illegible] attachment to said vehicle or the like and subject to vibration transmitted from said vehicle thereto, a container for said catalyst particles mounted within said housing and comprised of a pair of spaced apart, parallel, foraminous members extending across said housing and defining between them a relatively shallow space for receiving a layer of catalyst particles, means connecting said housing to the exhaust manifold of the vehicle engine whereby exhaust gases therefrom pass through said foraminous members in contact with said catalyst particles, at least one catalyst supply hopper extending substantially vertically from and opening into said catalyst containing means, whereby on vibration of said housing during operation of said vehicle, catalyst particles flow by gravity from said hopper into said catalyst containing means to replace catalyst lost from said container by attrition and thus to maintain a substantially uniform level of catalyst in said container, flow restricting means at the discharge end of said hopper for restricting the flow of said catalyst particles into said container, said flow restricting means being arranged to prevent said particles from rising above a predetermined level in said container, thus preventing said container from becoming tightly packed with catalyst particles and thereby assuring movement of said catalyst particles within said container at all times in response to vibration transmitted thereto from the vehicle so as to free said particles from foreign deposits as they accumulate.

2,772,148

## FUEL COMPOSITIONS

Allen E. Bruhn, Griffith, Ind., and Ellis K. Fields, Chicago, Ill., assignors to Standard Oil Company, Chicago, Ill., a corporation of Indiana

No Drawing. Application April 18, 1955, Serial No. 502,212

5 Claims. (Cl. 44—71)

1. A fuel composition which comprises essentially a light hydrocarbon distillate and about 0.0001 to 0.1 weight percent of an oil soluble N-alkyl-N', N'-di(carboxymethyl) urea in which the alkyl group is a long chain containing 10 to 40 carbon atoms.

2,772,149

## GENERATION OF SYNTHESIS GAS AND APPARATUS THEREFOR

Paul W. Garbo, Freeport, N. Y., assignor to Hydrocarbon Research, Inc., New York, N. Y., a corporation of New Jersey

Continuation of application Serial No. 723,548, January 22, 1947. This application December 13, 1951, Serial No. 261,764

5 Claims. (Cl. 48—196)

4. In a process for the generation of a gaseous mixture of hydrogen and carbon monoxide by the interaction of reactants comprising a hydrocarbon gas and oxygen, the steps which comprises passing hydrocarbon gas into a closed reaction zone through a porous barrier, forcibly directing a stream of substantially pure oxygen against the surface of said barrier within said reaction zone at an acute angle thereto whereby the oxygen is distributed along said surface into intimate contact with said hydro-

carbon and said surface is maintained incandescent by flameless surface combustion, withdrawing from the vicinity of said surface the resulting reaction products consisting essentially of hydrogen and carbon monoxide, periodically discontinuing the flow of reactants and passing oxygen through said porous barrier, and thereafter restoring the flow of hydrocarbon gas through said barrier and reintroducing oxygen at said acute angle.

---

2,772,150
VITREOUS GRINDING COMPOSITION
George August Rieke, Chicago, Ill.
No Drawing. Application May 17, 1951, Serial No. 226,949
6 Claims. (Cl. 51—300)

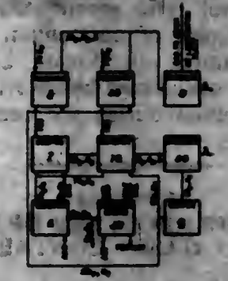
2. A vitrified grinding tool formed of a composition consisting essentially of finely divided inorganic abrasive particles selected from the group consisting of silicon carbide, Carborundum, diamonds and zircon, an inorganic clay binder and an exfoliated micaceous mineral in which the materials are present in the ratio of 5–50 parts by weight of the inorganic clay binder, 95–50 parts by weight of the inorganic abrasive and 5–25 parts by weight of exfoliated micaceous mineral to 100 parts by weight of the clay binder, which has been heated in admixture to a temperature for vitrification and in which the particles of exfoliated micaceous mineral remain identifiable in the vitrified product as distinguished from the loss of identity of mica when incorporated without previous exfoliation.

---

2,772,151
CORRECTION OF IRON DEFICIENCIES IN GROWING PLANTS
Alexander A. Nikitin, College Park, Ga., assignor to Tennessee Corporation, New York, N. Y., a corporation of New York
No Drawing. Application February 20, 1956, Serial No. 566,394
6 Claims. (Cl. 71—1)

1. The method of supplying nutritional iron to plants growing in iron-deficient soil which comprises supplying iron to the plant in the form of ferrous oxalate in contact with the tissues of the growing plant.

---



2,772,152
TOBACCO DESUCKERING COMPOSITIONS
Robert Earl Emond, Moorestown, Lambton, Ontario, and Warren C. Puttenden, Courtright, Lambton, Ontario, Canada, assignors to Esso Research and Engineering Company, a corporation of Delaware
No Drawing. Application April 29, 1954, Serial No. 426,574
5 Claims. (Cl. 71—2.3)

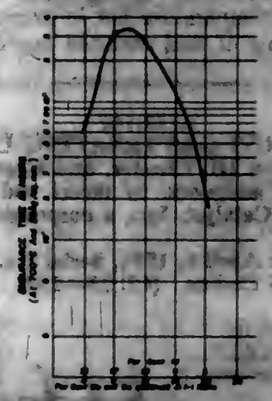
1. A tobacco desuckering grease composition which comprises in combination a petroleum mineral white oil having a viscosity of 80–1000 SUS at 100° F. and from 2–40% of a grease forming component, said paste being further characterized in having an ASTM penetration (unworked) in the range of 150–420.

---

2,772,153
ROASTING PYRITES
James R. West, Pittsburgh, Pa., and Frederick Gormley, Vera Cruz, Mexico, assignors to Texas Gulf Sulphur Company, New York, N. Y., a corporation of Texas
Application August 4, 1950, Serial No. 826,469
7 Claims. (Cl. 75—9)

1. That method of roasting pyrites to produce sulfur and ferric oxide comprising fluidizing one portion of pyrites with nitrogen-containing gas substantially free from oxygen at a temperature to drive off the labile sulfur atom and form pyrrhotite, separately fluidizing a second portion of pyrites in the same manner, recovering the sulfur from said treatments, fluidizing the pyrrhotite from said one portion with an oxygen-containing gas at a temperature to convert it to magnetite and produce sulfur dioxide, fluidizing the pyrrhotite from said second portion with sulfur dioxide, including that from said one portion, at a temperature to convert the pyrrhotite to magnetite with production of a mixture of sulfur dioxide

and sulfur vapor, condensing sulfur from said mixture and passing part of the residual sulfur dioxide to treat said one portion and passing another part to treat the pyrrhotite from second portion, uniting the magnetite thus produced and fluidizing it with an oxygen-containing gas at a temperature to convert it to ferric oxide, and recovering ferric oxide.



---

2,772,154
DEEP DRAWING STEEL
Eric R. Morgan, Dearborn, and John C. Shyne, Belleville, Mich., assignors to Ford Motor Company, Dearborn, Mich., a corporation of Delaware
No Drawing. Application July 24, 1956, Serial No. 599,677
2 Claims. (Cl. 75—123)

1. A rimmed steel which is non-aging under usual conditions of commercial storage, said steel containing from between 0.003 percent and 0.02 percent carbon.

---

2,772,155
HEAT-RESISTING AUSTENITIC STEEL ALLOYS
Friedrich Hinrichsen and Walter Siegfried, Winterthur, Switzerland, assignors to Sulzer Freres, Societe Anonyme, Winterthur, Switzerland, a corporation of Switzerland
Application October 14, 1953, Serial No. 386,096
Claims priority, application Switzerland October 18, 1952
6 Claims. (Cl. 75—128)

1. A heat-resisting austenitic steel alloy particularly suitable for casting articles capable of withstanding severe mechanical stress at high temperatures, said steel alloy containing, a ferrous base, essentially 0.05 to 0.45 percent carbon, 16 to 27 percent chromium, 10 to 30 percent nickel, a total of 6 to 8 percent molybdenum, tungsten and columbium/tantalum, the three last named constituents being present in the following proportions: 2.2 to 3.8 percent molybdenum; 1.2 to 2.8 percent tungsten;

0.2 to 1.8 percent columbium/tantalum, and a total of 6 to 12 percent cobalt and manganese in substantially equal amounts, and incidental impurities.

---

2,772,156
SILVER ALLOYS
Charles L. Prisznar, Nutley, N. J., assignor to The Ventura Corporation, Newark, N. J., a corporation of New Jersey
No Drawing. Application August 30, 1955, Serial No. 531,593
5 Claims. (Cl. 75—173)

1. An homogeneous silver alloy having substantially the color of pure silver, said alloy being characterized by improved tensile strength, hardness and elasticity, and being more resistant to staining, corrosion, and tarnishing than is pure silver, comprising the following ingredients within the ranges indicated based on percentages by weight:

| | |
|---|---|
| Silver | 91.77–93.27 |
| Manganese | 3.60–4.40 |
| Copper | 2.38–2.90 |
| Tin | 0.45–0.55 |
| Zinc | 0.15–0.19 |
| Nickel | 0.15–0.19 |

---

2,772,157
PRODUCTION OF MIXED FIBROUS SHEET MATERIAL
Osborn H. Cilley and Robert L. Moore, Manheim, Pa., and Lester J. Novak, Trumbull, Conn., assignors to Raybestos-Manhattan, Inc., Passaic, N. J., a corporation of New Jersey
No Drawing. Application March 16, 1953, Serial No. 342,724
8 Claims. (Cl. 92—3)

1. A smooth water-laid felted fibrous sheet comprised of the dried residue of an alkaline colloidal dispersion of chrysotile asbestos fibers, said sheet including individualized cut glass yarn fibers substantially uniformly distributed therethrough, the glass fibers carrying a wettable, water-insoluble, strongly adherent hardened organic film coating.

7. The method of forming a smooth strong sheet composed of a substantially homogeneous mixture of asbestos fibers and from about 1% to about 75% of glass fibers by weight of the composite, which comprises mixing glass filaments of less than about 10 microns in diameter and from about ⅛ to about 1 inch in length derived from cut glass yarn and carrying a wettable, water-insoluble, strong adherent hardened organic film coating, with an aqueous alkaline colloidal dispersion of chrysotile asbestos fibers containing organic chrysotile asbestos colloidizing agent to form a slurry having a viscosity of from about twice to about eight times that of water to thereby stably suspend said glass filaments therein and to uniformly distribute the fibers with each other in an individualized manner, and then felting said fibers on a foraminous carrier of a paper making machine.

---

2,772,158
PHOTOGRAPHIC METHOD USING A LIGHT SENSITIVE RESIN COMPOSITION
Stanley B. Elliott, Shaker Heights, Ohio, assignor to Ferro Corporation, Cleveland, Ohio, a corporation of Ohio
No Drawing. Application February 18, 1953, Serial No. 337,661
9 Claims. (Cl. 96—27)

1. The process of making photographic images which consist of selectively exposing a photosensitive film to a light image in such a manner as to create a light intensity gradient such that dye area receiving maximum actinic light is exposed to at least two milliwatts per square centimeter for at least one-thousandth of a second, said film consisting of an intimate admixture of: (*a*) An organic halogenated vinyl resin having a molecular weight of at least 6,000; and (*b*) From about 0.1% to about 25% of the weight of said resin of a substance selected from the class consisting of the oxides, zinc and cadmium, metal salts of halogen free inorganic acids, and metal salts of carboxylic acids, the metals therein being selected from the class consisting of aluminum, zinc, tin, titanium, zirconium, beryllium, cadmium, bismuth, iron and antimony, and thereafter fully developing and fixing the image solely by submitting said film to a temperature of from about 200° F. to about 500° F. for a period of about 1 to about 60 minutes.

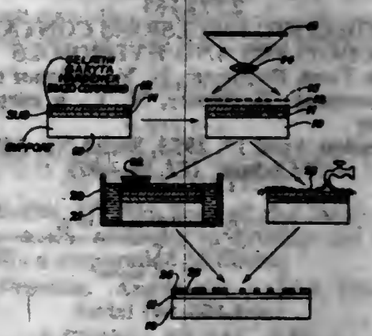
LIGHT SENSITIVE COMPOSITION OF MATTER AND PHOTOGRAPHIC METHOD USING IT
Stanley B. Elliott, Shaker Heights, Ohio, assignor to Ferro Corporation, Cleveland, Ohio, a corporation of Ohio
No Drawing. Application February 18, 1953, Serial No. 337,662
18 Claims. (Cl. 96—27)

1. A composition of matter consisting of an intimate admixture of:



(*a*) An organic halogenated vinyl resin having a molecular weight of at least 6,000;

(*b*) From about 0.1% to about 25% of the weight of said resin of a substance selected from the class consisting of the oxides of zinc and cadmium, metal salts of halogen free inorganic acids, and metal salts of carboxylic acid, the metals therein being selected from the class consisting of aluminum, zinc, tin, titanium, zirconium, beryllium, cadmium, bismuth, iron and antimony; and

(*c*) From about 1% to about 25% of the weight of said resin of a sequestering agent selected from the class consisting of silver carbonate, silver oxide, silver phosphate, silver naphthenate, silver acetate, silver cumate, silver octoate, silver compounds of phenols, silver compounds of mercaptans, and the silver salt of 2-hydroxy 1,4 naphthoquinone.

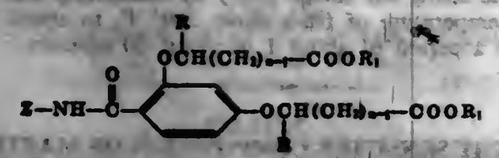
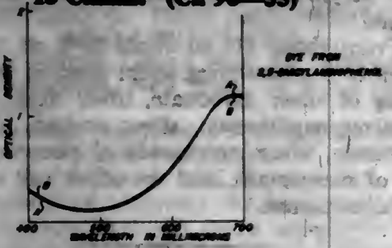
LIGHT-DETACHED RESISTS OR RELIEFS FOR PRINTING PLATES
Martin Hepher, Harrow, England, assignor to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey
Application March 21, 1952, Serial No. 277,836
19 Claims. (Cl. 96—35)



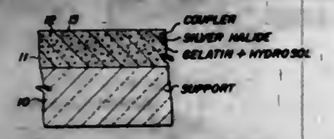
1. A photosensitive sheet comprising a support and a layer on the support made up of gelatin containing sufficient acid to have a pH below 2.5, between 0.1 percent and 2 percent chrome alum and a diazo derivative of the compounds selected from the group consisting of

p-Phenylenediamines, and
4,4'-diamino diphenylmethanes



2,772,161
**PHOTOGRAPHIC EMULSIONS AND NEW COUPLING COMPOUNDS**
Anthony Loria and Edward T. Peech, Rochester, N. Y., assignors to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey
No Drawing. Application October 14, 1954, Serial No. 462,364
11 Claims. (Cl. 96—55)

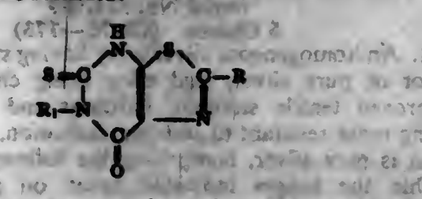
1. A photographic silver halide emulsion containing a compound selected from those represented by the following general formula:



wherein R represents a member selected from the group consisting of a hydrogen atom and an alkyl group, $R_1$ represents a member selected from the group consisting of a hydrogen atom, a methyl group, and an alkali metal atom, $n$ represents a positive integer of from 1 to 2, and Z represents an aromatic radical having substituted thereon a radical which couples with the oxidation product formed during color development.

2,772,162
**DIACYLAMINOPHENOL COUPLERS**
Samuel F. Salminen and Charles R. Barr, Rochester, N. Y., assignors to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey
Application November 3, 1954, Serial No. 466,570
15 Claims. (Cl. 96—55)

1. The method of producing a cyan photographic image in silver halide emulsion layer, which comprises exposing the layer and developing it with a primary aromatic amino developing agent in the presence of a 2,5-diacylaminophenol coupler compound, in which the acyl is derived from carboxylic acid.



2,772,163
**PHOTOGRAPHIC EMULSIONS CONTAINING COUPLERS AND HYDROSOLS**
Lee Kuri Jan Tong, Rochester, N. Y., assignor to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey
Application April 17, 1953, Serial No. 349,348
7 Claims. (Cl. 96—97)

1. A color-forming photographic emulsion comprising a gelatino-silver halide emulsion continuous phase containing in said gelatin continuous phase a coupler compound capable of coupling with the oxidation product of a primary aromatic amino developing agent and also in said gelatin continuous phase a hydrosol of a water-insoluble synthetic polymer made by emulsion polymerization, said polymer including at least an ester of an acrylic acid with an aliphatic alcohol having not more than 10 carbon atoms.

2,772,164
**PHOTOGRAPHIC SILVER HALIDE EMULSIONS CONTAINING 1-THIA-3,5,7-TRIAZAINDENES**
Charles F. H. Allen and John J. Sagura, Rochester, N. Y., assignors to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey
No Drawing. Application January 3, 1955, Serial No. 479,683
6 Claims. (Cl. 96—109)

1. A photographic silver halide emulsion containing an antifoggant selected from those represented by the following general formula:

wherein R represents a member selected from the group consisting of an alkylmercapto group containing from 1 to 3 carbon atoms and a monoalkylamino group containing from 1 to 2 carbon atoms and $R_1$ represents a member selected from the group consisting of a hydrogen atom and a lower alkyl group of the formula $C_nH_{2n+1}$ wherein $n$ is a positive integer of from 1 to 2.

2,772,165
**METHOD OF MAKING A SILVER HALIDE EMULSION**
Jerome Albert Moede, New Brunswick, N. J., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware
No Drawing. Application May 11, 1953, Serial No. 354,610
9 Claims. (Cl. 96—114)

1. A process which comprises admixing, in any order, an aqueous dispersion of light-sensitive silver halide in a water-permeable amphoteric protein protective colloid and an aqueous solution containing from 3% to 20% by weight, based on said colloid, a water-soluble, acid-soluble organic polymer of high molecular weight taken from the group consisting of polyvinyl acetals, alkylvinyl ether/maleic anhydride copolymers, polygalactans and phosphates of polyglycidyl methacrylates containing a plurality of recurring oxy groups selected from the group consisting of ether, acetal, and alcoholic hydroxyl groups and recurring groups taken from the class consisting of free acid groups and their alkali metal and ammonium salts, said polymer being soluble both in water and 1% nitric acid to the extent of at least 1%, by weight, and being capable of forming a complex with an amphoteric protein colloid below its isoelectric point, admixing an acid to lower the pH below the isoelectric point of such colloid thereby forming a complex of the polymer and said colloid and recovering the percipitated complex of said polymer and colloid containing dispersed silver halide.

2,772,166
**HYDROPHILIC COMPOSITIONS AND THEIR PREPARATION**
William F. Fowler, Jr., Rochester, N. Y., assignor to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey
No Drawing. Application February 11, 1953, Serial No. 336,431
10 Claims. (Cl. 96—114)

7. A photographic emulsion composition which comprises silver halide carried by a composition comprising an aqueous colloidal dispersion of photographic grade gelatin and the hydrosol resulting from the emulsion polymerization of a mixture, the major ingredients of which are (A) 1 part of a monomer selected from the group consisting of styrene, acrylonitrile, alkylated styrenes, halogenated styrenes, cyano styrenes, nitro styrenes, amino styrenes, halogenated acrylonitriles, and vinylidene cyanide, (B) 1½–5 parts of an ester selected from the group consisting of the alkyl acrylates, the alkyls of which are of 2–10 carbon atoms and the alkyl methacrylates of alkyls of 4–10 carbon atoms and (C) at least 1% and not more than approximately 8% of acrylic acid, based on the total weight of monomer.

2,772,167
**DIETARY SUPPLEMENT**
Horace W. Diamond, Flossmoor, Ill., and Robert L. Frank, Lake Geneva, Wis., assignors to Morton Salt Company, Chicago, Ill., a corporation of Illinois
No Drawing. Application October 12, 1953, Serial No. 385,686
3 Claims. (Cl. 99—2)

1. An iodine-source material adapted for use as an animal feed supplement comprising cuprous iodide and sodium chloride.

2,772,168
**FERMENTABLE CARBOHYDRATE FOOD PRODUCTS**
William James Kline, River Edge, N. J., assignor to Colgate-Palmolive Company, a corporation of Delaware
No Drawing. Application November 28, 1951 Serial No. 258,759
27 Claims. (Cl. 99—23)

1. An improved food preparation comprising a fermentable carbohydrate food in an amount normally tending to produce acid therefrom in the oral cavity and having incorporated therein a minor amount of a higher fatty acid amide of an amino carboxylic compound to inhibit acid production from said fermentable carbohydrate.

2,772,169
**ANTIOXIDANT MATERIAL AND USE OF SAID MATERIAL IN TREATING MEAT**
Lloyd A. Hall, Chicago, Ill., assignor to The Griffith Laboratories, Inc., a corporation of Illinois
No Drawing. Application January 6, 1956, Serial No. 557,649
10 Claims. (Cl. 99—159)

1. In the curing of meat, the step of adding, in the presence of nitrite salts, an effective amount of an antioxidant composition comprising 1.5 to 7.5 parts by weight of a gallic ester, 1.5 to 7 parts by weight of ascorbic acid, and 12 to 40 parts by weight of phospholipoid.

2,772,170
**ANTIOXIDANT COMPOSITION**
Lloyd A. Hall, Chicago, Ill., assignor to The Griffith Laboratories, Inc., a corporation of Illinois
No Drawing. Application November 23, 1953, Serial No. 393,948
11 Claims. (Cl. 99—163)

1. An antioxidant composition comprising a clear solution in an edible oil of fatty monoglyceride citrate, propyl gallate and about 0.5 to 2.5% of added water.

2,772,171
**METHOD OF PACKAGING CAKE MIX AND FROSTING THEREFOR**
Henry P. Mesenzny, Arlington, Mass.
No Drawing. Application October 17, 1955, Serial No. 541,068
1 Claim. (Cl. 99—172)

The method of preparing a packaged cake mix and frosting therefor including separate packages of cake mix and frosting mix combined in a single outer container, whereby the consumer may add milk, fresh shell eggs, and selected flavoring in desired proportions to said cake mix to produce a resulting cake mixture suitable for baking, and whereby said consumer may add milk, butter and selected flavoring in desired proportions to said frosting mix to produce a suitable frosting for a baked cake product, comprising the steps of mixing together approximately 5 to 8 parts of an emulsifier type of shortening, approximately 10 parts of cake flour, approximately 12 to 17 parts of granulated sugar and approximately 1 part salt-baking powder mixture to produce a cake mix, inserting said cake mix in a container to provide a first package, mixing together approximately 1 to 2 parts of a bland shortening and approximately 7 to 9 parts of powdered sugar to produce a frosting mix, inserting said frosting mix in another container to provide a second package, and enclosing said first and second packages in said outer container.

2,772,172
**FILM FOR PACKAGING MEATS**
Clarence M. Carson, Cuyahoga Falls, Ohio, assignor, by mesne assignments, to The Goodyear Tire & Rubber Company, a corporation of Ohio
No Drawing. Application August 29, 1951, Serial No. 244,255
7 Claims. (Cl. 99—174)

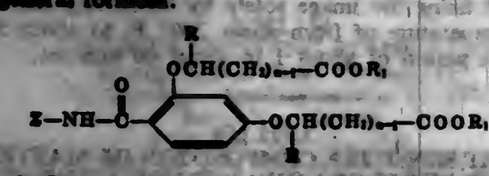
1. The method of preserving the red color of freshly cut red meat due to the red blood therein while preventing formation of methemoglobin therein which comprises wrapping the meat in a single ply of transparent film between .0005 and .0012 inch thick, consisting essentially of 25 to 40 parts of ester plasticizer and 100 parts rubber hydrochloride which is coated on the surface adjacent the meat with a hydrophilic material to prevent fogging, which film has a water-proof transfer rate between ten and twenty five grams, and an oxygen-diffusion rate of at least substantially 200 cubic centimeters.

2,772,173
**SYNTHETIC WAX MATERIALS AND METHOD OF PREPARING THE SAME**
Elias Fischer, Chicago, Ill., assignor to Armour and Company, Chicago, Ill., a corporation of Illinois
No Drawing. Application October 24, 1952, Serial No. 316,811
8 Claims. (Cl. 106—10)

1. A composition capable of providing hard, non-smearing films, consisting essentially of an emulsion of water, an emulsifying agent and salts of a tertiary diethanol amine having an alkyl group containing from 12 to 22 carbon atoms and fatty acid material of which a major portion represents saturated fatty acid selected from the group consisting of fatty acids and monohydroxy fatty acids and having from 14 to 22 carbon atoms.

2,772,174
**CORROSION INHIBITING PAINTS AND METHOD OF PREPARATION**
Werner L. Riegler, Western Springs, and James G. Atherton, Chicago, Ill., assignors to Armour and Company, Chicago, Ill., a corporation of Illinois
No Drawing. Application April 8, 1954, Serial No. 421,946
6 Claims. (Cl. 106—14)

1. A paint composition for metal surfaces having incorporated therein from ¼ to 2½ weight percent, based upon the amount of pigment, of a salt of a fatty acid having from 8 to 22 carbon atoms and a diamine having the general formula:



$$R—NH—(CH_2)_x—NH_2$$

wherein R is an aliphatic hydrocarbon radical having from 8 to 22 carbon atoms and $x$ is an integer of from 2 to 10.

No Drawing. Application April 8, 1954, Serial No. 421,946
6 Claims. (Cl. 106—14)

1. A paint composition for metal surfaces having incorporated therein from ¼ to 2½ weight percent, based upon the amount of pigment, of a salt of a fatty acid having from 8 to 22 carbon atoms and a diamine having the general formula:

$$R—NH—(CH_2)_x—NH_2$$

wherein R is an aliphatic hydrocarbon radical having from 8 to 22 carbon atoms and $x$ is an integer of from 2 to 10.

2,772,175

## STENCIL DUPLICATING INKS

Julian Lee Beatty, Northbrook, and Robert Thompson Florence, Park Ridge, Ill., assignors to A. B. Dick Company, Niles, Ill., a corporation of Illinois

No Drawing. Application April 2, 1952, Serial No. 280,206

6 Claims. (Cl. 106—26)

1. A stencil duplicating ink consisting essentially of water as the diluent, a tinctorial agent present in amounts within the range of 3–15% by weight of the ink composition and 0.5–15% by weight of a bodying agent for imparting the desired viscosity to the ink composition and for functioning as an adherent base upon drying consisting of a water soluble polyvalent metal ammonium colloid complex characterized by substantial insolubility upon release of the ammonium component upon drying and in which the colloid of which the complex is formed is selected from the group consisting of polysaccharides, proteins, natural resins, polyalkyl acrylates in which the alkyl group contains from 1–4 carbon atoms, cellulose ethers and cellulose esters.

2,772,176

## STOPPER HEADS

Carl F. Leitten, Hamburg, N. Y., assignor to Electro Refractories & Abrasives Corporation, Buffalo, N. Y.

No Drawing. Application March 4, 1953, Serial No. 340,380

4 Claims. (Cl. 106—56)

1. A raw mix for the manufacture of stopper heads, said mix consisting of from 15 to 50% by weight of a plastic refractory clay, 15 to 50% by weight of refractory clay grog and from 12 to 20% by weight of flake graphite and comprising from 12 to 20% by weight of fused silica.

2,772,177

## SILICATE GLASS ADHESIVE

James G. Lander, Painesville, Ohio, assignor to Diamond Alkali Company, Cleveland, Ohio, a corporation of Delaware

No Drawing. Application September 22, 1952, Serial No. 310,921

2 Claims. (Cl. 106—79)

1. A composition of matter comprising:

| | Percent |
|---|---|
| Aqueous silicate glass solution ($Na_2O:SiO_2$ ratio, 1:2.5–4, 35–45% solids) | 75–85 |
| Urea | 2–10 |
| Sugar | 0.5–3 |
| Sodium bichromate | 0.1–1 |
| Magnesium sulfate | 1–4 |
| Barden clay | 0–8 |
| Water | Balance to 100 percent |

2,772,178

## PROCESS FOR PREPARING A COLD WATER SOLUBLE DEXTRIN ADHESIVE AND THE PRODUCT THEREOF

Walter G. Kunze and Raymond B. Evans, Catonsville, Md., and John W. Huebschmann, Decatur, Ill., assignors to National Starch Products Inc., New York, N. Y., a corporation of Delaware

No Drawing. Application December 11, 1953, Serial No. 397,782

5 Claims. (Cl. 106—208)

1. A process for preparing a cold water soluble dextrin adhesive which comprises adding to dextrin about 15 to 75%, by weight of the dextrin, of water to moisten the dextrin, and 7 to 30% of an inorganic alkaline salt, thereafter sintering the mixture into a dried material at temperatures below the caramelization temperature of the dextrin.

2,772,179

## ASPHALT COMPOSITIONS

Mathew L. Kalinowski, Chicago, and Lowell T. Crews, Homewood, Ill., assignors to Standard Oil Company, Chicago, Ill., a corporation of Indiana

No Drawing. Application July 30, 1954, Serial No. 446,964

10 Claims. (Cl. 106—273)

1. The process of preparing an additive suitable for use in bitumen coating material, which process comprises reacting in a reaction zone for a period of time of from about ¼ to about 1.0 hour at a temperature within the range of from about 180° F. to about 240° F. a mixture of polyamines having from 2 to about 6 amino groups per polyamine molecule, said mixture consisting essentially of at least 75% by weight of at least one alkylene polyamine containing at least one primary amino group and from about 5% to about 25% by weight of at least one alkyl-substituted alkylene polyamine characterized by having no primary amino group in the molecules of said alkyl-substituted alkiene polyamine, with "Ebony Fat," which "Ebony Fat" is characterized as the propane-insoluble residue obtained in the solvent extraction of a crude fatty material selected from the class consisting of crude animal fats, fatty oils, and fatty acids, crude vegetable fats, fatty oils, and fatty acids, and mixtures thereof with liquified propane, said insoluble residue being insoluble in 6 to 30 volumes of propane at a temperature of from about 140° F. to about 190° F. and constituting from about 0.2% to about 10% of the crude fatty material from which said insoluble residue is extracted, the total alkylene polyamines in said reaction zone being in exces of the stoichiometric requirement for reaction with the "Ebony Fat" in said reaction zone.

9. A roadway construction material comprising mineral aggregates admixed with a coating composition consisting essentially of a major proportion of a normally liquid bitumen and from about 0.25% to about 5.0% of a heat-stable reaction product obtained by reacting "Ebony Fat" with a mixture of alkylene polyamines having from 2 to about 6 amino groups per molecule and consisting essentially of at least one alkylene polyamine having at least one primary amino group in an amount of at least 75% by weight of said mixture of alkylene polyamines and from about 5% to 25% by weight of at least one alkyl-subetituted alkylene polyamine containing no primary amino group, at a temperature within the range of from about 180° F. to about 240° F. for a period of time of from about one-quarter hour to about one hour.

2,772,180

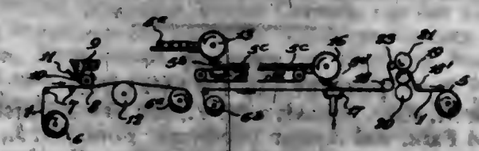
## PARTING COMPOSITIONS IN METAL MANUFACTURING

Robert Milton Neel, Madison County, Ill., and Oliver L. Niehouse, New York, N. Y., assignors to Olin Mathieson Chemical Corporation

No Drawing. Application June 28, 1952, Serial No. 296,262

7 Claims. (Cl. 106—286)

1. As a new composition of matter, a parting material suitable for sandwiching between face to face surfaces of superposed pressure weldable metal sheets for preventing welding of the sheets in those areas separated thereby during pressure welding, the solid constituents of which consist essentially of particles of colloidal graphite and particles of calcium carbonate in the ratio of from about 5 to about 13 parts to from about 40 to about 75 parts respectively.



2,772,181

## COATED WEB PRODUCT AND METHOD OF MAKING SAME

Sedgwick C. Rogers, Appleton, and Kenneth J. Harwood, Neenah, Wis., assignors, by mesne assignments, to Kimberly-Clark Corporation, a corporation of Delaware

Application October 11, 1952, Serial No. 314,244

11 Claims. (Cl. 117—9)

8. A method of forming a web product comprising the steps of forming a stable dispersion of finely divided particles of polyvinyl chloride resin in dioctyl phthalate, said dispersion having a viscosity within the range of 2900 to 16,000 centipoises, said dispersion containing 42 to 46 parts by weight of polyvinyl chloride resin, applying said dispersion over at least a portion of the surface of a thread web, heating said thread web having said dispersion thereon to a temperature of between 240 to 295° F. to only partially fuse said polyvinyl chloride resin in said dioctyl phthalate and thereby solidify said dispersion on the threads of said web without substantial impregnation of resin within said threads, depositing an applique of separated fibers on the surface of said web having said solidified dispersion thereon, reheating said fiber containing web to a temperature of between 265 and 320° F. to soften said dispersion and to cause further fusion of said resin, and calendering said fiber containing web while in said heated condition to bring the web and applique into intimate contact with said dispersion whereby the web and applique are embedded in said dispersion, said reheating being insufficient to completely fuse said polyvinyl chloride resin whereby said dispersion remains solidified on the surface of the threads of said web without substantial impregnation of resin within said threads.

2,772,182

## CERAMIC DECORATION METHOD

Christian C. Jensen, Perth Amboy, N. J., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application May 13, 1950, Serial No. 161,903

9 Claims. (Cl. 117—49)

8. A method of decorating a ceramic object comprising applying to said object a squeegee print of a hot-melt type decorating composition while maintaining said composition at a temperature within the range 120 to 230° F. and while said object is at a temperature at least 15° F. below the melting temperature of said composition, whereby a solid, firm print is formed instantly upon contact of said composition with said object and superimposing on said print a squeegee print of an air-dry type decorating composition, and then firing said object to fuse the decoration thereto, said hot-melt composition being nonvolatile and solid at normal temperature and comprising a dispersion of a ceramic decoration, in a vehicle in the proportion of 2 to 6 parts by weight of said ceramic decoration per part of said vehicle, said vehicle containing: (*a*) 30 to 80% of a material which melts within the temperature range 120 to 230° F. and is from the group consisting of waxes, mixtures of waxes, and mixtures of a wax with a material from the group consisting of palmitic acid, stearic acid and solid soaps; (*b*) 14 to 68% of a material from the group consisting of rosin and abietic acid, rosin esters and esters of abietic acid, polymerized rosin and polymerized abietic acid, hydrogenated rosin and hydrogenated abietic acid, and metal salts of rosin and of abietic acid; (*c*) 1 to 10% of ethyl cellulose; (*d*) 0.5 to 10% of an organic phosphate material from the group consisting of lecithin and phosphorated tall oil; and (*e*) 0 to 1% of pyrogallic acid, said air-dry composition being non-solid at normal temperature and comprising a dispersion of a ceramic decoration in a vehicle in the proportion of 2 to 6 parts by weight of the ceramic decoration per part of the vehicle, the vehicle of said air-dry composition containing: (*f*) 50 to 80% of a volatile solvent the removal of which by drying causes said air-dry composition to solidify; (*g*) 15 to 35% of a material from the group consisting of rosin and abietic acid, rosin esters and esters of abietic acid, polymerized rosin and polymerized abietic acid, hydrogenated rosin and hydrogenated abietic acid, and metal salts of rosin and of abietic acid; (*h*) 0.5 to 7% of ethyl cellulose; and (*i*) 0.5 to 10% of an organic phosphate material of the group consisting of lecithin and phosphorated tall oil.

2,772,183

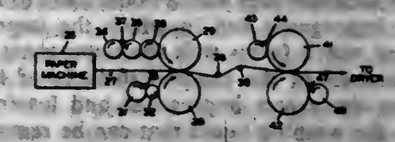
## CHEMICAL NICKEL PLATING PROCESSES

Paul Talmey, Barrington, Ill., and Donald E. Medway, Hammond, and Warren G. Lee, East Chicago, Ind., assignors to General American Transportation Corporation, Chicago, Ill., a corporation of New York

No Drawing. Application September 24, 1953, Serial No. 382,214

21 Claims. (Cl. 117—50)

4. The process of plating with nickel the surface of a body formed essentially of iron, which comprises cleaning and degreasing the surface of said body, soaking said body in an aqueous solution of hydrogen peroxide for a time interval sufficiently long to form only a thin iron oxide film upon the surface thereof and without the formation of any visible rust upon the surface thereof, said solution containing not in excess of about 0.1% by weight of hydrogen peroxide, and then contacting said body with a nickel plating bath of an aqueous solution of a nickel salt in order to effect the displacement deposit of a thin nickel film upon the surface of said body.



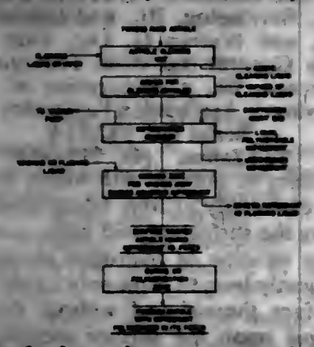
2,772,184

## PAPER COATING

Dexter L. Wolfe and Leroy W. Heel, Appleton, Wis., assignors, by mesne assignments, to Kimberly-Clark Corporation, a corporation of Delaware

Application September 21, 1953, Serial No. 381,256

11 Claims. (Cl. 117—64)



1. The process of coating paper which comprises continuously moving a web of paper, continuously applying to at least one surface of said web a coating composition containing from 35 to 60 percent by weight of solids and including a pigment and a hardenable binder, and relatively soon thereafter and without applying any intermediate drying step so that at least the outermost region of said coating remains in a wet, mobile, moldable state capable of offsetting upon a surface brought to bear upon the outer surface of said coating, contacting the outermost surface of the coating on said web with a pressure member, continuously applying a regulated amount of a liquid immobilizing agent to the surface of said pressure member before it is brought into contact with said coating, said liquid immobilizing agent being capable of almost instantaneously converting the outermost region of said binder to a non-tacky, hardened state, to almost instantaneously convert and render non-adherent and smooth a layer of said coating composition at the outermost surface thereof when said pressure member contacts said coating, said regulated amount of liquid im-

mobilizing agent being insufficient to form a visible bead of the immobilizing agent at the point at which said pressure member first contacts said coating, withdrawing said coated web from pressure contact with said pressure member to produce a paper web which is provided with a smooth, continuous, level coating, the regulated amount of said liquid immobilizing agent being such that a film of such agent is left on said pressure member after said converted coating is withdrawn from said pressure member, and then drying the web and coating without further smoothing during the drying operation.

---

2,772,185
**TREATING SOLID OBJECTS**
Charles B. Dompeter, New York, N. Y., assignor to American Metasol Manufacturing Corporation, a corporation of New Jersey
Application May 15, 1953, Serial No. 355,393
10 Claims. (Cl. 117—102)

1. The method of treating a porous, rigid article having pores opening into an exposed surface to close off such pores from opening into the exposed surface, which method comprises cleaning such of the surface and the pores found not to be clean, and drying the article; immersing the article, for a time sufficient for substantial penetration of impregnant into those pores, in a liquid, organic, polymerizable impregnant that can polymerize to the solid state under appropriate curing conditions without evolution of volatiles and which, while in its liquid state, can penetrate the pores opening into the exposed surface; removing the article from immersion in the impregnant, and washing off impregnant adhering to any exposed surface of it by contacting the adhering impregnant on such surfaces with a liquid inert to the article and to the impregnant and in which the impregnant is insoluble and which forms with the impregnant an emulsion that runs off of the exposed surfaces of the article taking along the excess impregnant and leaving on the article only the washing liquid that can be removed without creating a hazard; removing such liquid and subjecting the thus impregnated article to curing conditions to polymerize to the solid state the impregnant in the pores.

---

2,772,186
**METHOD OF APPLYING AN EPOXY RESIN TO A BASE AND CURING SAID RESIN**
Josef Mellers, Hamburg-Poppenbüttel, and Eberhard Seidel, Hamburg-Eimsbüttel, Germany, assignors to Hartford National Bank and Trust Company, Hartford, Conn., as trustee
No Drawing. Application April 1, 1952, Serial No. 279,936
Claims priority, application Germany June 28, 1951
2 Claims. (Cl. 117—103)

1. A method of applying a thick resinous coating to a shaped article comprising the steps immersing a shaped article in a solvent-free hot coating composition consisting essentially of a molten ethoxyline casting resin, removing the thus coated object from the hot coating composition and cooling said coating at room temperature for a time sufficient to cause said coating to be sufficiently viscous to maintain the form of the shaped object, heating said coated object through a number of increasing temperature ranges starting at a temperature of about 55° C. and ending at a temperature of about 120° C., for a total period of time sufficient to cure said resin, each of said temperature ranges being of a duration insufficient to liquefy said coating.

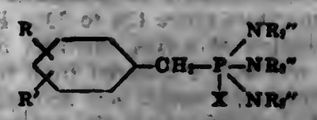
---

2,772,187
**PORCELAIN ENAMELING**
Joseph M. Katz, Brooklyn, N. Y., and Erwin Hurst, Highland Park, and Arthur Jakubczak, Fords, N. J., assignors to General Ceramics Corporation, Keasbey, N. J., a corporation of Delaware
No Drawing. Application June 2, 1954, Serial No. 434,866
2 Claims. (Cl. 117—129)

1. In the process of enameling metal surfaces the steps comprising providing a porcelain enamel slip comprising water as a suspending medium, adding oxgall to the slip, applying a thin layer of the slip to a cleaned metal surface to be enameled and drying and firing said coated product whereby to produce a porcelain enameled metal which is substantially free from the defects of run-off, shiners and blabs.

---

2,772,188
**AMMONIA INSOLUBILIZED METHYLOL-PHOSPHORUS POLYMERS AND CELLULOSIC MATERIALS IMPREGNATED THEREWITH**
Wilson A. Reeves and John D. Guthrie, New Orleans, La., assignors to the United States of America as represented by the Secretary of Agriculture
No Drawing. Application November 18, 1953, Serial No. 393,021
9 Claims. (Cl. 117—136)
(Granted under Title 35, U. S. Code (1952), sec. 266)



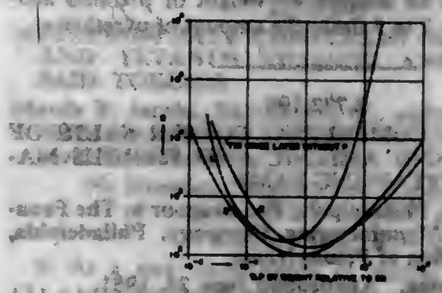
3. A process of insolubilizing a further polymerizable polymer of a mixture of tetrakis(hydroxymethyl) phosphonium chloride and tris(hydroxymethyl) phosphine oxide with a water soluble methylol melamine, said polymer containing at least one free methylol group attached to a phosphorus atom, which comprises reacting said polymer with ammonium hydroxide.

8. The process of claim 3 in which the reaction is effected by impregnating a cellulosic textile with the further polymerizable polymer, drying the wet textile, and impregnating the dried textile with ammonium hydroxide.

---

2,772,189
**TEXTILE MATERIAL WITH AN ANTISTATIC FINISH AND PROCESS OF MAKING SAME**
Oscar P. Cohen, Newton, and Milton J. Scott, Lexington, Mass., assignors to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware
No Drawing. Application August 31, 1951, Serial No. 244,730
13 Claims. (Cl. 117—138.8)

5. A process of treating textile materials comprising at least 10% by weight of a fiber-forming synthetic polymer which comprises applying to said textile materials a solution consisting of a quaternary phosphonium salt having the general formula:



where R and R' are selected from the group consisting of chlorine, bromine and hydrogen atoms and alkyl radicals containing from 1 to 5 carbon atoms, R'' is an alkyl radical containing from 1 to 4 carbon atoms and X is selected from the group consisting of chlorine and bromine atoms and aliphatic monocarboxylate radicals

containing 8 to 24 carbon atoms, and a solvent for said salt, said salt being supplied in an amount sufficient to provide an anti-static finish on said textile materials.

---

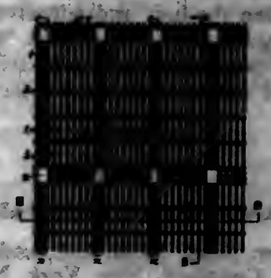
2,772,190
**METHOD OF INCREASING THE ELECTRICAL CONDUCTIVITY OF TIN OXIDE FILMS**
Pieter Willem Haayman, Petrus Cornelis van der Linden, Dirk Vesseaam and Gerardus Hendricus Janssen, Eindhoven, Netherlands, assignors to Hartford National Bank and Trust Company, Hartford, Conn., as trustee
Application September 25, 1952, Serial No. 311,524
Claims priority, application Netherlands November 3, 1951
9 Claims. (Cl. 117—211)

1. In a method of producing transparent electrically conducting films consisting substantially of tin oxide by applying a filming material in fluid form and which comprises an electrically-conducting film-forming compound of tin to a hot vitreous surface, heated to a temperature of at least 300° C.; the step of increasing the electrical conductivity of such films which comprises adding to said filming material, by putting into solution therewith, an amount of a compound of phosphorus to yield an amount of phosphorus not less than about 0.033% to not more than about 12.4% by weight of the tin in said filming material, before applying said filming material to said surface.

---

2,772,191
**PROCESS OF PREPARING NYLON YARN**
Aaron Barkan, Burlington, N. C., assignor, by mesne assignments, to Pabender, Inc., New York, N. Y., a corporation of New York
No Drawing. Application July 13, 1953, Serial No. 367,776
2 Claims. (Cl. 57—157)

1. A process of preparing a markedly lively but uncrimped and uncoiled continuous filament nylon yarn which comprises presetting and subsequently twisting a nylon yarn to impart substantial liveliness and twist torque to said yarn, thereafter sizing said lively, twist torque yarn to subdue temporarily the said liveliness and restrict the action of the torque imparted thereto sufficiently to enable satisfactory knitting of said yarn to produce a stretchable fabric.

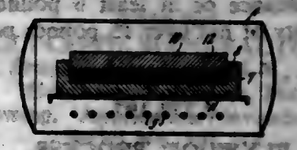


---

2,772,192
**SOLDERING FLUX**
Delbert E. Wobbe, Maywood, and Fred J. Staerwich, Chicago, Ill., assignors to American Can Company, New York, N. Y., a corporation of New Jersey
No Drawing. Application March 14, 1952, Serial No. 276,702
4 Claims. (Cl. 148—23)

3. A method of preparing a liquid soldering flux containing ammonium chloride, urea, monoethanol amine and hydrochloric acid in solution in a major proportion of a volatile alcohol and a minor proportion of water in which the water content is not in excess of 20% by weight of the finished flux comprising, blending the nitrogen containing ingredients, adding from about ⅛ to ½ of the alcohol, acidifying the nitrogen containing ingredients with an excess of concentrated hydrochloric acid and adding the remainder of the volatile alcohol to form a solution of the ingredients.

---

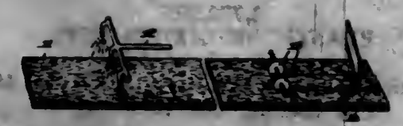


2,772,193
**PLASTIC MODIFIED NETS**
Iwao Ono, Ryuo, Japan
Application September 24, 1954, Serial No. 458,096
8 Claims. (Cl. 154—54)

1. A method of forming an internally compartmented flexible plastic net that comprises arranging a row of flexible thermo-plastic tubes parallel to each other, and internally compartmenting said tubes and simultaneously interconnecting the same to form a net by flattening and welding together spaced regions intermediate the lengths of said tubes by the application of heat and pressure to such spaced regions leaving the tubes separate from each other between such spaced regions.

---

2,772,194
**METHOD OF APPLYING VINYL PLASTISOL LAYERS TO CURED CELLULAR RUBBER**
Jack C. Fisher, Mishawaka, and Lucian P. Demmon, South Bend, Ind., assignors to United States Rubber Company, New York, N. Y., a corporation of New Jersey
Application October 29, 1953, Serial No. 389,048
3 Claims. (Cl. 154—100)



1. The method which comprises coating a portion of a body of cured cellular rubber, said rubber being selected from the group consisting of natural rubber, rubbery butadiene-styrene copolymer, rubbery butadiene-acrylonitrile copolymer, butyl rubber, and polymer of 2-chlorobutadiene, with a plastisol comprising polyvinyl chloride and plasticizer therefor, placing the thus-coated body in an atmosphere of gas at a temperature of 300° F. to 450° F. for a period of time sufficient to fuse the plastisol coating but not substantially in excess of such time, during said last-mentioned step insulating the uncoated portion of said body from the heat with heat insulating means other than said plastisol, the plastisol serving as a heat-protective shield for the portion of said body coated therewith, said plastisol and said insulating means thereby preventing the temperature in substantially the entire body of said cellular rubber core from exceeding 200° F., the temperature on the outer surface of said plastisol in excess of 200° F. during the fusion of said plastisol.

---

2,772,195
**FILTER AND METHOD OF MAKING SAME**
Herbert M. Gaarder, Chicago, Ill., assignor to Wilson & Co., Inc., a corporation of Delaware
Application April 8, 1952, Serial No. 281,289
16 Claims. (Cl. 154—101)

1. The method of forming a hair filter of substantially uniform texture from short hairs comprising the steps of

forming the hairs into layers, placing such layers in juxtaposition to form a filter-body, providing thermoplastic adhesive between the juxtaposed layers, steaming the

filter-body to soften the hair and adhesive and to secure uniformity of distribution of the hairs, and drying and cooling the filter-body to set the adhesive and bond the adjacent layers of said batt to one another.

---

2,772,196

## SHOE SOLE AND METHOD OF MAKING SAME

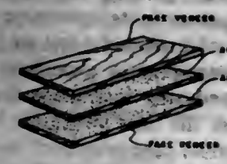
Robert W. Pooley, South Bend, Ind., assignor to United States Rubber Company, New York, N. Y., a corporation of New Jersey

Application May 21, 1954, Serial No. 431,479

10 Claims. (Cl. 154—106)

1. A new article of manufacture comprising a flexible, resilient laminate of a closed-cell, expanded, vulcanized, fused mixture of a thermoplastic vinyl resin, a high-boiling organic liquid plasticizer therefor and a butadiene-acrylonitrile rubbery copolymer, said laminate comprising a plurality of parallel juxtaposed differently colored layers of said mixture integrally bonded together at their interfaces, said layers forming sharp straight lines of demarcation therebetween at exposed surfaces of said laminate transverse to said layers, all of said layers having a compressive resistance of at least 6 pounds per square inch and a density of not over 15 pounds per cubic foot.

---



2,772,197

## PLYWOOD PROCESS

Stanley E. Kambushe, Palmer, Mass., assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

Application July 2, 1954, Serial No. 441,169

3 Claims. (Cl. 154—133)

1. A process for preparing plywood from a plurality of veneers using a thermosetting adhesive based on 100 parts of a urea-formaldehyde condensate modified with from 5 to 20% by weight based on the urea-formaldehyde condensate of a melamine-formaldehyde condensate, which comprises spreading the adhesive on the veneers, assembling the veneers, maintaining said assembled veneers at 20 to 35° C. without pressure for from 15 to 24 hours and then pressing the assembled veneers under heat and pressure.

2,772,198

## METHOD OF KILLING FLIES WITH COMPOSITION COMPRISING PYRETHRINS AND p-AMINOAZOBENZENE

Carl W. Smith, Evanston, Ill., and Norman W. Tompkin, Hammond, Ind., assignors to Standard Oil Company, Chicago, Ill., a corporation of Indiana

No Drawing. Application November 8, 1954, Serial No. 467,624

2 Claims. (Cl. 167—24)

1. The method of killing flies which comprises spraying a fly-infested area with a composition comprising a refined mineral oil containing about .02 to 2 weight per cent of pyrethrins based on total composition which composition contains an amount by weight of p-amino azobenzene which is .2 to 5 times the amount of pyrethrins.

---

2,772,199

## COMPOSITION COMPRISING COPPER SALTS OF FLUORINE AND ARSENIC AND FIBROUS MATERIALS CONTAINING SAME

Murray Zabban, Philadelphia, Pa., assignor to The Pennsylvania Salt Manufacturing Company, Philadelphia, Pa., a corporation of Pennsylvania

No Drawing. Application June 29, 1951, Serial No. 234,677

13 Claims. (Cl. 167—38.5)

1. A water-soluble biocidal composition consisting essentially of sodium carbonate, ammonium chloride, and at least one copper salt of the group consisting of copper fluoride, copper arsenate, and copper arsenite and mixtures of soluble salts that will form these copper salts there being present in said composition at least 6 mols sodium carbonate and 6 mols ammonium chloride for each mol of copper salt.

---

2,772,200

## COMPOSITION CONTAINING COPPER SALTS OF FLUORINE AND ARSENIC FOR PROTECTING WOOD AND OTHER FIBROUS MATERIALS

Murray Zabban, Philadelphia, Pa., assignor to The Pennsylvania Salt Manufacturing Company, Philadelphia, Pa., a corporation of Pennsylvania

No Drawing. Application June 29, 1951, Serial No. 234,678

10 Claims. (Cl. 167—38.5)

1. A composition consisting essentially of a substantially concentrated aqueous solution of ammonium hydroxide (about 28% $NH_3$) at least one pesticide of the group consisting of copper fluoride, copper arsenate, and copper arsenite, and a stabilizer of the group consisting of ammonium carbonate, ammonium chloride, ammonium nitrate, ammonium sulfate, ammonium bromide and ammonium iodide, these being present in said composition in about 1 part by weight of copper pesticide for each 2 parts by weight concentrated ammonium hydroxide and at least 3 mols of stabilizer for each mol of copper pesticide present.

---

2,772,201

## RECOVERING DIPHTHERIA AND TETANUS TOXOIDS

Howard Tint, Philadelphia, Pa., assignor to American Home Products Corporation, New York, N. Y., a corporation of Delaware

No Drawing. Application February 18, 1953, Serial No. 337,687

6 Claims. (Cl. 167—78)

1. In a method of recovering a toxoid selected from the group consisting of tetanus and diphtheria toxoids in

concentrated and purified form from a toxoid-containing broth, the steps comprising adding to said broth a soluble vitreous alkali-metal phosphate having an $M_2O/P_2O_5$ mole ratio lying between 1.0 and 1.66 where M signifies an alkali metal, lowering the pH of the broth to the pH of substantially complete precipitation of toxoid complex, separating from the mixture the precipitate containing the toxoid complex in admixture with undesirable protein complex molecules, equilibrating said precipitate with a non-toxic aqueous solution at the lowest pH of solubility of substantially all of said toxoid complex and separating the solution of the toxoid complex from the mixture.

---

2,772,202

## METAPHOSPHATE COMPLEXES OF DIPHTHERIA AND TETANUS TOXOIDS AND PURIFYING SAID TOXOIDS

Morris B. Jacobs, Bayside, N. Y., assignor to American Home Products Corporation, New York, N. Y., a corporation of Delaware

No Drawing. Application March 15, 1954, Serial No. 416,405

10 Claims. (Cl. 167—78)

6. As a new composition of matter the complex of (1) a toxoid selected from the group consisting of tetanus and diphtheria toxoids with (2) the anion of a soluble vitreous alkali-metal phosphate having an $M_2O/P_2O_5$ mole ratio lying between 1.0 and 1.66, where M signifies an alkali metal, formed by the addition of said phosphate to an aqueous solution of said toxoid.

---

2,772,203

## STABLE DENTAL CREAMS CONTAINING HIGHER ALIPHATIC ACYL AMIDE OF AMINOCARBOXYLIC ACID COMPOUND

Gerhard Martin Salzmann, Franklin Lakes, N. J., assignor to Colgate-Palmolive Company, Jersey City, N. J., a corporation of Delaware

No Drawing. Application April 3, 1952, Serial No. 280,346

9 Claims. (Cl. 167—93)

1. A dental cream comprising (1) a polishing material selected from the group consisting of calcium- and magnesium-containing polishing agents, (2) a substantially saturated aliphatic acyl amide of a saturated aliphatic monoaminocarboxylic acid compound having 2 to 6 carbon atoms, the aliphatic acyl group having about 12 to 16 carbon atoms, and less than about 15% by weight based on said amide of higher fatty acid material, the amount of said material being insufficient to substantially adversely affect said amide, and characterized by (3) a calcium and magnesium ion suppression agent in an amount from about 0.1 to 5% by weight.

---

2,772,204

## DENTAL PREPARATIONS CONTAINING HIGHER ALIPHATIC ACYL SARCOSIDE COMPOUNDS

William James King, River Edge, N. J., assignor to Colgate-Palmolive Company, Jersey City, N. J., a corporation of Delaware

No Drawing. Application September 13, 1954, Serial No. 455,761

3 Claims. (Cl. 167—93)

1. A dental preparation comprising a sarcoside compound selected from the group consisting of N-heptadecanoyl and N-stearoyl sarcoside compounds having less than about 15% based on the weight of said sarcoside of higher fatty acid material, the amount of said material being insufficient to adversely affect said sarcoside.

2,772,205

## DENTAL FLOSS CONTAINING HIGHER ALIPHATIC ACYL AMIDE OF AN AMINOCARBOXYLIC ACID COMPOUND

William James King, River Edge, N. J., assignor to Colgate-Palmolive Company, Jersey City, N. J., a corporation of Delaware

Application September 7, 1954, Serial No. 454,634

5 Claims. (Cl. 167—93)

The terminal portion of the term of the patent subsequent to September 14, 1971 has been disclaimed and dedicated to the public.

1. Dental floss comprising a substantially saturated aliphatic acyl amide of a saturated aliphatic monoaminocarboxylic acid compound having 2 to 6 carbon atoms, the aliphatic acyl group having about 12 to 16 carbon atoms, and less than about 15% by weight based on said amide of higher fatty acid material, the amount of said material being insufficient to substantially adversely affect said amide.

---

2,772,206

## PRODUCTION OF FERMENTATION GLYCEROL

Edward M. Frankel, New York, N. Y., and Samuel L. Goldheim, Baltimore, Md.

No Drawing. Application November 9, 1953, Serial No. 391,111

15 Claims. (Cl. 195—38)

1. Method of manufacturing glycerol by fermentation which comprises fermenting an aqueous sugar solution with yeast in the presence of sodium sulphite-bisulphite, separating the yeast cells from the fermentation liquid, evaporating ethanol and acetaldehyde from the yeast-freed liquid to obtain a residual solution containing glycerol and sodium sulphite, passing said solution through a cationic exchanger thereby to obtain an effluent containing glycerol and sulphurous acid, heating said effluent to drive off sulphur dioxide thereby to obtain a solution of glycerol of high purity.

---

2,772,207

## GLYCEROL MANUFACTURE

Edward M. Frankel, New York, N. Y., and Samuel L. Goldheim, Baltimore, Md.

No Drawing. Application November 9, 1953, Serial No. 391,112

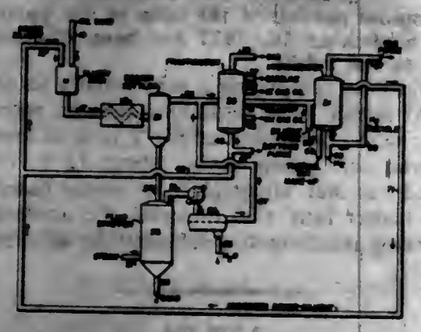
13 Claims. (Cl. 195—38)

1. Method of manufacturing glycerol by fermentation which comprises fermenting an aqueous sugar solution with yeast in the presence of sodium sulphite-bisulphite, separating the yeast cells from the fermented liquid, evaporating ethanol and acetaldehyde from the yeast-freed liquid to obtain a residual solution containing glycerol and sodium sulphite, passing said solution through a polar ion excluding material whereby the glycerol is retained in said ion excluding material and the sodium sulphite-bisulphite emerges with the effluent, and washing the aforesaid material thereby to obtain a solution of glycerol in high purity.

---

2,772,208

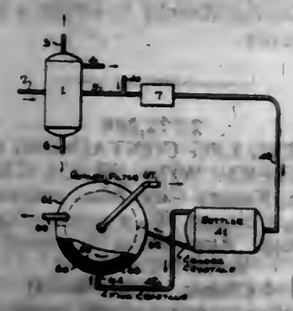
## DEHYDRATING LPG CONTAINING CARBONYL SULFIDE WITH SILICA GEL



Robert J. Ferm, Kansas City, Mo., assignor to Standard Oil Company, Chicago, Ill., a corporation of Indiana

No Drawing. Application December 7, 1954, Serial No. 473,761

4 Claims. (Cl. 196—4)

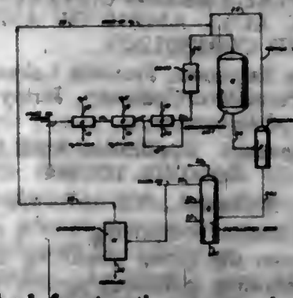


1. A dehydration process which comprises contacting liquified petroleum gas which contains appreciable amounts of carbonyl sulfide and objectionable amounts of dissolved water with a dehydrating agent consisting of silica gel and separating from said silica gel a substantially dehydrated liquified petroleum gas of unchanged carbonyl sulfide content.

2,772,209
**RECOVERY OF OIL FROM BITUMINOUS SANDS**
Joseph Stewart, Cranford, Stewart C. Fulton, Elizabeth, and Arthur W. Langer, Jr., Nixon, N. J., assignors to Esso Research and Engineering Company, a corporation of Delaware
Application July 1, 1953, Serial No. 365,342
3 Claims. (Cl. 196—14)

1. The process of efficiently extracting oil from bituminous sand which comprises breaking up said sand into small particles, forming a liquid slurry of said particles in a liquid hydrogen donor-diluent of boiling range between about 500° and about 700° F., feeding said slurry to a settling and soaking zone, heating said slurry non-catalytically and at a pressure sufficient to prevent loss of volatile ingredients, a maximum of 500 p. s. i. g. to a temperature between about 750° and 900° F., allowing a period of about 10 to 120 minutes for said sand to separate from said oil by phase formation, passing the sand to a stripping zone, fluidizing the sand in said stripping zone with steam to remove residual oil therefrom, separating the residual oil so removed from said steam and passing said residual oil to a fractionation zone along with the oil separated from the sand in the settling and soaking zone, fractionating said oils to obtain gasoline, gas oil, a diluent base fraction, boiling between 500° and 700° F., and a bottoms fraction, bleeding off a portion of said diluent base fraction, adding a thermal tar of similar boiling point from catalytic cracking of a petroleum fraction, partially hydrogenating said combined diluent base fraction and thermal tar by adding 200 to 600 s. c. f. of hydrogen gas thereto under hydrogenating conditions, recycling the partially hydrogenated material to join said slurry, and adding said bottoms fraction thereto.

2,772,210
**SOLVENT DEWAXING PROCESS**
Chester L. Read, Westfield, N. J., assignor to Esso Research and Engineering Company, a corporation of Delaware
Application June 12, 1952, Serial No. 293,183
8 Claims. (Cl. 196—19)

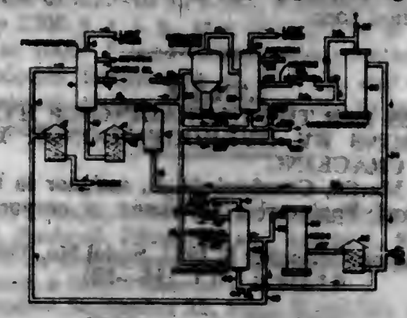


1. Improved process for removing waxy constituents from a wax-bearing oil which comprises adding a solvent to the wax-bearing oil, chilling the same to a temperature at which the waxy crystals precipitate, separating an oil phase comprising the smaller crystals and an oil phase comprising the larger crystals, passing the phase comprising the larger crystals to an initial section of a filtering zone and causing the larger crystals to plate out on the filter cloth, passing the phase containing the smaller crystals to a secondary section of the filtering zone, rotating the cloth containing the larger crystals to said secondary section and causing said smaller crystals to plate out on the larger crystals.

2,772,211
**TREATMENT OF HYDROCARBON STOCKS WITH SODIUM**
Arthur S. Hawkes, Royal Oak, and Donald O. Reuter, Detroit, Mich., assignors to Ethyl Corporation, New York, N. Y., a corporation of Delaware
No Drawing. Application May 28, 1953, Serial No. 358,171
5 Claims. (Cl. 196—26)

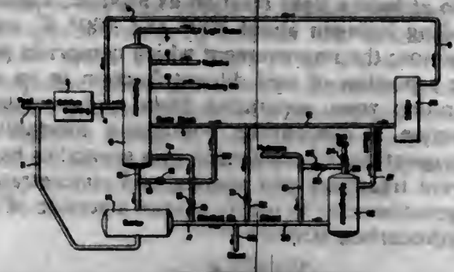
1. A process for treating an essentially anhydrous hydrocarbon stock having gum-forming components and a low sulphur content with a finely-divided metal selected from the group consisting of alkali and alkaline earth metals comprising treating said stock with from 0.25 to 0.5% by weight of said metal based upon the weight of said stock for a period of between about 0.5 to 40 minutes at a temperature from 200 to 500° F.

2,772,212
**PROCESS FOR REMOVING METALS FROM CRUDE OILS AND THEN HYDRODESULFURIZING THE CRUDE OILS**
Wilson D. Seyfried, Baytown, Tex., assignor, by mesne assignments, to Esso Research and Engineering Company, Elizabeth, N. J., a corporation of Delaware
Application June 30, 1954, Serial No. 440,436
2 Claims. (Cl. 196—28)



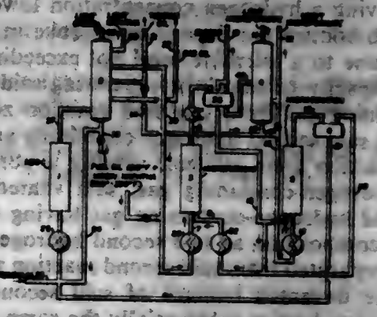
1. In a method for treating a petroleum feed stock to be hydrodesulfurized in a hydrodesulfurization zone in contact with a sulf-active catalyst, said feed stock being selected from the group consisting of crude oils and crude oil fractions containing an appreciable amount of ash forming constituents and acid constituents, including acid constituents selected from the group consisting of naphthenic acids and naphthenic acid salts, the improvement which comprises the steps of water washing said feed stock in sequence in a plurality of water washing zones with fresh water in each of said zones to remove ash forming constituents therefrom, and contacting said water washed feed stock with an aqueous solution containing an alkali metal hydroxide, an alkali metal salt of sulfonic acid and an alkali metal salt of an inorganic acid to remove acid constituents therefrom.

2,772,213
**HYDROCARBON OIL CONVERSION PROCESS BY CATALYSIS AND HYDROGEN DONOR DILUENT NON-CATALYTIC CRACKING**
Herbert G. M. Fischer, Westfield, N. J., assignor to Esso Research and Engineering Company, a corporation of Delaware
Application June 11, 1954, Serial No. 435,993
5 Claims. (Cl. 196—49)



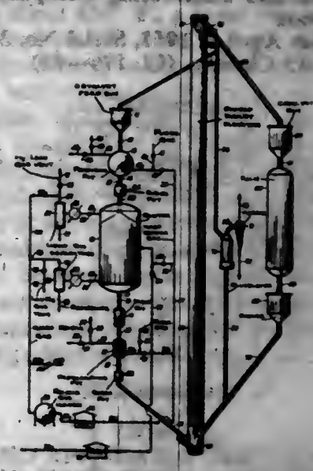
1. A process for converting hydrocarbon oils which comprises catalytically cracking heavy distillate oils in a catalytic cracking zone under catalytic cracking conditions, separating from the effluent therefrom a cycle stock, partially hydrogenating said cycle stock in a hydrogenation zone under hydrogenation conditions to obtain a hydrogen donor diluent, admixing said hydrogen donor diluent with a relatively high boiling heavy oil,

cracking the mixture in a thermal treating zone under non-catalytic hydrogen donor diluent cracking conditions, separating from the thermally treated mixture thermal gas oils including spent hydrogen donor diluent and passing said thermal gas oils to said catalytic cracking zone to form at least a portion of said heavy distillate oils.



2,772,214
**PROCESS FOR HYDROGENATING AND CRACKING PETROLEUM OILS**
Arthur W. Langer, Jr., Nixon, N. J., assignor to Esso Research and Engineering Company, a corporation of Delaware
Application December 24, 1953, Serial No. 400,231
2 Claims. (Cl. 196—49)

1. A hydrocarbon oil conversion process which comprises catalytically cracking a virgin gas oil, separating the cracked product in a separation zone to obtain product hydrocarbons and material boiling above 400° F., partially hydrogenating a portion of said material boiling above 400° F., recombining the hydrogenated portion with another portion of said material boiling above 400° F., converting the recombined mixture in liquid phase under hydrogen donor diluent cracking conditions in the absence of a catalyst, and returning the converted mixture to said separation zone.



2,772,215
**HYDROCARBON OIL CONVERSION PROCESS**
Charles E. Hemminger, Westfield, N. J., assignor to Esso Research and Engineering Company, a corporation of Delaware
Application June 30, 1954, Serial No. 440,389
6 Claims. (Cl. 196—49)

1. A hydrocarbon oil conversion process which comprises reforming in a catalytic reforming zone a heavy virgin naphtha boiling in a range within the ilmits of 200° to 550° F. in the presence of a reforming catalyst and free-hydrogen containing gas to obtain a hydrogen rich gas, naphthas of substantially higher octane and a higher boiling hydrocarbon stream rich in aromatic-naphthenes, reheating and returning a portion of said hydrogen rich gas to said catalytic reforming zone as said free hydrogen containing gas, partially hydrogenating at least a portion of said higher boiling hydrocarbon stream using said hydrogen rich gas as a source of hydrogen to obtain a partially hydrogenated hydrogen donor diluent, admixing 1 volume of residual oil with 1 to 3 volumes of said hydrogen donor diluent, subjecting the resulting admixture to conditions of hydrogen donor

diluent cracking to obtain lighter products including a heavy thermal naphtha boiling in a range within the limits of about 200° to 550° F., and light gas oils and passing said thermal naphtha to said catalytic reforming zone to be reformed therein along with said virgin naphthas, the end boiling points of said virgin and thermal naphthas being adjusted to maintain the proper balance of said hydrogen donor diluent in the process.

2,772,216
**REFORMING AT A PLURALITY OF SEVERITIES WITH CONSTANT RECYCLE GAS OF OPTIMUM HYDROGEN CONCENTRATION TO ALL ZONES**
Kenneth M. Elliott, Woodbury, N. J., assignor to Socony Mobil Oil Company, Inc., a corporation of New York
Application May 1, 1952, Serial No. 285,483
3 Claims. (Cl. 196—50)

1. A method of operating a reforming reactor to produce reformed gasolines of different increased anti-knock rating at maximum capacity while not exceeding the coke combustion rate of the concomitantly operated kiln, which consists essentially in establishing two reaction zones and a kiln, circulating particle-form solid reforming catalyst successively through said reaction zones and said kiln, introducing completely vaporized feed naphtha to be reformed into the first of said reaction zones under given reforming conditions of temperature, pressure and space velocity to produce a first reaction zone effluent comprising a reformed gasoline of given anti-knock rating higher than the anti-knock rating of said feed naphtha and a first hydrogen-containing gas for recycle having a hydrogen concentration in excess of that required to control the deposition of coke in said reaction zone to a tolerable level not exceeding the coke burning capacity of said kiln, simultaneously introducing completely vaporized

feed naphtha to be reformed into the second of said reaction zones under more severe reforming conditions of temperature, pressure and space velocity than the aforesaid given reforming conditions to produce a second reaction zone effluent comprising a reformed gasoline of higher anti-knock rating than the aforesaid given anti-knock rating and a second hydrogen-containing gas for recycle having a hydrogen concentration lower than that required to control the deposition of coke in said second reaction zone to a tolerable level not exceeding the coke-burning capacity of said kiln, separating said first hydrogen-containing gas from said first reaction zone effluent, separating said second hydrogen-containing gas from said second reaction zone effluent, venting a portion of said second hydrogen-containing gas, said vented portion of said second hydrogen-containing gas having substantially the same composition as said second hydrogen-containing gas when separated from said second reaction zone effluent, mixing the unvented balance of said second hydrogen-containing gas having subetantially the same composition as said second hydrogen-containing gas when separated from said second reaction zone effluent with said first hydrogen-containing gas having substantially the same composition as said first hydrogen-containing gas when separated from said first reaction zone effluent to produce a hydrogen-coatining mixed recycle gas having a hydrogen concentration higher than said second hydrogen-containing gas and sufficient to control the coke deposition in both of said reaction zones to a tolerable level not exceeding the coke-burning capacity of said kiln and introducing said hydrogen-containing mixed recycle gas into both reaction zones.

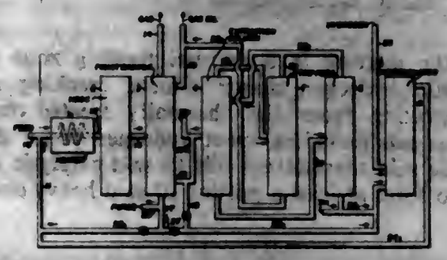
2,772,217

## HYDROFORMING PROCESS

Edward W. S. Nicholson, Baton Rouge, La., assignor to Esso Research and Engineering Company, a corporation of Delaware

Application April 8, 1953, Serial No. 347,523
15 Claims. (Cl. 196—50)

1. In a process for reforming hydrocarbon fractions boiling within the motor fuel range in contact with finely divided hydroforming catalyst particles comprising a group VI metal oxide upon a support in accordance with the fluidized solids technique, the improvement which comprises continuously withdrawing a stream of spent catalyst particles from a reforming reaction zone, regenerating the withdrawn catalyst particles by burning carbonaceous deposits therefrom at elevated temperatures in a separate regeneration zone, withdrawing regenerated catalyst particles from the regeneration zone, mixing reactor catalyst particles with the withdrawn regenerated catalyst in sufficient amount to form a mixture having a temperature below about 1050° F., contacting the mixture of catalyst particles in a pretreatment zone with a hydrogen-containing gas having an inlet water content of about 0.1 to 1.0 mole percent in sufficient quantity to maintain the outlet water content below about 5% maintaining the regenerated catalyst particles in contact with said hydrogen containing gas until they have been substantially freed of water formed by reaction of the regenerated catalyst with hydrogen and recycling the regenerated catalyst particles to the reaction zone.



---

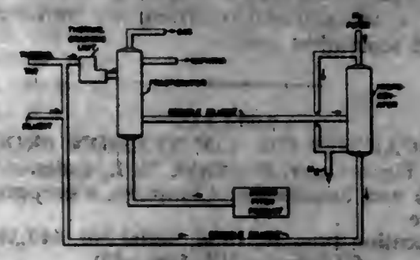
2,772,218

## PROCESS FOR THE UPGRADING OF HYDROCARBONS BY HYDROGEN-DONOR DILUENT CRACKING

Homer Z. Martin, Cranford, N. J., assignor to Esso Research and Engineering Company, a corporation of Delaware

Application December 8, 1953, Serial No. 396,968
4 Claims. (Cl. 196—50)

1. In a process for upgrading heavy hydrocarbonaceous oils which comprises the steps of partially hydrogenating in a hydrogenation zone a recycled hydrocarbon stream obtained as hereinafter described to form a hydrogen donor diluent, admixing said donor diluent with a heavy oil feed and a recycled bottoms fraction, thermally cracking the resulting mixture, and separating the cracked mixture into at least a light fraction as product, a diluent fraction boiling between about 700° and 900° F. and a bottoms fraction; the improvement which comprises passing at least a portion of said diluent fraction to an aromatic separation zone, separating from said portion of diluent fraction a concentrate containing substantially increased proportions of condensed ring aromatics by selective solvent treatment and passing said concentrate to said hydrogenation zone to supply at least a portion of said recycled hydrocarbon stream.



---

2,772,219

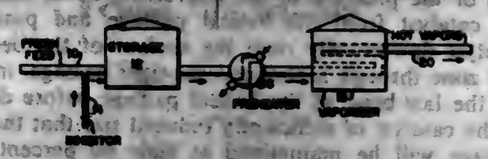
## PRODUCTION OF BINDERS FOR CARBON ELECTRODES FROM PETROLEUM SOURCES

Walter L. Dunkel, Fanwood, and James H. McAteer and Joseph Stewart, Cranford, N. J., assignors to Esso Research and Engineering Company, a corporation of Delaware

Application October 5, 1954, Serial No. 460,521
3 Claims. (Cl. 196—50)

1. A process for preparing a carbonaceous binder for carbon electrodes said binder having a softening point in the range of 70° to 120° C., a hydrogen to carbon atom ratio of less than 1 and less than the feed and a specific gravity of 1.2 to 1.3 which consists of the steps of admixing from 1/2 to 6/1 parts of a cracked, highly aromatic petroleum fraction containing at least about 50 weight percent aromatics and having a minimum boiling point of about 650° F. with a partially hydrogenated, at

the extent of 100 to 800 s. c. f. of hydrogen/bbl., cracked, highly aromatic petroleum fraction said aromatic fraction containing at least about 50 weight percent aromatics and having a minimum boiling point of about 700° F.; thermally and non-catalytically cracking the mixture in the liquid phase at 0.25–10 v./v./hr., a pressure in the range of 100 to 2500 p. s. i. g., at a temperature in the range of 800° to 1000° F. and stripping the resultant product at a maximum temperature of 525° F. and subatmospheric pressure of less than 20 mm. Hg to produce the desired binder.



---

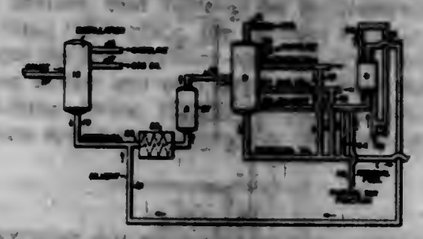
2,772,220

## FEED STOCK FOR NAPHTHA REFORMING

James D. Bushnell, Elizabeth, and Robert L. Berg, Westfield, N. J., assignors to Esso Research and Engineering Company, a corporation of Delaware

Application September 25, 1952, Serial No. 311,342
5 Claims. (Cl. 196—50)

1. The process of preparing a superheated naphtha vapor feed consisting essentially of saturated hydrocarbons not susceptible to gum formation below temperatures of about 400° F. and substantially free of olefinic constituents for a hydrocarbon conversion process which comprises accumulating in storage a body of said naphtha, adding to said naphtha entering storage an amount of gasoline oxidation inhibitor equivalent to from about 0.1 to 1.0 pound per 5,000 gallons of liquid naphtha, withdrawing a naphtha stream from said storage, preheating said naphtha stream by indirect heat exchange to a temperature above about 350° F. at which at least partial vaporization takes place with minimum fouling of exchanger surfaces, subsequently heating said stream further in a separate heater to produce a superheated completely vaporized naphtha stream, and feeding said naphtha vapor to said hydrocarbon conversion process.



---

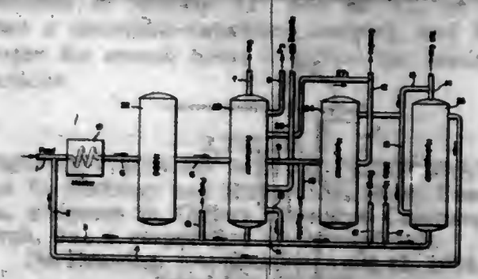
2,772,221

## REACTING HEAVY RESIDUAL FUEL WITH HYDROGEN DONOR DILUENTS

Joseph Stewart, Cranford; Ralph M. Hill, Mountainside, and Arthur W. Langer, Jr., Nixon, N. J., assignors to Esso Research and Engineering Company, a corporation of Delaware

Application July 1, 1953, Serial No. 365,424
5 Claims. (Cl. 196—50)

1. A process for reducing substantially the volume of a heavy fuel oil residuum having a measured content of naphtha insoluble and/or sediment components without substantially increasing said content, which comprises blending said residuum with 10 to 200% by volume of a hydrogen donor diluent obtained as stated thereinafter, passing said blend through a visbreaker under pressure in the range of 300 to 1000 p. s. i. g. and non-catalytically at a feed rate of 0.5 to 15 v./v./hr. and a temperature range of about 750 to 950° F., fractionating the visbroken blend to separate more volatile products, a predominantly aromatic condensed ring [illegible] boiling in a range within the limits of 500° F. to 1000° F., and a heavy fuel oil product, partially hydrogenating said condensed ring fraction by adding thereto 200 to 2000 s. c. f. of hydrogen per barrel, and recycling the hydrogenated fraction as diluent to blend with said original residuum.



---

2,772,222

## PROCESS FOR CRACKING GAS OILS TO GASOLINE

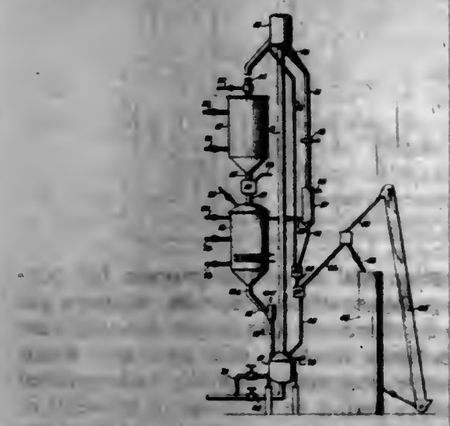
Joseph Stewart, Cranford, and Graham G. Wanless, Westfield, N. J., assignors to Esso Research and Engineering Company, a corporation of Delaware

Application November 18, 1953, Serial No. 392,899
3 Claims. (Cl. 196—50)

1. A hydrogenation and reforming process for converting gas oils to gasolines which comprises: mixing a gas oil feed with 1 to 5 volumes of a hydrogen donor diluent and a recycled bottoms fraction, said hydrogen donor diluent predominantly comprising partially hydrogenated polynuclear aromatics boiling in the range of 650–950 F. derived from a heavy thermal tar; thermally cracking the resulting mixture in the absence of a catalyst at a temperature in the range of 800–1000° F., a residence time in the range of 2–5 v./v./hr. and a pressure in the range of 300–2000 p. s. i. g.; separating the cracked mixture into at least a light fraction boiling below gasoline, gasoline boiling up to about 650° F., a spent diluent fraction boiling in the range of 650–950° F., and a heavy bottoms fraction; hydroforming said gasoline in thepresence of a catalyst at a temperature in the range of 750–1150° F., a residence time in the range of 0.5–6.0 w./hr./w. and a pressure in the range of 50–1000 p. s. i. g., producing thereby a relatively higher octane gasoline product and by-product hydrogen; partially hydrogenating at least a major portion of said spent diluent fraction in the presence of a hydrogenation catalyst with 500–2500 s. c. f. of hydrogen per barrel of spent diluent fraction, a major portion of said hydrogen being composed of said by-product hydrogen; and recycling and blending the partially hydrogenated portion with said feed.

---

2,772,223

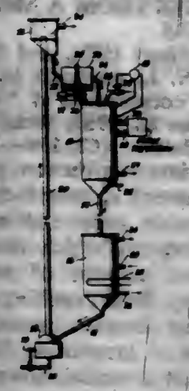


## METHOD AND APPARATUS FOR CONTINUOUSLY REMOVING FINES FROM A MOVING BED CONVERSION SYSTEM

Eric V. Bergstrom, Short Hills, and Edward R. J. Serf, New Brunswick, N. J., assignors to Socony Mobil Oil Company, Inc., a corporation of New York

Application June 22, 1951, Serial No. 233,056
17 Claims. (Cl. 196—52)

3. In a hydrocarbon conversion process wherein a granular contact material is passed cyclically through a hydrocarbon conversion zone and a contact material regeneration zone through which zones it moves as a substantially compact column of solid particles, the method for removing fines resulting from attrition of the cyclically flowing contact material which method comprises: the steps of gravitating the cyclically moving stream of contact material downwardly as a substantially compact column from beneath one of the contacting zones to a feeding zone located therebelow, contacting the contact material with a lift gas in said feeding zone to suspend and transport the material upwardly



through an elongated, laterally-confined passage, discharging the contact material from the top of the passage onto the surface of a substantially compact gravitating bed of the material in a settling zone located above the other contacting zone, withdrawing the main stream of contact material from beneath the settling zone downwardly through a passage in the form of a substantially compact column, discharging the main stream of contact material into the top of the other contacting zone, the cross-section of the passage being substantially smaller than half the cross-section of the settling zone, withdrawing side streams of contact material from beneath the settling zone at a multiplicity of locations substantially equally distributed about the remaining cross-section

of the zone, so as to keep the contact material moving downwardly at a rate which is fast enough to permit the fine particles to trickle downwardly through the contact material, the downward velocity of the contact material above the passage through which the main stream is withdrawn being about 200–400 times faster than the downward velocity of the contact material in the remainder of the settling zone, combining the side streams of contact material into a single side stream of gravitating material which has a substantially greater percentage of fine material than the main stream of contact material, removing the fines from the side stream, and returning the side stream to the main contact material stream substantially free of fine material.

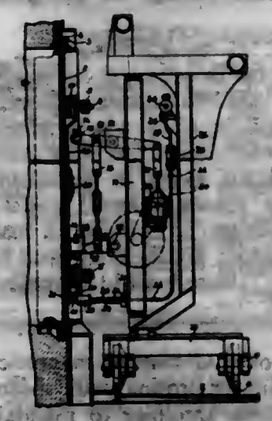
---

**2,772,224**
**METHOD FOR THE TRANSFER OF GRANULAR SOLIDS BETWEEN ZONES OR VESSELS**
Howard W. Shea, West Deptford Township, Gloucester County, N. J., assignor to Socony Mobil Oil Company, Inc., a corporation of New York
Application April 1, 1953, Serial No. 346,196
4 Claims. (Cl. 196—52)

1. In a cyclic catalytic conversion process wherein a granular catalyst is continuously cycled between a high pressure conversion zone wherein the granular catalyst is contacted with a fluid hydrocarbon charge to effect the conversion thereof and a confined regeneration zone at a substantially lower pressure than the conversion zone wherein the carbonaceous contaminants deposited on the catalyst in the conversion zone are removed by burning, the improved method of passing the catalyst from the regeneration zone into the conversion zone so as to maintain the required pressure in each, which comprises: passing catalyst from the regeneration zone into one end of a confined helical passageway with principal axis maintained in a substantially horizontal plane, rotating said passage about its principal axis so as to effect movement of the catalyst through the passage in a helical path away from the point of introduction and in a direction opposite to the direction of the apparent motion, maintaining an enclosed seal zone above the conversion zone and maintaining a substantially compact bed of catalyst within the seal zone, supplying seal gas to the seal zone to maintain the pressure therein slightly in excess of the pressure in the conversion zone, discharging the catalyst from the helical passage and passing the catalyst downwardly onto the surface of the bed in the seal zone through a confined gas-tight passage, maintaining the last bend of the helical passage before discharge of the catalyst of sufficiently reduced size that the helical passage will be maintained at least 60 percent full of catalyst at all times, maintaining the length of the helical passage between the point of entry and discharge of catalyst sufficient to prevent disruption of the catalyst accumulation within the helical passage due to seal gas flow through the helical passage from the seal zone when the level of catalyst in the helical passage is at the minimum permitted by the last bend of the passage, controlling the rate of rotation of the helical passage so that when the level of granular solids is at the minimum permitted by the last bend, the flow of catalyst through the helical passage will be in excess of the maximum contemplated flow through the conversion zone and passing catalyst from the lower section of the bed in the seal zone into the conversion zone.

---

**2,772,225**
**METHOD AND APPARATUS FOR EFFECTING CONVERSION OF HYDROCARBONS**
Eric V. Bergstrom, Short Hills, and Edward J. Sorf, New Brunswick, N. J., assignors to Socony Mobil Oil Company, Inc., a corporation of New York
Application May 24, 1952, Serial No. 289,822
13 Claims. (Cl. 196—52)



1. A method of withdrawing granular contact material from a high temperature reaction zone in which hydrocarbons are converted to gasiform products which comprises: withdrawing a downwardly moving stream of contact material in substantially compacted columnar form, of restricted cross-section and of sufficient length to inhibit the transfer of gas into or out of the reaction

zone, introducing a first gas, which is not reactive under the conditions in the reaction zone, into the column of contact material at a level below the reaction zone, at a pressure slightly higher than the pressure in the reaction zone, introducing a second gas, which is reactive under the conditions in the reaction zone, into the column of contact material at a level below the level at which the first gas is introduced at a pressure which is slightly lower than the pressure of the first gas, and withdrawing a mixture of the first and second gases from the column of contact material at a level below the level at which the second gas is introduced.

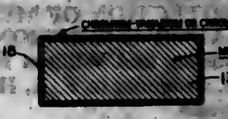
**2,772,226**
**COKE OVEN DOOR**
Franz Doll, Essen, Germany, assignor, by mesne assignments, to Koppers Company, Inc., Pittsburgh, Pa., a corporation of Delaware
Application April 25, 1952, Serial No. 284,281
8 Claims. (Cl. 202—248)



1. Apparatus for sealing and unsealing coke oven doors comprising: a coke oven door having locking means in the form of two upper and lower latching devices for coaction with door-holding means and compression spring means individual thereto to exert the closure pressure, for exertion of closure pressure between the door and the door-holding means, and for release of said closure pressure for unlocking the door; separate fluid pressure-operated means operable on the respective latching devices for effecting spring compression operation of the same; a source of fluid pressure for actuating said fluid pressure-operated means; a coupling between the source of fluid pressure and the fluid pressure-operated means of both said latching devices, and a pressure delay valve to control the fluid flow to and from one of the fluid pressure-operated devices, said valve being so constructed that, when latching takes place, the pressure medium first exhausts from the fluid-pressure-operated device of the lower latching device and only gradually from that of the upper latching device, for the purpose of releasing the compression spring means to allow the same to seal the door.

**2,772,227**
**PROTECTION OF MOLYBDENUM AND TUNGSTEN AT HIGH TEMPERATURES**
Martin F. Quealy, Montclair, and William C. Littlefield, Mountain Lakes, N. J., assignors to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application June 29, 1953, Serial No. 364,632
5 Claims. (Cl. 204—32)

4. The method of protecting against oxidation at high temperature articles constructed of metal of the group consisting of molybdenum, tungsten, and alloys thereof with each other and with small proportions of metal of the group consisting of cobalt, nickel and iron, comprising cleaning said articles, electroplating by making them cathodes in an electrolytic cell in which the electrolyte consists of an aqueous solution of chromic acid containing 150 to 350 grams of chromium trioxide per liter and vanadium salt containing 2 to 10 grams of vanadium per liter, said electrolyte also containing acetic acid to

increase the working temperature range and obtain more uniform coatings, with a current density during plating of about one ampere per square centimeter, and a bath temperature of between 35° and 50° C., to produce thereon a chromium-vanadium complex, and firing in hydrogen for several hours to diffuse the coatings into the articles.

---

**2,772,228**
**PREPARATION OF METAL FLUOBORATES**
Albert D. McElroy and Richard M. Hunt, Evans City, Pa., assignors to Callery Chemical Company, Pittsburgh, Pa., a corporation of Pennsylvania
No Drawing. Application April 12, 1954, Serial No. 422,648
11 Claims. (Cl. 204—59)

1. A method of preparing metal fluoborates comprising electrolyzing a non-aqueous solution of an ionic metal fluoborate with an anode of the desired metal in a solvent in which the desired metal fluoborate is substantially insoluble and recovering the fluoborate precipitated at the anode.

---

**2,772,229**
**PREPARATION OF PERCHLORATES**
Errol Hay Kerr, Tacoma, Wash., assignor to The Pennsylvania Salt Manufacturing Company, Philadelphia, Pa., a corporation of Pennsylvania
No Drawing. Application July 13, 1953, Serial No. 367,765
5 Claims. (Cl. 204—82)

1. In a process for the production of a perchlorate by the electrolysis of an aqueous acid solution of the corresponding chlorate in a non-diaphragm electrolytic cell in which without acid addition the electrolyte becomes alkaline during the course of electrolysis, the improvement comprising the addition of perchloric acid to maintain the electrolyte at a pH below 7.

---

**2,772,230**
**PREPARATION OF ZINC ELECTROLYTES**
Max L. Hollander, Plainfield, and Yurii E. Lebedeff, Metuchen, N. J., assignors to American Smelting and Refining Company, New York, N. Y., a corporation of New Jersey
No Drawing. Application September 29, 1953, Serial No. 383,131
3 Claims. (Cl. 204—119)

1. In a method of electrowinning zinc involving electrolyzing a zinc sulfate electrolyte with an insoluble anode, and cyclically refortifying the spent electrolyte from the electrolysis and removing dissolved iron from the refortified electrolyte under non-reducing conditions by a procedure involving leaching an oxidic zinciferous material with said spent electrolyte to refortify the latter, partially neutralizing the refortified solution while oxidizing ferrous iron therein to the ferric state to precipitate the iron contained in the solution without substantial precipitation of dissolved zinc, and filtering the refortified solution to separate therefrom the thus precipitated iron, said partially neutralized solution being characterized by variations in its filtering rate, the improvement comprising introducing a soluble pentavalent arsenate compound at a point in said procedure after said electrolysis step and

prior to said filtration step thereby reducing variations in the filtering rate of the partially neutralized solution and the net filtering time thereof.

2,772,231

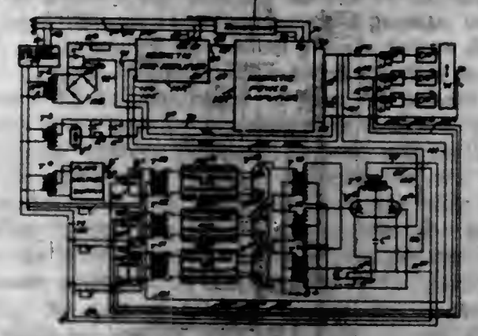
## ANODES FOR THE PROTECTION OF METAL STRUCTURES AGAINST CORROSION

William Godfrey Waite, London, and William Frederick Higgins, Salford, England, assignors to F. A. Hughes & Co. Limited, London, England

Application November 26, 1952, Serial No. 322,648
2 Claims. (Cl. 204—197)

1. A protective system for a ferrous structure immersed in seawater, said system comprising a main anode having a surface area of 0.071 to 0.033 square feet per lb. of metal, a plurality of anode plates located adjacent the main anode and of which the surface area is between 0.261 and 1.72 square feet per lb. of metal so that they become completely consumed by the electrolytic action during an initial period of use, said plates having a smaller volume than said main anode and being between one eighth of an inch and one inch thick, and each having a total surface area of from 200 to 2500 square inches, said plates having surface areas not less than 0.8 of their original surface areas after half their volume has been consumed by dissolution from the periphery inwardly, and a metal rod-like element carrying both the main anode and the plates, said element being rigidly mounted in said main anode, said main anode and plates being made of metal selected from the group consisting of magnesium and magnesium base alloys, said plates being disposed centrally around the axis of said element at both sides of said main anode substantially parallel to each other so as to shield each other against corrosion at their juncture with said element.

---



2,772,232

## ELECTROLYTIC GRINDING APPARATUS

George E. Comstock 3d, Holden, and Karl H. Kalbfleisch, Wellesley Hills, Mass., assignors to Norton Company, Worcester, Mass., a corporation of Massachusetts

Application December 30, 1952, Serial No. 328,726
13 Claims. (Cl. 204—219)

1. In electrolytic grinding apparatus, in combination, a work-support and rotatable grinding wheel means having a plurality of conductive parts insulated from each other each part having a conductive face and with means mounting said work-support and said wheel means in coacting relation for operatively relating a workpiece supported by the work-support to the conductive faces of said conductive parts, means for supplying liquid electrolyte to the interfaces between the work-piece and said conductive faces for electrolytic decomposition at the work-piece face, a saturable-core magnetic amplifier having power winding means energizable by alternating current and having rectifier means in circuit therewith to provide unidirectional current at the output terminals thereof and having electro-magnetic means for changing the magnetic core saturation, a saturable-core control magnetic amplifier having power winding means energizable by alternating current and having rectifier means in circuit therewith to provide unidirectional current for energizing said electro-magnetic means of said first magnetic amplifier to control the latter and having control winding means for affecting its own core saturation, a plurality of supply circuits, one for each of said interfaces, extending from said output terminals by means connecting the positive side of said output terminals to the workpiece and by a plurality of means connecting the negative side thereof respectively to said conductive wheel faces and thereby forming a plurality of parallel electrolytic decomposition circuits, means comprising a rectifier bridge energized by alternating current and providing at its output a selectable unidirectional reference voltage, means dependent upon the voltage supplied to said supply circuits by said first-mentioned magnetic amplifier and upon said reference voltage for energizing said control

winding means of said control magnetic amplifier and thereby affect said electro-magnetic means of said first-mentioned magnetic amplifier to maintain substantially constant the voltage at which the latter supplies current to said supply circuits whereby the respective current across said plurality of interfaces may vary relative to one another, a plurality of current-responsive means, one for each of said supply circuits and each responding to current flow in its associated interface of a selected maximum value such as a current value less than that which causes detrimental arcing thereacross, and means interrelating said plurality of current-responsive means and said controlling winding means for affecting the energization of the latter and thereby control the output of said first amplifier responsively to any of said current-responsive means to effect limitation of the current flow across its corresponding interface to said maximum value and thereby impose substantially the same potential upon all of said conductive faces whereby to avoid or lessen material potential differences between conductive faces and avoid or lessen electrolytic action between them.

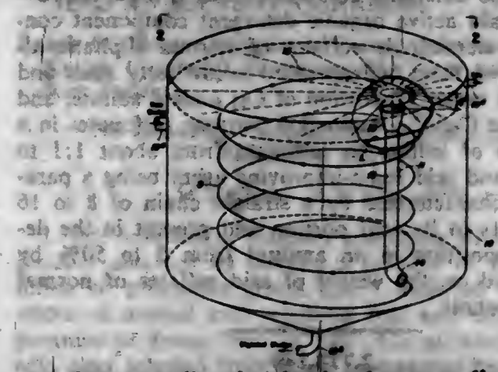
## ANAEROBIC DIGESTION TANKS WITH DIGESTING MECHANISM



Frederick G. Nelson, La Habra, Calif., assignor to Dorr-Oliver Incorporated, a corporation of Delaware

Application July 26, 1954, Serial No. 445,650
3 Claims. (Cl. 210—2)

1. The method of treating a body of anaerobically digestible sewage sludge in a round digester tank while maintaining a substantially constant sludge level therein as fresh sludge is being introduced into, and digested sludge being withdrawn from the tank, and while scum from the top strata of said body is being depressed into said body by way of a plurality of vertically induced downdraft streams spaced substantially uniformly from one another about the center of the tank, which method comprises orienting the vertical downward direction of each of said streams by way of gradual transition into

substantially horizontal direction, so that the respective horizontal directions of said streams are codirectionally disposed and oriented with respect to the tank wall as well as with respect to one another, each at an obtuse angle relative to the tank radius as defined by two points namely the vertical axis of the respective vertical downdraft stream and vertical axis of the tank, whereby an outward velocity component of each respective hori-

zontal stream direction is aimed at an adjacent bottom corner portion of the tank, while an upward velocity component induces in the body of digesting sludge a spiralized upward path of sludge movement, whereby there are maintainable in effect sequential horizontal strata of intermixing sewage matter and thus a substantially uniform distribution of gasifiable sludge solids throughout said body of digesting sludge along with depression and elimination of the scum.

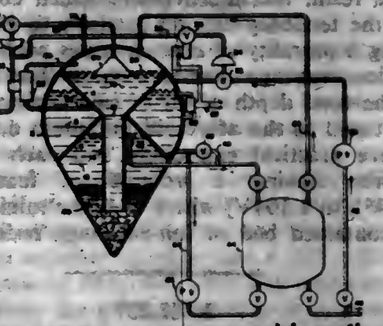
## SLUDGE TREATMENT

Earl M. Kelly, Hillsborough, Burlingame, Calif., assignor to Process Engineers Incorporated, San Francisco, Calif., a corporation of California

Application May 14, 1953, Serial No. 354,983
2 Claims. (Cl. 210—2)



1. In the treatment of sewage containing solids suspended in liquid involving introducing the sewage into a pool in which the solids would settle to the bottom to produce a sludge of maximum density under quiescent conditions, and the withdrawal of sludge from the bottom of the pool, the improvement which comprises introducing the sewage into the pool and withdrawing the sludge from the bottom of the pool at such fast rates that the withdrawn sludge contains less than 5% solids by weight and is substantially less than maximum in density, dissolving gas in the withdrawn sludge under pressure and thus charge it, introducing the charged pressurized sludge into a second pool maintained at a reduced pressure so that at least some of the gas comes out of solution in the second pool as bubbles and raises solids in the second pool to form a scum on its surface, and skimming the scum from the surface.

2,772,235

## LIQUID TREATMENT APPARATUS

Ervin J. Bosbyshell and Gibson T. Hutchison, Abington, Pa., assignors to Cochrane Corporation, Philadelphia, Pa., a corporation of Pennsylvania

Application October 14, 1954, Serial No. 462,232
3 Claims. (Cl. 210—16)

1. Liquid treatment apparatus comprising a liquid treatment tank including a first liquid treatment compartment and a liquid storage compartment, means providing a second liquid treatment compartment, means for conducting liquid to be treated to said first treatment compartment, means for conducting treated liquid from said first treatment compartment to one side of said second treatment compartment, means for conducting additionally treated liquid from the other side of said second treatment compartment, means for conducting liquid from said other side of said second treatment compartment to said storage compartment, a flow control means in said last mentioned conducting means, means responsive to the liquid level in said first treatment compartment for positioning said flow control means, means for conducting liquid from said storage compartment to said other side of said second treatment compartment, and means for conducting liquid from said one side of said second treatment compartment to said first treatment compartment.

## METHOD FOR REDUCING FRACTURING OF ION-EXCHANGE RESINS

Harry L. Coonradt, Woodbury, and Wilbur K. Lewman, Pitman, N. J., assignors to Socony Mobil Oil Company, Inc., a corporation of New York

Application April 25, 1952, Serial No. 284,414
3 Claims. (Cl. 210—24)

1. In the method of treating liquids to remove materials dissolved therein by contact with particles of ion-exchange resin of a type having a tendency, during each cycle where there is a marked change of pH or alternate contact with organic and aqueous media, for said particles of ion-exchange resin to expand and contract and to fracture due to compressive forces and for said fractured particles to float out of the contact zone, and which method comprises establishing a contact zone containing a bed of said particles of ion-exchange resin of minimum depth of at least two feet and sufficient to achieve practical extraction of undesired materials dissolved in a liquid to be treated, passing in a cyclic manner a liquid containing undesired material removable by contact with ion-exchange resin through said bed to obtain a treated

liquid effluent of desired reduced concentration of said undesired dissolved material and a resin bed containing extracted undesired material, removing entrained liquid from said bed of ion-exchange resin, contacting said bed of ion-exchange resin with a resin regenerating liquid, and passing liquid to be treated through said bed of ion-exchange resin, the improvement which comprises minimizing the tendency of said particles to fracture by establishing a plurality of contact zones each containing a bed of ion-exchange resin not more than 12 inches in depth, the total depth of all of said beds of resin being at least equal to the aforesaid minimum depth sufficient to achieve practical extraction, and each of said contact zones having a volume at least equal to [V+(0.055 to 1.10)V] where V is the minimum volume of the contained bed of ion-exchange resin.

## PROCESS FOR REMOVING ACIDS FROM AQUEOUS SOLUTIONS OF ORGANIC SOLUTES WITH ION EXCHANGE RESINS

William C. Bauman and Donald F. Harrington, Midland, Mich., assignors to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Application May 12, 1953, Serial No. 354,632

6 Claims. (Cl. 210—24)

1. A process for removing a strong acid from an aqueous solution of an organic solute, which process comprises passing an aqueous solution containing a strong acid having an ionization constant of at least $1.4\times10^{-3}$ at 25° C., and an organic compound having an acidity corresponding to an ionization constant not exceeding $1.75\times10^{-5}$ at 25° C., as solute, into contact with a water-immersed bed of an anion exchange resin in the sulfate form and thus displacing from the bed an equal volume of water, whereby the strong acid solute is absorbed by the resin and thus converts at least a portion of the anion exchange resin to the bisulfate form, then feeding water to the bed to displace a further amount of liquid from the bed, and collecting successive fractions of the effluent liquid, whereby there is obtained a fraction of the displaced effluent liquid which contains a major portion of the organic compound as solute, and thereafter washing the anion exchange resin with water, whereby the anion exchange resin is regenerated to the sulfate form.

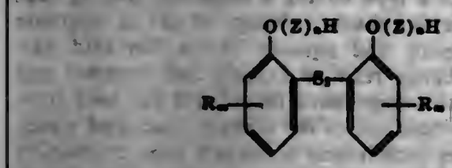
2,772,238



## FOAM-INHIBITED LUBRICATING OILS

Warren Lowe, Berkeley, Calif., assignor to California Research Corporation, San Francisco, Calif., a corporation of Delaware

No Drawing. Application June 24, 1955, Serial No. 517,925

7 Claims. (Cl. 252—48.2)

1. A foam inhibited lubricating oil composition comprising a major proportion of an oil of lubricating viscosity and an alkylphenyl polyethyleneglycol ether sulfide of the formula

wherein R represents an aliphatic group containing less than 31 carbon atoms, Z is an ethylene oxide group, *m* is a number having a value from 1 to 3, and *n* is a number having a value from about 8 to about 17, in an amount sufficient to inhibit foaming of said oil composition.

2,772,239

## DETERGENT COMPOSITIONS

Allen R. Lewis and Richard D. Stayner, Berkeley, Calif., assignors to California Research Corporation, San Francisco, Calif., a corporation of Delaware

No Drawing. Application February 2, 1954, Serial No. 407,818

4 Claims. (Cl. 252—161)

1. A detergent composition consisting essentially of an active organic detergent component and a foam-improving agent, said active organic detergent component consisting of water-soluble sulfates of normal aliphatic alcohols derived from hydrogenated tallow fatty acids and containing a major proportion of $C_{18}$ n-alkyl sulfate, and water-soluble $C_{12}$–$C_{18}$ monoalkyl benzene sulfonates in a weight ratio of sulfate to sulfonate from about 1:1 to about 1:6; and said foam-improving agent being a para-acylphenol characterized by a straight chain of 8 to 16 carbon atoms in its acyl portion and present in the detergent composition in an amount from 5 to 50% by weight, based on the weight of said sulfates of normal aliphatic alcohols.

2,772,240

## METHOD OF TREATING RESIDUAL LIQUORS OBTAINED IN THE MANUFACTURE OF PULP BY THE SULPHATE CELLULOSE PROCESS

Karl Gustaf Treboeck, Stockholm, and Hilding Olof Vidar Bergstrom, Stockmund, Sweden

No Drawing. Application June 18, 1950, Serial No. 167,482

1 Claim. (Cl. 252—183)

Method of treating green liquor obtained in sulphate cellulose process which comprises oxidizing said liquor until a sulphide content of 0% is obtained, mixing this oxidized green liquor with untreated green liquor before causticizing so that the resultant white liquor has a sulphidity of approximately 20 to 25%.

---

2,772,241

## HALOPHOSPHATE PHOSPHORS

Peter Whitton Ranby, London, England, assignor to Thorn Electrical Industries Limited, London, England, a company of Great Britain

No Drawing. Application March 10, 1951, Serial No. 215,011

Claims priority, application Great Britain March 14, 1950

2 Claims. (Cl. 252—301.4)

2. An artificial luminescent material consisting essentially of a halophosphate of at least one of the metals in the group consisting of calcium, strontium, barium, zinc and cadmium, the halogen in the halophosphate being selected from the group consisting of fluorine, and fluorine plus chlorine, the amount of fluorine being greater than the amount of chlorine, and an activator, selected from the group consisting of silver, and silver and manganese together, the proportions of the ingredients being such that the gram-atom ratio of the metals to phosphorus is between 50/50 and 50/30 inclusive, the gram-atom ratio of metals-plus-phosphorus to halogen being between 1/0.05 and 1/0.5, inclusive, the silver content being between 0.01% and 5%, inclusive, by weight, and the manganese content being between zero and 10%, inclusive, by weight.

---

2,772,242

## ELECTROLUMINESCENT ZINC SULFIDE PHOSPHOR

Keith H. Butler, Marblehead, Mass., assignor to Sylvania Electric Products Inc., a corporation of Massachusetts

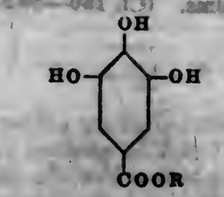
No Drawing. Application June 8, 1951, Serial No. 230,711

3 Claims. (Cl. 252—301.6)

1. An electroluminescent phosphor comprising zinc sulfide containing between about 0.0003 to 0.0015 gram-atom of copper actuator, about 0.0001 to 0.03 gram-atom of manganese activator and between about 0.0000005 and about .00005 gram atom of lead, per mole of zinc sulphide.

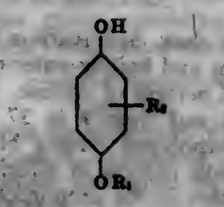
---

2,772,243



## ANTIOXIDANT CONCENTRATES COMPRISING REACTION PRODUCTS OF MIXED GLYCERIDES AS SOLVENT CARRIERS

Ralph W. Bentz, Kingsport, Tenn., assignor to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey



No Drawing. Application August 6, 1953, Serial No. 372,809

16 Claims. (Cl. 252—399)

1. An antioxidant solution consisting of the reaction product obtained by heating a mixture of from 1 to 3 moles of propylene glycol and 1 mole of mixed glycerides of animal and vegetable fats and oils at a temperature of from 100° to 180° C., at least one gallic acid ester selected from those represented by the following general formula:

wherein R represents an alkyl group containing from 1 to 12 carbon atoms, and at least one alkylated hydroxyphenyl ether selected from those represented by the following general formula:

wherein $R_1$ represents an alkyl group containing from 1 to 2 carbon atoms and $R_2$ represents a tertiary alkyl group containing from 4 to 5 carbon atoms, the total weight of the gallic acid ester being from 2 to 30% of the weight of the concentrate and the total weight of the alkylated hydroxyphenyl ether being from 3 to 50% by weight of the concentrate.

---

2,772,244

## TITANIUM-PHOSPHORUS CATALYST

Harold Shalit, Drexel Hill, Pa., and Arthur P. Lien, Highland, Ind., assignors to Standard Oil Company, Chicago, Ill., a corporation of Indiana

No Drawing. Application December 1, 1952, Serial No. 323,517

9 Claims. (Cl. 252—437)

1. A process for the manufacture of a solid, self-supporting catalyst which consists essentially of mixing a titanium halide selected from the group consisting of the chlorides and bromides of titanium with a phosphoric acid selected from the group consisting of orthophosphoric and pyrophosphoric acids in an atomic ratio of halogen to active hydrogen between about 0.4:1 and 1:1 and heating the resulting mixture at a temperature above about 175° C. until evolution of hydrogen halide therefrom substantially ceases.

---

2,772,245

## RESILIENT CELLULAR RESIN PRODUCTS

Eli Simon, Los Angeles, Frank W. Thomas, Burbank, and Welton E. Burney, Jr., West Los Angeles, Calif., assignors to Lockheed Aircraft Corporation, Burbank, Calif.

No Drawing. Application April 26, 1952, Serial No. 284,656

12 Claims. (Cl. 260—2.5)

1. The cellular material which is the product of reaction of a foaming composition comprising on a percentage by weight basis from 10 to 60% castor oil; from 10 to 60% of a glyceryl ester of fatty acids selected from the group consisting of glyceryl mono fatty acid esters and glyceryl di fatty acid esters; from 0.25 to 15% of an alkali metal salt of monocarboxylic fatty acids serving as a catalyst and soluble in said ester and which when in a 5% by weight aqueous solution has a pH greater than 8, the fatty acids of both said ester and said catalyst being selected from the group consisting of ricinoleic acid, oleic acid, lauric acid, stearic acid, linoleic acid and caprylic acid; from 20 to 60% meta-toluene diisocyanate; and from 0.1 to 5% water.

---

2,772,246

## CELLULAR PHENOL ALDEHYDE PLASTIC RESINS

Eli Simon, Los Angeles, and Frank W. Thomas, Burbank, Calif., assignors to Lockheed Aircraft Corporation, Burbank, Calif.

No Drawing. Application August 6, 1952, Serial No. 302,996

14 Claims. (Cl. 260—2.5)

1. The cellular plastic material which is the product of reaction of a foaming flowable composition comprising on a percentage by weight basis from about 60 to about 90% of an acid catalyzable water miscible phenol-aldehyde resol, from about 0.2 to about 10% of a water insoluble gassing agent that liberates gas when reacted with an acid selected from the group of metallic powders consisting of aluminum powder, zinc powder, iron powder and magnesium powder, and a catalyst comprising from 10 to 18% of an organo phosphoric acid selected from the group consisting of—glycero phosphoric acid, di-methyl-acid-pyrophosphate, mono-octyl-acid-pyrophosphate, di-methyl-tri-polyphosphoric acid, mono-octyl-hemi-phosphoric acid, mono-ethyl-di-meta-phosphoric acid; a mineral acid in the proportion of from 10 to 90% and from 90 to 10% of the organo phosphoric acid, from 5 to 60% water, and from 5 to 50% by weight of the catalyst of a polyhydric alcohol the catalyst being in the proportion range of from 35% of the catalyst to 65% of the resin to 10% of the catalyst to 90% of the resin.

---

2,772,247

## ANTI-BLOCKING ADHESIVE COMPOSITION CONTAINING POLYETHYLENE, TACKIFYING RESIN, AND A POLYVINYL ESTER

George O. Schroeder, Chicago, Ill., assignor to American Can Company, New York, N. Y., a corporation of New Jersey

No Drawing. Application November 20, 1951, Serial No. 257,437

7 Claims. (Cl. 260—27)

6. A non-blocking adhesive composition comprising from about 2% to 10% by weight of a polyethylene having a molecular weight of from about 4,000 to about 10,000, from about 17% to 43% by weight of a tackifying resin selected from the group consisting of a rosin, a rosin polymer, a polyhydric alkanol ester of rosin, a thermoplastic terpene-phenol resin and mixtures thereof, and about from 47% to 81% by weight of a polyvinyl ester of a lower molecular weight alkanoic acid having a viscosity of from about 13 to 28 seconds as measured by a 20% solution in acetone at 25° C. with a No. 4 Ford cup, said alkanoic acid having from 2 to 4 carbon atoms.

2,772,248

**WATER-SOLUBLE EPOXY-AMINE RESINS**

Emanuel E. Lieberman, Woodside, and Henry Yanko, Kew Gardens, N. Y., assignors to Interchemical Corporation, New York, N. Y., a corporation of Ohio

No Drawing. Application May 4, 1953, Serial No. 353,661

11 Claims. (Cl. 260—29.2)

1. An aqueous solution of a water-soluble salt of an amine resin, said amine resin being the reaction product of an aliphatic polyamine with a resinous epoxide having an epoxide equivalent of 225 to 1000 and at least one 1,2-epoxide group per molecule and having alternating aliphatic chains and aromatic nuclei united through ether oxygen, said amine containing at least two nitrogen atoms having reactive hydrogen and containing no aliphatic chain longer than 4 carbon atoms, said amine resin being further characterized by containing at least 1.5% nitrogen and by being soluble in dilute aqueous solutions of acid having ionization constants less than $2\times10^{-4}$.

2,772,249

**AIR CURING COATING COMPOSITION AND METHOD OF PREPARING SAME**

Edward Cousins, Akron, and Frank A. Jolliffe, Cuyahoga Falls, Ohio, assignors, by mesne assignments, to The Goodyear Tire & Rubber Company, a corporation of Ohio

No Drawing. Application September 6, 1951, Serial No. 245,428

4 Claims. (Cl. 260—31.2)

1. A method of making a tenaciously adherable erosion-resistant fluid coating composition which is capable of being air-cured by exposure to the atmosphere at ordinary temperatures for a period of from 2 to 72 hours comprising the steps of preparing a composition comprising a polychloroprene, a fumed silica, a metallic oxide in an amount less than 10% by weight of the polychloroprene, the composition being dispersed in equal portions of toluene and amyl acetate, preparing another composition comprising a curing agent selected from the group consisting of catechol, thiocarbanilide, butyraldehyde-aniline, and the condensation product of butyraldehyde and monobutylamine, said curing agent being dissolved in benzene, and combining the curing agent component with the polychloroprene component immediately prior to use to produce said tenaciously adherable erosion-resistant composition said curing agent component being present in the amount of about 2% by weight based on the weight of said polychloroprene.

2,772,250

**ACRYLONITRILE POLYMERS STABILIZED WITH SALTS OF VINYL SULFONIC ACID**

Robert J. Slocombe, Dayton, Ohio, assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application June 14, 1954, Serial No. 436,712

8 Claims. (Cl. 260—45.7)

1. A stable acrylonitrile polymer comprising a polymer of 20% to 100% of acrylonitrile and up to 80% of another monoolefinic monomer copolymerized therewith, said polymer containing intimately dispersed therein from 0.01% to 10% of a salt of vinyl sulfonic acid selected from the group consisting of calcium vinyl sulfonate, magnesium vinyl sulfonate, strontium vinyl sulfonate, aluminum vinyl sulfonate and sodium vinyl sulfonate.

2,772,251

**VULCANIZATION OF ACRYLIC ACID COPOLYMERS**

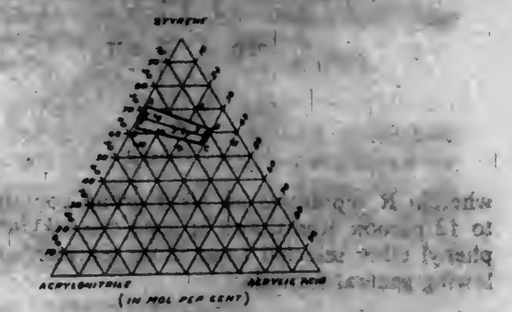
John E. Hanson, North Wales, and Thomas J. Dietz, Philadelphia, Pa., assignors to the United States of America as represented by the Secretary of Agriculture

No Drawing. Application March 14, 1951, Serial No. 215,623

7 Claims. (Cl. 260—79.5)

(Granted under Title 35, U. S. Code (1952), sec. 266)

1. A process of preparing a synthetic rubber comprising compounding a polyalkylene polyamine with a copolymerized mixture of acrylic acid and at least one alkyl acrylate containing not more than 8 carbon atoms in the alkyl group, said acrylic acid and acrylate being present in the copolymerized mixture in the proportions by weight of from 5 to 15 percent of the acrylic acid and from 95 to 85 percent of the acrylate, and then heating the resulting compounded mixture to effect vulcanization.



2,772,252

**TERPOLYMER SYSTEMS**

Joseph Brinkis and Earl C. Chapin, Springfield, Mass., assignors to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

Application September 11, 1952, Serial No. 309,078

5 Claims. (Cl. 260—80.5)

1. A substantially clear, hydrocarbon-resistant, carbon tetrachloride-resistant and boiling-water-resistant terpolymer of 55 to 72 mol percent of styrene, 1 to 30 mol percent of acrylic acid and from 9 to 37 mol percent of acrylonitrile, said terpolymer having been prepared by a mass polymerization process in which the monomers are first mixed together in the proportions desired in the terpolymer and the mixture is then polymerized at 90 to 180° C. in the presence of peroxy catalysts and in the substantial absence of oxygen.

2,772,253

**TERPOLYMERS**

Earl C. Chapin, Springfield, Mass., assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application August 3, 1953, Serial No. 372,189

3 Claims. (Cl. 260—80.5)

1. A multipolymer comprising the copolymerization product of from 2–50 parts of acenaphthylene, from 2–96 parts of a compound taken from the group consisting of acrylonitrile and methacrylonitrile and mixtures thereof and from 2–96 parts of a compound taken from the group consisting of styrene, o-methylstyrene, m-methylstyrene, p-methylstyrene and mixtures thereof, the sum of the parts of each component equalling 100 parts.

2,772,254

**THERMO-SETTING RESIN**

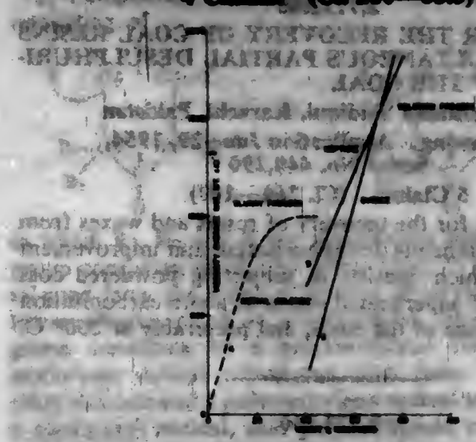
Anthony H. Gleason, Westfield, and Joseph F. Nelson, Rahway, N. J., assignors to Esso Research and Engineering Company, a corporation of Delaware

No Drawing. Application January 30, 1953, Serial No. 334,566

4 Claims. (Cl. 260—86.1)

1. A process for preparing a solid resin from a sodium copolymer of 100 to 50% butadiene 1, 3 and 0 to 50%

of styrene which consists in heating the copolymer at a temperature between 110° C. and 175° C. in the presence of 2.0 to 4.0 of diterbutyl peroxide until a solid resin is obtained.



2,772,255

**POLYMERIZATION PROCESS**

John L. Ernst and Harold J. Rose, Baton Rouge, La., assignors to Esso Research and Engineering Company, a corporation of Delaware

Application December 22, 1952, Serial No. 327,274

4 Claims. (Cl. 260—88.3)

1. Process of making synthetic rubber which comprises copolymerizing an isoolefin of 4 to 5 carbon atoms with an aliphatic diolefin of 4 to 6 carbon atoms in the presence of a hydrocarbon liquid which is a solvent for the reacting monomers and for the resulting polymer, using about 60 to 90% by weight of monomers in the polymerization feed, at a temperature below −50° C. and using as catalyst a solution in said same solvent of a substance selected from the group consisting of Friedel-Crafts catalysts and organic complexes thereof.

2,772,256

**PROCESS FOR POLYMERIZING VINYL CHLORIDE**

Michael A. Mangoncill, Springfield, Mass., assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application August 13, 1953, Serial No. 374,123

10 Claims. (Cl. 260—92.8)

1. A process for preparing a porous granular polymer which comprises polymerizing 100 parts of vinyl chloride in suspension in from about 100 to 200 parts of water containing from about 0.01 to 1 part of a water-insoluble, oil soluble polymerization catalyst and a suspending medium consisting of from about 0.1 to 1 part of a heteropolymer of vinyl acetate and a compound taken from the group consisting of maleic acid and maleic anhydride and from about 0.1 to about 0.3 part of an ethylene oxide condensate of a saturated fatty acid mono-ester of a compound taken from the group consisting of ethylene glycol and glycerol, the fatty acid residue of said mono-ester containing from 12 to 24 carbon atoms, said condensate having a molar ratio of ethylene oxide to fatty acid mono-ester of from about 5:1 to about 15:1.

2,772,257

**PROCESS FOR POLYMERIZING VINYL CHLORIDE**

Michael A. Mangoncill, Springfield, Mass., assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application August 13, 1953, Serial No. 374,124

12 Claims. (Cl. 260—92.8)

1. A process for preparing porous granular polymers which comprises polymerizing 100 parts of vinyl chloride in suspension in from 100 to 200 parts of water containing (A) from about 0.1 to 1 part of a water-insoluble, oil soluble polymerization catalyst and (B) a suspending agent consisting of (a) from about 0.1 to 1 part of a heteropolymer of vinyl acetate and a compound taken from the group consisting of maleic acid and maleic anhydride and (b), from about 0.1 to about 0.3 part of a mixture of (1) an ethylene oxide condensate of a saturated fatty acid mono-ester of pentaerythritol, wherein the fatty acid residue contains from 12 to 24 carbon atoms and wherein the condensate contains from about 1.5 to 2.5 mols of ethylene oxide per mol of fatty acid mono-ester of pentaerythritol and (2) a synergistic material for the ethylene oxide condensate taken from the group consisting of saturated fatty acid mono-esters of glycerol, ethylene glycol and diethylene glycol, the fatty acid residue containing from 12 to 24 carbon atoms, said mixture consisting of from 0.5 to 1.5 parts of synergistic material per part of ethylene oxide condensate.

2,772,258

**PROCESS FOR POLYMERIZING VINYL CHLORIDE**

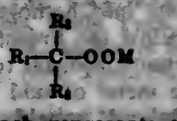
Michael A. Mangoncill, Springfield, Mass., assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application August 13, 1953, Serial No. 374,125

7 Claims. (Cl. 260—92.8)

1. A process for preparing a porous granular polymer which comprises polymerizing 100 parts of vinyl chloride in suspension in from 100 to 200 parts of water containing from about 0.01 to 1 part of a water-insoluble, oil-soluble polymerization catalyst and a suspending medium consisting of from about 0.1 to 1 part of a heteropolymer of vinyl acetate and a compound taken from the group consisting of maleic acid and maleic anhydride and from about 0.1 to about 0.3 part of an ethylene oxide condensate of a saturated fatty acid mono-ester of pentaerythritol having a fatty acid residue containing from 12 to 24 carbon atoms, said condensate having a molar ratio of ethylene oxide to fatty acid mono-ester of from about 0.5:1 to about 1.5:1.

2,772,259



**ALKALI HYDROPEROXIDES AS OLEFIN POLYMERIZATION CATALYSTS**

Hugh J. Hagemeyer, Jr., Kingsport, Tenn., assignor to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey

No Drawing. Application August 13, 1953, Serial No. 374,147

7 Claims. (Cl. 260—94.9)

1. A process which comprises heating ethylene in the presence of a catalyst selected from those represented by the following general formula:

wherein $R_1$ and $R_2$ each represents an alkyl group of from 1 to 2 carbon atoms, $R_3$ represents a mononuclear aromatic group of the benzene series, and M represents an alkali metal atom, at a temperature of from about 145–175° C. and a pressure of about 200 to 1,000 atmospheres.

2,772,260

**FUNGICIDAL COMPOSITION**

Charles C. Yeager, Glen Ellyn, Ill., assignor to Scientific Oil Compounding Company, Inc., a corporation of Illinois

No Drawing. Application October 29, 1953, Serial No. 389,147

23 Claims. (Cl. 260—102)

1. The method of forming a composition of matter comprising heating at an elevated temperature sufficient

to place the reactants into homogeneous solution, said temperature being below the lowest decomposition temperature of the reactants, a metal ammine complex salt of a rosin amine, the metal of said metal ammine complex being from a water-soluble salt of a metal capable of forming a complex with ammonia and a water-insoluble mono-carboxylic acid soap having at least 6 carbon atoms in the carboxylic acid, said carboxylic acid being not otherwise substituted than with a hydrocarbon radical and the hydroxyl radical.

---

2,772,261

## FUNGICIDAL COMPOSITION

Charles C. Yeager, Glen Ellyn, Ill., assignor to Scientific Oil Compounding Company, Inc., a corporation of Illinois

No Drawing. Application August 26, 1954, Serial No. 452,448
24 Claims. (Cl. 260—102)

1. The method of forming a composition of matter comprising heating at an elevated temperature sufficient to place the reactants into homogeneous solution below the lowest decomposition temperature of the reactants, a complex metal ammine salt of a rosin amine, said metal of said salt being a metal whose salt is capable of forming a complex with ammonia a water insoluble carboxylic acid soap and a quinoline selected from the group consisting of quinoline, isoquinoline, a halogen substituted quinoline, a nitroquinoline, an alkoxy quinoline and an alkyl quinoline.

---

2,772,262

## FUNGICIDAL COMPOSITION

Charles C. Yeager, Glen Ellyn, Ill., assignor to Scientific Oil Compounding Company, Inc., a corporation of Illinois

No Drawing. Application October 29, 1953, Serial No. 389,158
15 Claims. (Cl. 260—102)

1. The method of forming a composition of matter comprising heating at an elevated temperature sufficient to place the reactants into homogeneous solution, said temperature being below the lowest decomposition temperature of the reactants, a rosin ammonium phenoxide and a water insoluble carboxylic acid soap.

---

2,772,263

## FUNGICIDAL COMPOSITION

Charles C. Yeager, Glen Ellyn, Ill., assignor to Scientific Oil Compounding Company, Inc., a corporation of Illinois

No Drawing. Application October 29, 1953, Serial No. 389,146
26 Claims. (Cl. 260—102)

1. The method of forming a composition of matter comprising heating at an elevated temperature sufficient to place the reactants into homogeneous solution, said temperature being below the lowest decomposition temperature of the reactants, a metal rosin ammonium phenoxide complex, the metal of said complex being from a water-soluble metal salt capable of forming a complex with ammonia, and a water-insoluble mono-carboxylic acid soap having at least 6 carbon atoms in the carboxylic acid, said carboxylic acid being not otherwise substituted than with a hydrocarbon radical and the hydroxyl radical.

---

2,772,264

## FUNGICIDAL COMPOSITION

Charles C. Yeager, Glen Ellyn, Ill., assignor to Scientific Oil Compounding Company, Inc., a corporation of Illinois

No Drawing. Application October 29, 1953, Serial No. 389,159
26 Claims. (Cl. 260—102)

1. The method of forming a composition of matter comprising heating at an elevated temperature sufficient to place the reactants into homogeneous solution, said temperature being below the lowest decomposition temperature of the reactants, a metal rosin ammonium phenoxide complex the metal of said complex being from a water-soluble metal capable of forming a complex with ammonia, a water-insoluble mono-carboxylic acid soap having at least 6 carbon atoms in the carboxylic acid, said carboxylic acid being not otherwise substituted than with a hydrocarbon radical and the hydroxyl radical and a quinoline.

---

2,772,265

## PROCESS FOR THE RECOVERY OF COAL RESINS WITH SIMULTANEOUS PARTIAL DESULPHURISATION OF THE COAL

Salimuzzaman Siddiqui, Karachi, Pakistan

No Drawing. Application June 29, 1954, Serial No. 440,290
5 Claims. (Cl. 260—107)

1. A process for the recovery of resins and waxes from coal with simultaneous desulphurisation and improvement of the coal, which consists in subjecting powdered coal to the action of superheated steam at a sub-carbonisation temperature range of the coals, and preferably at 200° C. to 330° C.

---

2,772,266

## METHOD OF PREPARING CELLULOSE ACETATE

Carl J. Malm and Loring W. Blanchard, Jr., Rochester, N. Y., assignors to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey

No Drawing. Application August 30, 1952, Serial No. 307,392
3 Claims. (Cl. 260—227)

2. In a method of preparing cellulose acetate in which cellulose is esterified with and dissolves in a mixture of acetic anhydride, acetic acid and catalyst, wherein the reaction temperature rises to but does not exceed a peak temperature within the range of 80–120° F., the steps which comprise initially mixing the cellulose with the acetylation mixture containing 2.5–8% of sulfuric acid based on the cellulose until the cellulose is substantially all acetylated, then adding further sulfuric acid in an amount ½–1½ times that employed in the initial step, thus promoting the esterification and dissolving of unesterified cellulose fibers and inhibiting transesterification in the resulting ester followed by adding to the mass dilute aqueous acetic acid containing a magnesium neutralizing agent in an amount only sufficient to substantially neutralize the amount of sulfuric acid which was added in the second step of the acetylation procedure, whereby the mass is converted to a hydrolyzing system and hydrolyzing the cellulose acetate to acetone solubility.

---

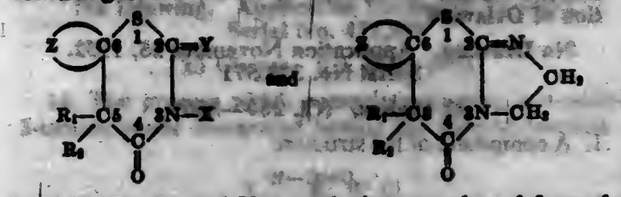
2,772,267

## PRECIPITATION OF HYDROLYZED CELLULOSE ACETATE

Carl J. Malm and Carlton L. Crane, Rochester, N. Y., assignors to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey

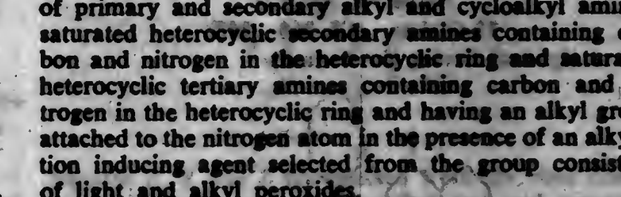
No Drawing. Application October 24, 1952, Serial No. 316,792
1 Claim. (Cl. 260—230)

A method of precipitating hydrolyzed cellulose acetate having an acetyl content of 27–40% from the solution in which it was prepared, which comprises mixing said solution with water containing on the order of 10%, based on the acetic acid in the precipitation liquid, of magnesium sulfate.



2,772,268

## SPIRO CYCLOALKANE-THIAZANEONES



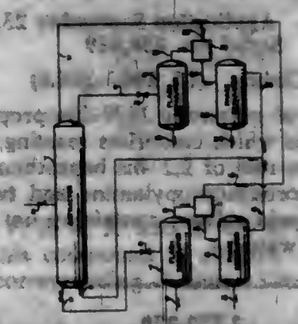
Keith W. Wheeler, Wyoming, Jay K. Sayler, Cincinnati, and Marcus G. Van Campen, Jr., Wyoming, Ohio, assignors to The Wm. S. Merrell Company, a corporation of Delaware

No Drawing. Application March 12, 1954, Serial No. 415,962
4 Claims. (Cl. 260—243)

1. Compounds of the formula selected from the group consisting of

and

in which $R_1$, $R_2$ and X are substituents selected from the group consisting of H, and lower alkyl, Y is a substituent selected from the group consisting of oxygen, imino, and lower alkylimino, Z is a substituent selected from the group consisting of a polymethylene radical, a polymethylene radical substituted with from 1 to 3 lower alkyl radicals and a polymethylene radical substituted with a cyclohexyl radical, said polymethylene radicals having from 4 to 6 carbon atoms.



---

2,772,269

## SEPARATION OF MIXED HETEROCYCLIC NITROGEN COMPOUNDS

William L. Stabler and Glenn H. Dale, Bartlesville, Okla., assignors to Phillips Petroleum Company, a corporation of Delaware

Application August 31, 1953, Serial No. 377,322
10 Claims. (Cl. 260—283)

1. An improvement in separating alkenyl heterocyclic nitrogen compounds from corresponding alkyl heterocyclic nitrogen compounds by liquid-liquid extraction wherein carbonated water is the solvent, said improvement comprising introducing a hydrocarbon having a specific gravity less than that of said mixture into the extraction vessel.

---

2,772,270

## 14-HYDROXYMORPHINONE AND 8,14-DIHYDROXYDIHYDROMORPHINONE

Ulrich Weiss, Jamaica, N. Y., assignor to M. J. Lewenstein, Kew Gardens, N. Y.

No Drawing. Application October 21, 1954, Serial No. 463,207
10 Claims. (Cl. 260—285)

1. As a new compound, 14-hydroxymorphinone.

4. As a new compound, 8,14-dihydroxy-dihydromorphinone.

2,772,271

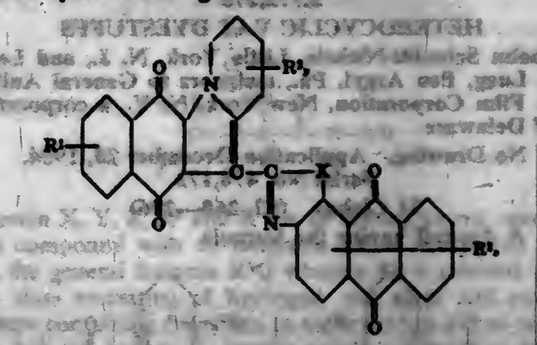
## ADDITION OF OLEFINS AND AMINES

Wilbert H. Urry, Chicago, Ill., assignor to Commercial Solvents Corporation, Terre Haute, Ind., a corporation of Maryland

No Drawing. Application December 1, 1953, Serial No. 395,618
9 Claims. (Cl. 260—299)

1. A process for effecting alpha carbon alkylation of amines which comprises reacting a terminal monoolefine selected from the group consisting of unsubstituted olefins, hydroxy substituted olefins, and cyano substituted olefins and an amine selected from the group consisting of primary and secondary alkyl and cycloalkyl amines, saturated heterocyclic secondary amines containing carbon and nitrogen in the heterocyclic ring and saturated heterocyclic tertiary amines containing carbon and nitrogen in the heterocyclic ring and having an alkyl group attached to the nitrogen atom in the presence of an alkylation inducing agent selected from the group consisting of light and alkyl peroxides.

---



2,772,272

## HETEROCYCLIC VAT DYESTUFFS

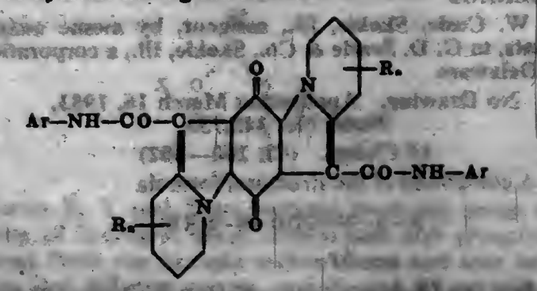
Wilhelm Schmidt-Nickels, Little York, N. J., and David L. Randall, Easton, Pa., assignors to General Aniline & Film Corporation, New York, N. Y., a corporation of Delaware

No Drawing. Application December 28, 1954, Serial No. 478,173
12 Claims. (Cl. 260—294.8)

1. A dyestuff having the formula

wherein $R^1$ is selected from the group consisting of hydrogen nitro, amino and halo; $R^2$ is selected from the group consisting of lower alkyl and halo; $R^3$ is selected from the group consisting of lower alkyl, lower alkoxy, nitro, amino and halo; X is selected from the group consisting of O, S and NH; and y and z have values of 0 to 3.

---



2,772,273

## HETEROCYCLIC VAT DYESTUFFS

Wilhelm Schmidt-Nickels, Little York, N. J., and Lewis J. Lagg, Pen Argyl, Pa., assignors to General Aniline & Film Corporation, New York, N. Y., a corporation of Delaware

No Drawing. Application December 28, 1954, Serial No. 478,170
12 Claims. (Cl. 260—299)

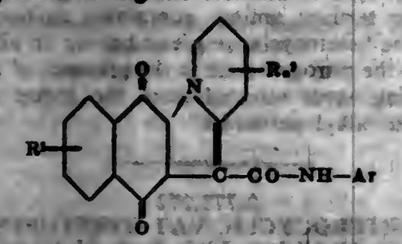
1. A dyestuff having the formula

wherein Ar represents an aromatic radical selected from the group consisting of phenyl and naphthyl radicals and

their auxochrome substituted derivatives; R is selected from the group consisting of lower alkyl and alkoxy; and *n* has a value of 0 to 3.

---

2,772,274



## HETEROCYCLIC VAT DYESTUFFS

Wilhelm Schmidt-Nickels, Little York, N. J., and Lewis J. Lugg, Pen Argyl, Pa., assignors to General Aniline & Film Corporation, New York, N. Y., a corporation of Delaware

No Drawing. Application December 28, 1954, Serial No. 478,171

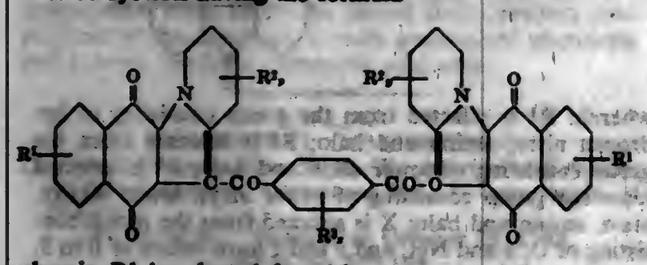
12 Claims. (Cl. 260—295)

1. A dyestuff having the formula

wherein Ar represents an aryl radical; $R^1$ is selected from the group consisting of hydrogen, nitro, amino and halo; $R^2$ is selected from the group consisting of lower alkyl and halo; and *n* has a value of 0 to 3.

---

2,772,275



## HETEROCYCLIC VAT DYESTUFFS

Wilhelm Schmidt-Nickels, Little York, N. J., and Lewis J. Lugg, Pen Argyl, Pa., assignors to General Aniline & Film Corporation, New York, N. Y., a corporation of Delaware

No Drawing. Application December 28, 1954, Serial No. 478,172

11 Claims. (Cl. 260—296)

1. A dyestuff having the formula

wherein $R^1$ is selected from the group consisting of hydrogen nitro, amino and halo; $R^2$ is selected from the group consisting of lower alkyl and halo; $R^3$ is selected from the group consisting of lower alkyl, lower alkoxy and halo; *y* has a value of 0 to 3; and *z* has a value of 0 to 2.

---

2,772,276

## BASIC ESTERS OF N-ARYL-N-(HETEROCYCLYL-ALKYL) CARBAMIC ACIDS AND SYNTHESES THEREOF

John W. Cusic, Skokie, Ill., assignor, by mesne assignments, to G. D. Searle & Co., Skokie, Ill., a corporation of Delaware

No Drawing. Application March 16, 1953, Serial No. 342,733

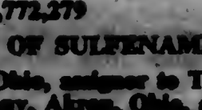
14 Claims. (Cl. 260—302)

1. A compound of the structural formula

wherein A is a lower alkylene radical; B is a lower alkylene radical separating the oxygen and nitrogen atoms attached thereto by at least two carbon atoms; Ar is a monocyclic aryl hydrocarbon radical containing 6 to 10 carbon atoms; X is a member of the class consisting of furyl, thienyl and thiazolyl radicals; and NRR' is a member of the class consisting of monoalkylamino, dialkylamino, pyrrolidino, piperidino and morpholino radicals.

---

2,772,277



## THIAZOLYLMERCAPTOALKANEDIONES

John J. D'Amico, Charleston, W. Va., assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application November 25, 1952, Serial No. 322,571

12 Claims. (Cl. 260—306)

1. A compound of the structure

where T represents a radical selected from the group consisting of 4,5-di(lower alkyl) 2-thiazolyl, 4-(lower alkyl) 2-thiazolyl, arylene hydrocarbon 2-thiazolyl containing less than 14 carbon atoms, chloro substituted 2-benzothiazolyl, 4-(lower alkyl) 5-(lower carboalkoxy) 2-thiazolyl and 4-(lower alkyl) 5-acetyl 2-thiazolyl radicals, R represents a lower alkylene group, R' is selected from the group consisting of alkyl radicals containing less than 11 carbon atoms and alkoxy radicals containing less than 10 carbon atoms and R'' represents an alkyl radical containing less than 10 carbon atoms.

---

2,772,278

## MANUFACTURE OF SULFENAMIDES

Albert F. Hardman, Northampton Township, Summit County, Ohio, assignor to The Goodyear Tire & Rubber Company, Akron, Ohio, a corporation of Ohio

No Drawing. Application September 23, 1954, Serial No. 458,029

12 Claims. (Cl. 260—306.6)

1. The process of preparing N,N-diisopropyl-2-benzothiazolesulfenamide which comprises reacting in an inert organic solvent one mol of 2,2'-*bis* benzothiazyldisulfide, one mol of N-chlorodiisopropylamine and two mols of diisopropylamine, said solvent containing not more than 10% by weight of water.

---

2,772,279

## PREPARATION OF SULFENAMIDES

Richard Lephin, Akron, Ohio, assignor to The Goodyear Tire & Rubber Company, Akron, Ohio, a corporation of Ohio

No Drawing. Application June 17, 1955, Serial No. 516,306

11 Claims. (Cl. 260—306.6)

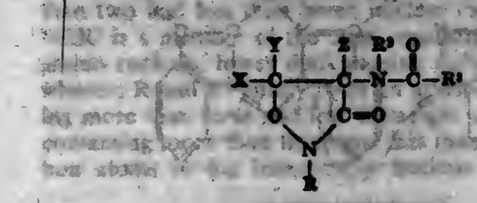
1. The process of manufacturing thiazolesulfenamides which comprises reacting in an inert organic solvent a secondary amine of the general formula

in which $R_1$ and $R_2$ are selected from the group consisting of alkyl, aralkyl, alicyclic, furfuryl, and tetrahydrofurfuryl radicals and radicals in which $R_1$ and $R_2$ are joined to form a cycloaliphatic ring and a compound

selected from the group consisting of 2-mercaptothiazoles and 2,2'-bis-thiazyldisulfides in the presence of a tertiary organic hypochlorite.

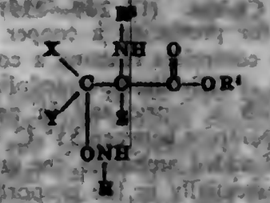
---

2,772,280



## SYNTHESIS OF 4-AMINO-3-ISOXAZOLIDONE AND ITS DERIVATIVES

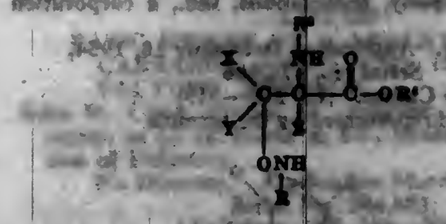
Robert Lawrence Peck, deceased, late of Plainfield, N. J., by Helen McLean Peck, administratrix, Plainfield, N. J., assignor to Merck & Co., Inc., Rahway, N. J., a corporation of New Jersey



No Drawing. Application December 23, 1954, Serial No. 477,398

23 Claims. (Cl. 260—307)

14. The process which comprises reacting a 4-amido-3-isoxazolidone compound having the general formula



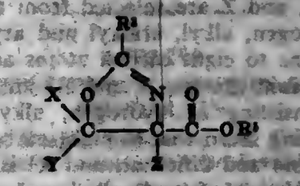
wherein X, Y and Z are selected from the class consisting of hydrogen and alkyl, aralkyl and aryl groups containing from one to eight carbon atoms and may be the same and different groups, R and $R^2$ are selected from the class consisting of hydrogen and alkyl, and aralkyl groups containing from one to eight carbon atoms and may be the same and different groups, and $R^3$ is selected from the class consisting of alkyl, aryl and aralkyl groups containing from one to eight carbon atoms, with an alcohol having the formula $R^4OH$ wherein $R^4$ is a lower alkyl group, to produce the corresponding ester of an α-amino-β-aminoxy-propionate compound having the general formula

wherein X, Y, Z, R, $R^3$ and $R^4$ are as defined above and subjecting this compound to alkaline conditions to produce the corresponding 4-amino-3-isoxazolidone compound.

17. Compounds selected from the group consisting of compounds having the general formula

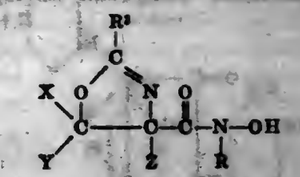
wherein X, Y, and Z are selected from the class consisting of hydrogen and alkyl, aralkyl and aryl groups containing one to eight carbon atoms and may be the same and different groups, R and $R^2$ are selected from the class consisting of hydrogen and alkyl and aralkyl groups containing from one to eight carbon atoms and may be the same and different groups, and $R^3$ is a lower alkyl group; and acid addition salts thereof.

2,772,281



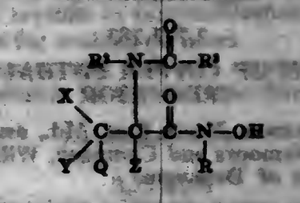
## SYNTHESIS OF 4-AMINO-3-ISOXAZOLIDONE AND ITS DERIVATIVES

Frederick W. Holly, Cranford, and Charles H. Stammer, New Brunswick, N. J., assignors to Merck & Co., Inc., Rahway, N. J., a corporation of New Jersey



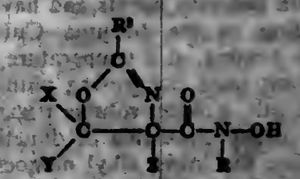
No Drawing. Application December 23, 1954, Serial No. 477,391

56 Claims. (Cl. 260—307)



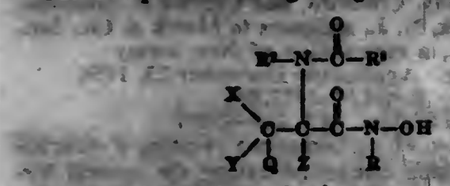
47. The process which comprises reacting a 4-carboalkoxy-2-oxazolidone compound having the general formula—

wherein X, Y and Z are selected from the class consisting of hydrogen and alkyl, aralkyl and aryl containing one to eight carbon atoms and may be the same and different groups, $R^2$ is selected from the class consisting of alkyl, aryl, and aralkyl groups containing from one to eight carbon atoms, and $R^3$ is a one to eight carbon atom alkyl group, with a hydroxylamine having the formula RNHOH wherein R is selected from the class consisting of hydrogen and alkyl, and aralkyl groups containing from one to eight carbon atoms, in the presence of a base to produce the corresponding 4-carbohydroxamido-2-oxazoline compound having the general formula—



wherein X, Y, Z, $R^2$ and R are as defined above, reacting this compound with an ionizable halide compound having the general formula $R^2Q$ wherein $R^2$ is selected from the class consisting of hydrogen and alkyl and aralkyl groups containing from one to eight carbon atoms and Q is a halogen having an atomic weight greater than 30, to produce a β - halopropionohydroxamic acid compound having the general formula—

wherein Q, X, Y, Z, R, $R^2$ and $R^3$ are as defined above, and reacting this latter compound with a water soluble base to produce the corresponding 4-amido-3-isoxazolidone compound.



51. Compounds having the general formula—

wherein X, Y and Z are selected from the group consisting of hydrogen, alkyl, aralkyl and aryl groups containing from one to eight carbon atoms and may be the same and different groups, and R and $R^2$ are selected from the group consisting of hydrogen, alkyl and aralkyl

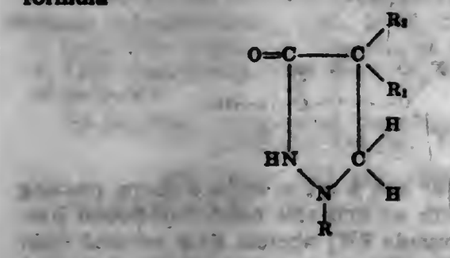
groups containing from one to eight carbon atoms and may be the same and different groups.

52. Compounds having the general formula—

wherein Q is a halogen having an atomic weight greater than 30, X, Y, and Z are selected from the group consisting of hydrogen, alkyl, aralkyl and aryl groups containing from one to eight carbon atoms and may be the same and different groups, R and $R^3$ are selected from the group consisting of hydrogen, alkyl and aralkyl groups containing from one to eight carbon atoms, and may be the same and different, and $R^3$ is selected from the group consisting of aryl, alkyl and aralkyl groups containing from one to eight carbon atoms.

---

## 2,772,282



## 3-PYRAZOLIDONES

Charles F. H. Allen and John R. Byers, Jr., Rochester, N. Y., assignors to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey

No Drawing. Application August 3, 1953, Serial No. 372,148

8 Claims. (Cl. 260—310)

1. A 3-pyrazolidone compound having the general formula

wherein R represents a member of the class consisting of phenyl, tolyl, p-β-hydroxyethylphenyl, and p-β-acetoxyethylphenyl groups, and $R_1$ and $R_2$ each represent an alkyl group containing from 1 to 4 carbon atoms.

---

## 2,772,283

## PRODUCTION OF COPPER PHTHALOCYANINE PRECURSOR

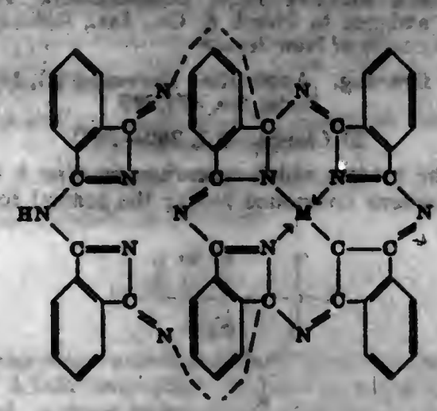
Arthur C. Stevenson, North East, Md., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application October 5, 1953, Serial No. 384,349

5 Claims. (Cl. 260—314.5)

1. A process of producing an alcohol-soluble complex compound adapted to yield copper phthalocyanine upon being treated with reducing agents and having a constitution corresponding to the formula $Cu(C_8H_4N_2)_4NH$, which comprises heating, at a temperature not exceeding 98° C., a reaction mass comprising phthalonitrile, ammonia, a cupric salt, a water-soluble organic solvent selected from the group consisting of dimethylformamide, dimethylacetamide, the lower alkyl monoethers of ethylene glycol and the lower alkyl monoethers of diethylene glycol, and an assistant selected from the group consisting of guanidine, methyl glucamine, imino-phthalimidine and 1,3-diiminoisoindoline, and contacting the reaction mass with oxygen in gaseous form substantially throughout the period of observable reaction.

## 2,772,284



## SOLVENT-SOLUBLE, COMPLEX, PHTHALOCYANINE-YIELDING COMPOUNDS

George Barnhart, Pancoast Hinshaw, and Rockwell F. Stokes, Brandywine Hundred, Del., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application October 29, 1951, Serial No. 252,401

4 Claims. (Cl. 260—314.5)

1. A leuco-phthalocyanine compound of the formula

wherein M represents a metal of the group consisting of nickel and copper, said compound being characterized by being soluble in ethylene-glycol-monoethyl ether, and by yielding upon reduction ammonia, phthalonitrile and the corresponding metal phthalocyanine.

---

## 2,772,285

## PROCESS FOR PRODUCING COPPER-PHTHALOCYANINE PRECURSOR

Robert A. Brochi, Salem, N. J., assignor to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

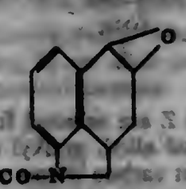
No Drawing. Application January 21, 1953, Serial No. 332,513

8 Claims. (Cl. 260—319)

1. A process for producing a copper phthalocyanine precursor, which comprises reacting a compound of the group consisting of 1,3-diimino-isoindoline and its 4,5-benzo analog with a cupric salt in an inert organic solvent, at a temperature between 55° C. and 95° C. and in the absence of added ammonia, the quantities of said reactants being essentially in the proportion of 6 moles of the diimino-isoindoline compound to 1 mole of cupric salt, and recovering the reaction product by dilution of the solvent.

---

## 2,772,286



## EPOXYBENZ[CD]INDOLES AND THE PREPARATION THEREOF

Eugene J. Fornefeld, Indianapolis, Ind., assignor to Eli Lilly and Company, Indianapolis, Ind., a corporation of Indiana

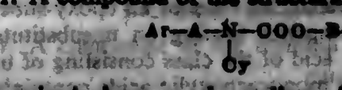
No Drawing. Application December 10, 1954, Serial No. 474,686

16 Claims. (Cl. 260—319)

7. A compound represented by the formula

wherein R represents a member of the group consisting of alkyl radicals having from one to eight carbon atoms, phenyl, phenyl-substituted lower alkyl and lower alkyl-substituted phenyl radicals.

## 2,772,287



## BASIC ESTERS OF N-ARALKYL-N-CYCLOALKYL-CARBAMIC ACIDS AND THE PRODUCTION THEREOF

John W. Cusic, Skokie, Ill., assignor, by mesne assignments, to G. D. Searle & Co., Skokie, Ill., a corporation of Delaware

No Drawing. Application March 16, 1953, Serial No. 342,731

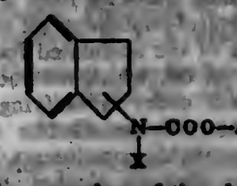
8 Claims. (Cl. 260—326.3)

1. A compound of the structural formula

wherein Ar is a monoisocyclic aryl radical containing less than ten carbon atoms; A is a lower alkylene radical, B is a lower alkylene radical separating the oxygen and nitrogen atoms attached thereto by at least two carbon atoms; Cy is a lower cycloalkyl radical containing more than two and less than seven nuclear carbon atoms; and NRR′ is a member of the class consisting of lower alkylamino radicals, lower dialkylamino radicals and radicals wherein R and R′ jointly form an alkylene chain containing more than three and less than eight carbon atoms and containing more than three and less than six of these carbon atoms in the heterocyclic nucleus formed thereby.

---

## 2,772,288



## BASIC ESTERS OF N-ARYL AND N-CYCLOALKYL INDANCARBAMIC ACIDS, THEIR SALTS AND METHODS FOR THEIR PREPARATION

John W. Cusic, Skokie, Ill., assignor, by mesne assignments, to G. D. Searle & Co., Skokie, Ill., a corporation of Delaware

No Drawing. Application March 16, 1953, Serial No. 342,732

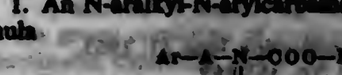
11 Claims. (Cl. 260—326.3)

1. A compound of the structural formula

wherein X is a member of the class consisting of monocyclic aryl hydrocarbon radicals containing less than ten carbon atoms and lower cycloalkyl radicals containing five to six nuclear carbon atoms, A is a lower alkylene radical separating the oxygen and nitrogen atoms attached thereto by at least two carbon atoms, and NRR′ is a member of the class consisting of lower alkylamino radicals, lower dialkylamino radicals and radicals wherein R and R′ are combined to form an alkylene chain containing more than three and less than six carbon atoms in the heterocyclic nucleus formed thereby.

---

## 2,772,289



## BASIC ESTERS OF N-ARALKYL-N-ARYL-CARBAMIC ACIDS AND THE MANUFACTURE THEREOF

John W. Cusic, Skokie, Ill., assignor, by mesne assignments, to G. D. Searle & Co., Skokie, Ill., a corporation of Delaware

No Drawing. Application March 26, 1953, Serial No. 344,883

14 Claims. (Cl. 260—326.3)

1. An N-aralkyl-N-arylcarbamate of the structural formula

wherein Ar and Ar′ are members of the class consisting of aralyl, isocyclic aryl hydrocarbon and isocyclic halo-aryl radicals containing no more than 10 carbon atoms, A is a lower alkylene radical, B is a lower alkylene radical separating the oxygen and nitrogen atoms attached thereto by at least two carbon atoms and NRR′ is a member of the class consisting of lower alkylamino, lower dialkylamino, lower dialkenylamino, lower hydroxyalkyl-alkylamino, 4-(lower alkyl)-piperazino, morpholino radicals and radicals of the type $\overset{N}{\underset{Z}{\frown}}$ wherein Z is an alkylene radical containing more than three and less than ten carbon atoms and wherein more than three and less than six carbon atoms are in nuclear position.

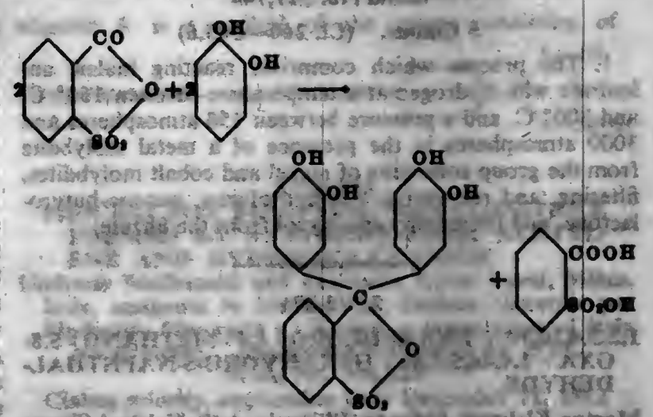
## 2,772,290

## PREPARING PYROCATECHIN-SULFONPHTHALEIN



Zdeněk Veselý, Prague Smichow, and Otakar Lemberger, Ústí n Labem, Czechoslovakia

No Drawing. Application May 25, 1954, Serial No. 432,306

Claims priority, application Czechoslovakia November 13, 1953

8 Claims. (Cl. 260—327)

1. Method of preparing pure crystalline pyrocatechin-sulfonphthalein, comprising condensing o-sulfobenzoic acid anhydride with pyrocatechin by melting said compounds in equimolar proportions at temperatures substantially between 100° and 110° C., the condensation taking place according to the following equation:

and purifying the raw pyrocatechin-sulfonphthalein obtained by causing the condensation product to crystallize, subjecting the crystals to recrystallization, and using glacial acetic acid for washing purposes.

8. Complexonometric indicator consisting of pyrocatechin-sulfonphthalein in a pure crystalline state.

---

## 2,772,291

## HYDROGENATION OF MALEIC ANHYDRIDE

Herbert F. Mellhaney, Jr., and Walter W. Gilbert, Wilmington, Del., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application August 31, 1953, Serial No. 377,718

3 Claims. (Cl. 260—343.6)

1. The process for the production of tetrahydrofuran, tetramethylene glycol, and gamma-butyrolactone which comprises reacting maleic anhydride with hydrogen at a temperature between 175° C. and 300° C. and a pressure between 500 p. s. i. and 12,000 p. s. i. in the presence of a catalyst obtained by the reduction with hydrogen of a mixture of nickel ammoniomolybdate and nickel ammoniochromate until the same contains at least traces of elemental nickel and has the approximate composition $(NiMoO_3)_a \cdot (Ni_xCr_yO_z)_b$ where $a:b=2:1$ to 1:2, $x:y=1.6:1$ to 2.2:1 and $z:y=2:1$ to 3:1.

2,772,292

## HYDROGENATION OF MALEIC ANHYDRIDE

Herbert F. Mathaus, Jr., Wilmington, Del., and Robert B. Ramsey, Jr., Penns Grove, N. J., assignors to E. I. du Pont de Nemours & Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application July 13, 1953, Serial No. 367,746

5 Claims. (Cl. 260—343.6)

1. The process for the production of tetrahydrofuran, tetramethylene glycol, and gamma-butyrolactone which comprises reacting maleic anhydride with hydrogen at a temperature between 175° C. and 300° C. and a pressure between 500 p. s. i. and 12,000 p. s. i. in the presence of a pyrophoric foraminous metal skeleton of the group consisting of nickel and cobalt skeletons remaining after the extraction of an alloying ingredient from an alloy thereof.

2,772,293

## PROCESS OF HYDROGENATING MALEIC ANHYDRIDE WITH A NICKEL OR COBALT MOLYBDITE CATALYST

Walter W. Gilbert, Wilmington, Del., and Benjamin W. Hawk, West Chester, Pa., assignors to E. I. du Pont de Nemours and Company, Wilmington, Del., a corporation of Delaware

No Drawing. Application July 13, 1953, Serial No. 367,744

5 Claims. (Cl. 260—343.6)

1. The process which comprises reacting maleic anhydride with hydrogen at a temperature between 160° C. and 300° C. and a pressure between 150 atmospheres and 3000 atmospheres in the presence of a metal molybdite from the group consisting of nickel and cobalt molybdites, filtering, and recovering tetrahydrofuran, gamma-butyrolactone, and tetramethylene glycol from the filtrate.

2,772,294

## 1,2,3,4,10,10 - HEXACHLORO - 1,4 - METHANO - 5,8-OXA - 1,4,4a,5,8,8a - HEXAHYDRO-5-NAPHTHALDEHYDE

Morton Kleiman, Chicago, Ill., assignor to Velsicol Chemical Corporation, a corporation of Illinois

No Drawing. Application July 14, 1953, Serial No. 367,969

1 Claim. (Cl. 260—346.2)

As a new composition of matter 1,2,3,4,10,10-hexachloro - 1,4 - methano - 5,8 - oxa - 1,4,4a,5,8,8a - hexa - hydro - 5 - naphthaldehyde.

2,772,295

## PROCESS OF MANUFACTURING ESTERS OF 3-SUBSTITUTED 2-FUROIC ACIDS

Donald M. Burness, Rochester, N. Y., assignor to Eastman Kodak Company, Rochester, N. Y., a corporation of New Jersey

No Drawing. Application February 2, 1953, Serial No. 334,720

6 Claims. (Cl. 260—347.5)

1. A process of manufacturing a lower alkyl ester of a 2-furoic acid substituted in the 3-position by a hydrocarbon substituent selected from the lower alkyl groups and the phenyl group, which comprises heating at a temperature of from about 160° C. to about 250° C., a lower alkyl ester of a 5,5-dimethoxy-2,3-epoxypentanoate substituted in the 3-position by a hydrocarbon substituent selected from the lower alkyl groups and the phenyl group.

2,772,296

## PROCESS FOR PREPARING EPOXY ESTERS

Albert C. Mueller, Berkeley, Calif., assignor to Shell Development Company, New York, N. Y., a corporation of Delaware

No Drawing. Application November 23, 1953, Serial No. 393,933

10 Claims. (Cl. 260—348)

1. A process for preparing an ester of an epoxy-substituted alcohol which comprises heating an unsubstituted hydrocarbon carboxylic acid of the class consisting of unsubstituted hydrocarbon monocarboxylic acids containing not more than 20 carbon atoms and unsubstituted hydrocarbon dicarboxylic acids containing not more than 20 carbon atoms with at least twice the chemical equivalent amount of a lower 1-chloro-2,3-epoxyalkane in the presence of a member of the group consisting of unsubstituted trialkylamines, unsubstituted tricycloalkylamines, unsubstituted triarylamines, pyridine, and quaternary ammonium salts wherein the substituents on the nitrogen are of the class consisting of lower alkyl groups and monocyclic aromatic hydrocarbon groups, and recovering 2,3-epoxyalkyl ester of said carboxylic acid from the reaction mixture.

2,772,297

## STEROL RECOVERY

Fritz O. Lasser, Philadelphia, Pa., Kathleen M. Lasser, executrix of said Fritz O. Lasser, deceased

No Drawing. Application February 16, 1953, Serial No. 337,215

12 Claims. (Cl. 260—397.25)

1. A method of obtaining sitosterol from a by-product of the refining of a sitosterol-containing oil and selected from the class consisting of the acidulated foots and still bottom pitches of such an oil, which method comprises treating such a by-product under saponifying conditions with sufficient of a water-soluble alkaline saponifying agent to saponify its saponifiable constituents, in presence of a water-soluble lower aliphatic alcohol; then mixing the saponification products with sufficient of a finely divided, water-insoluble drying-and-extraction-aid, non-reactive with the organic portion of said products and inert to, and insoluble in, the solvent to be used in the subsequent extraction step, at least to form a thick slurry, thereafter drying the slurry under conditions to avoid significant decomposition of the sitosterol; and extracting the sterols from the dry mixture with a sitosterol-solvent which is at least one member of the class consisting of acetone, ethylene dichloride, methanol, mixtures of methanol and ethylene dichloride, and ethyl acetate; and separating the sitosterol from the solvent.

2,772,298

## 11-OXYGENATED DERIVATIVES OF 13-METHYL-1,2,3,6,7,8,9,10,11,12,13,14,16,17 - TETRADECAHYDRO - 15H - CYCLOPENTA [a] PHENANTHRENE-3,17-DIONE

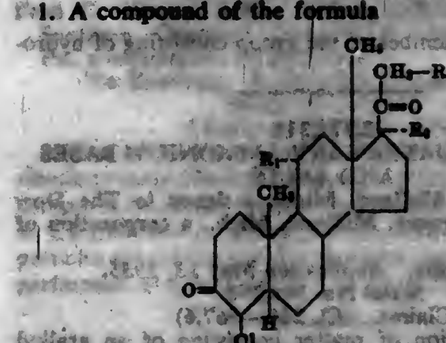
Leland J. Chinn, Morton Grove, Ill., assignor, by mesne assignments, to G. D. Searle & Co., Skokie, Ill., a corporation of Delaware

No Drawing. Application June 11, 1953, Serial No. 361,069

1 Claim. (Cl. 260—397.45)

11β - hydroxy - 13 - methyl - 1,2,3,6,7,8,9,10,11,12,13,14,16,17 - tetradecahydro - 15H - cyclopenta[a]phenanthrene-3,17-dione.

2,772,299



## 4-CHLORO-11α,17α-DIHYDROXYPREGNANES

Gunther S. Fonken, Kalamazoo, Robert H. Levin, Kalamazoo Township, Kalamazoo County, and A. Vern Meinzinger, Jr., Kalamazoo, Mich., assignors to The Upjohn Company, Kalamazoo, Mich., a corporation of Michigan

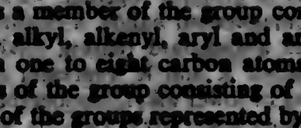
No Drawing. Application July 16, 1952, Serial No. 299,231

9 Claims. (Cl. 260—397.45)

1. A compound of the formula

wherein $R_1$ is a member of the group consisting of α-hydroxy and α-lower-alkanoyloxy; $R_2$ is a member of the group consisting of hydrogen and α-hydroxy; $R_3$ is a member of the group consisting of hydrogen, chlorine, bromine, and lower-alkanoyloxy; and wherein only one of $R_2$ and $R_3$ can be hydrogen.

2,772,300



## DITHIO-DIOCTANOIC ACIDS AND METHODS OF OBTAINING THE SAME

Arthur F. Wagner, Princeton, N. J., assignor to Merck & Co., Inc., Rahway, N. J., a corporation of New Jersey

No Drawing. Application July 22, 1954, Serial No. 445,179

32 Claims. (Cl. 260—399)

1. A disulfide compound selected from the group consisting of compounds of the formula

wherein R is a member of the group consisting of hydrogen, and an alkyl, alkenyl, aryl and aralkyl group containing from one to eight carbon atoms, and R' and R² are members of the group consisting of thio and hydroxy groups, one of the groups represented by R' and R² being thio.

2,772,301

## IMPROVING GEL STRENGTH OF VEGETABLE WAXES

Edward A. Wilder, Racine, Wis., assignor to S. C. Johnson & Son, Inc., Racine, Wis.

No Drawing. Application May 4, 1953, Serial No. 353,014

5 Claims. (Cl. 260—404.5)

1. A method of improving the gel strength of a wax of the group consisting of ouricuri, caranda, sugar cane, deresinated candelilla and esparto grass for use in polishes of the wax-solvent type, comprising esterifying from 40 to 85% of the free hydroxyl groups of said wax with an excess of a material selected from the group consisting of maleic, succinic and glutaric anhydrides at a temperature within the range of 120 to 150° C.

2,772,302

## PROCESS FOR THE PRODUCTION OF 11-BROMO-UNDECANOIC ACID

Werner Mitsch, Cesano Maderno (Milan), Luigi Notarbartolo, Milan, and Levio Sposa, Cesano Maderno (Milan), Italy, assignors to Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Brüning, Frankfurt am Main, Germany

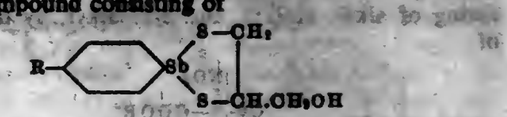
No Drawing. Application July 22, 1953, Serial No. 369,716

Claims priority, application Italy August 7, 1952

4 Claims. (Cl. 260—408)

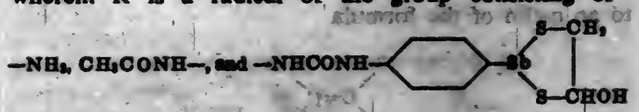
1. A process for the preparation of 11-bromo-undecanoic acid, comprising the step of reacting undecenoic acid with hydrobromic acid in the presence of a peroxide and in the absence of free oxygen.

2,772,303



## THERAPEUTIC ORGANOMETALLIC COMPOUNDS CONTAINING ANTIMONY AND SULFUR

Ernst A. H. Friedheim, New York, N. Y.



No Drawing. Original application January 28, 1947, Serial No. 724,925, now Patent No. 2,659,723, dated November 17, 1953. Divided and this application September 10, 1953, Serial No. 379,465

4 Claims. (Cl. 260—446)

1. As a new therapeutically active product, organometallic compound consisting of

wherein R is a radical of the group consisting of

—NH₂, CH₂CONH—, and —NHCONH—

2,772,304

## PROCESS FOR PURIFYING ACRYLONITRILE FORMED BY SYNTHESIS FROM ACETYLENE AND HYDROGEN CYANIDE

Umberto Mallarani and Fernando Alelgi Lazzi, Milan, Italy, assignors to Montecatini, Società Generale per l'Industria Mineraria e Chimica, a corporation of Italy

No Drawing. Application November 24, 1953, Serial No. 394,226

Claims priority, application Italy December 11, 1952

6 Claims. (Cl. 260—465.3)

1. The process of purifying acrylonitrile obtained by synthesis from acetylene and hydrogen cyanide and contaminated with hydrogen cyanide and lactonitrile, comprising treating the crude acrylonitrile at a temperature below 70° C., first with ferrous sulfate in an aqueous medium, then with an alkaline material in an aqueous medium, said alkaline material being selected from the group consisting of alkali-, alkali earth-, magnesium- and ammonium-hydroxides, carbonates and bicarbonates, using stoichiometric amounts of ferrous sulfate and said material with respect to the sum of free hydrogen cyanide and hydrogen cyanide present in form of lactonitrile to form alkaline ferrocyanide, permitting the reaction mixture to separate into two layers, separating the two layers and recovering the bulk of purified acrylonitrile from the upper of said two layers.

2,772,305

## OXIDATION OF TOLUATE ESTERS AND XYLENE MIXTURES

Irving E. Levine, Albany, and William G. Toland, Jr., San Rafael, Calif., assignors to California Research Corporation, San Francisco, Calif., a corporation of Delaware

No Drawing. Application August 26, 1952, Serial No. 306,497

3 Claims. (Cl. 260—475)

1. An oxidation process which comprises forming a liquid mixture of a xylene and an ester of toluic acid

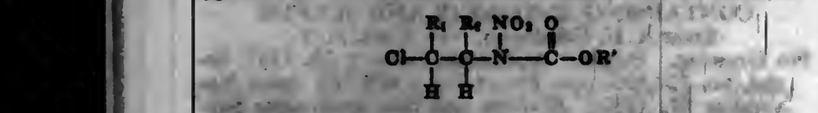
with an alkanol containing 1 to 4 carbon atoms and pass-

proportion methanol:ethanol being in the range 1:4 contacting a hot contact material at a pressure not less

with an alkanol containing 1 to 4 carbon atoms and passing a free oxygen-containing gas through the liquid mixture at a temperature in the range from 200° F. to 400° F., the mol ratio of toluic acid ester to xylene in the liquid mixture being in the range 1:5 to 5:1.

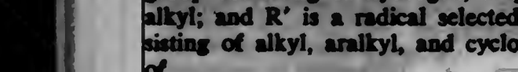
---

2,772,306



**PROCESS FOR THE PREPARATION OF CHLORO-NITRO-CARBAMIC ACID ESTER**

George R. Thomas, Brookline, Mass.



No Drawing. Application May 10, 1954, Serial No. 428,798

8 Claims. (Cl. 260—482)

1. A process for the preparation of a compound of the type

wherein $R_1$, $R_2$ are substituent radicals selected from the group consisting of hydrogen, alkyl, aralkyl, and cycloalkyl; and R' is a radical selected from the group consisting of alkyl, aralkyl, and cycloalkyl; by the addition of

to an olefin of the formula

at a temperature below the decomposition temperature of the N-chloro-N-nitrocarbamate.

---

2,772,307

**PROCESS FOR PREPARING ETHYLENE SULFONYL CHLORIDE**

Harold F. Park, East Longmeadow, Mass., assignor to Monsanto Chemical Company, St. Louis, Mo., a corporation of Delaware

No Drawing. Application March 19, 1953, Serial No. 343,518

5 Claims. (Cl. 260—543)

1. A process for preparing ethylene sulfonyl chloride in high yield which comprises reacting divinyl disulfide with substantially 4 mols of water and substantially 5 mols of chlorine per mol of divinyl disulfide, said reaction being carried out at a temperature of about 0–40° C. in solution in a solvent capable of at least partially dissolving said compounds, said solvent being resistant to reaction with said compounds and the products of said reaction, no substantial amount of said chlorine being added in the absence of said water.

---

2,772,308

**CYCLOALKANE PHOSPHONYL CHLORIDES**

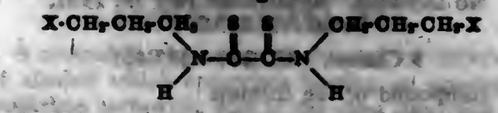
Warren Jensen, Ponca City, Okla., and James O. Clayton, Berkeley, Calif., assignors to California Research Corporation, San Francisco, Calif., a corporation of Delaware

No Drawing. Application July 6, 1954, Serial No. 441,665

1 Claim. (Cl. 260—543)

The compound, cyclohexane phosphonyl dichloride.

2,772,309



**DITHIOOXAMIDES**

Mona Phyllis Dorman, Walnut Creek, Calif., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Application August 12, 1954, Serial No. 449,497

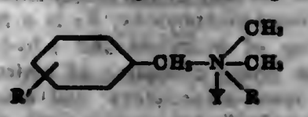
3 Claims. (Cl. 260—551)

1. A dithiooxamide having the formula

wherein X is a member of the group consisting of hydrogen and methyl.

---

2,772,310



**ARALKYL QUATERNARY AMMONIUM BASES AND SALTS**

Lee R. Morris, Midland, Mich., assignor to The Dow Chemical Company, Midland, Mich., a corporation of Delaware

No Drawing. Application May 13, 1955, Serial No. 508,298

9 Claims. (Cl. 260—567.6)

1. A composition of matter consisting of an aralkyl quaternary ammonium compound having the formula:

wherein R represents an alkyl radical containing from 12 to 18 carbon atoms, R' is a member of the group consisting of the 2-bromoethyl radical and the vinyl radical and Y is an anion selected from the group consisting of the chloride, bromide, nitrate, sulfate and hydroxide ions.

---

2,772,311

**HYDROGENATING KETIMINOMAGNESIUM HALIDE INTERMEDIATES WITH LITHIUM ALUMINUM HYDRIDE TO PRODUCE AMINES**

Albert Pohland, Indianapolis, Ind., assignor to Eli Lilly and Company, Indianapolis, Ind., a corporation of Indiana

No Drawing. Application June 29, 1953, Serial No. 364,953

5 Claims. (Cl. 260—570)

1. A process for the preparation of carbinamines, which comprises the steps of bringing together, with the formation of a ketiminomagnesium halide, a nitrile having the formula RCN, and a Grignard reagent having the formula R'MgX, wherein R and R' represent members of the group consisting of lower alkyl, monocarbocyclic aryl, and phenyl-substituted lower alkyl radicals, said radicals being free from substituents which are capable of reacting with a Grignard reagent, and X represents a halogen atom; and hydrogenating the resulting product with lithium aluminum hydride.

---

2,772,312

**PREPARATION OF N:N'-DIBENZYL ETHYLENE DIAMINE**

John Southwood, Henham, England, assignor to The Distillers Company Limited, Edinburgh, Scotland, a British company

No Drawing. Application December 20, 1954, Serial No. 476,541

Claims priority, application Great Britain December 31, 1953

5 Claims. (Cl. 260—570.9)

1. A process for the production of N:N'-dibenzyl ethylene diamine which comprises reducing N:N'-dibenzylidene ethylene diamine with an excess of metallic sodium and a mixture of methanol and isopropanol, the

proportion methanol:isopropanol being in the range 1:4 to 1:6 by weight and the weight of said mixture being from 4 to 5½ times the weight of the N:N'-dibenzylidene ethylene diamine, at a temperature approximating the refluxing temperature of the reaction mixture at atmospheric pressure.

---

2,772,313

**REDUCTION OF META CHLORO NITROBENZENE TO META CHLORO ANILINE**

Fred C. Tinger, Akron, Ohio, assignor to Columbia-Southern Chemical Corporation, Allegheny County, Pa., a corporation of Delaware

No Drawing. Application August 17, 1953, Serial No. 374,821

8 Claims. (Cl. 260—580)

1. The method of preparing a metahaloaniline without simultaneously effecting substantial dehalogenation which comprises treating a metahalonitrobenzene with hydrogen in the presence of a catalytic quantity of finely divided particles containing metallic rhodium, said treatment being performed at a temperature of from 25° C. to 180° C.

---

2,772,314

**PREPARATION OF SUBSTITUTED CYCLOOCTATETRAENES**

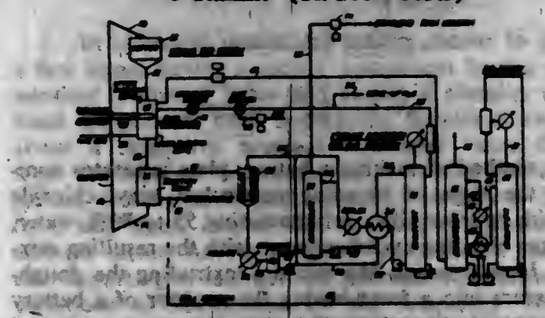
Hugh C. Campbell, Niagara Falls, N. Y., and Arthur C. Cope, Belmont, Mass., assignors to Research Corporation, New York, N. Y., a corporation of New York

No Drawing. Application June 20, 1952, Serial No. 294,731

15 Claims. (Cl. 260—666)

1. The method of preparing substituted cyclooctatetraenes which consists in the copolymerization at elevated temperature and pressure of acetylene with substituted acetylenes wherein the substituent is a hydrocarbon radical in the presence of a catalyst containing nickel in ionic combination and an anhydrous organic solvent.

---



2,772,315

**DEHYDROGENATION PROCESS**

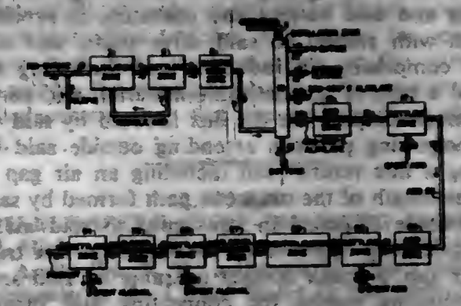
Stuart T. Haddan, Woodbury, N. J., assignor to Socony Mobil Oil Company, Inc., a corporation of New York

Application June 19, 1952, Serial No. 294,303

6 Claims. (Cl. 260—683.3)

1. The process of dehydrogenation of saturated lower hydrocarbons with sulfur dioxide which comprises: contacting a hot contact material at a pressure not less than atmospheric with a mixture of sulfur dioxide and saturated lower hydrocarbons for a period of time sufficient to effect dehydrogenation of the hydrocarbons, whereby the contact material is cooled by the reaction, withdrawing the products from said contact material, separating out from the product the hydrogen sulfide formed by the dehydrogenation reaction, burning the hydrogen sulfide with an oxygen-containing gas in proportions sufficient to effect a release of heat with the production of hot sulfur dioxide-containing combustion gases, and contacting the contact material cyclically with the hot combustion gases to reheat the contact material.

---



2,772,316

**MANUFACTURE OF ODORLESS AND ODOR-STABLE MINERAL OIL**

Sidney Schneider, Cranford, N. J., assignor to Esso Research and Engineering Company, a corporation of Delaware

Application March 2, 1953, Serial No. 339,597

10 Claims. (Cl. 260—683.4)

1. Process of manufacturing substantially odorless and odor-stable mineral oils which comprises alkylating a low-boiling isoparaffin hydrocarbon with a low-boiling olefin hydrocarbon, fractionating the resulting alkylate into a plurality of fractions including a fraction boiling within the range of about 330° F. to 550° F., acid-treating said fraction with concentrated sulfuric acid, neutralizing the acid-treated fraction with an alkali, and washing the neutralized fraction with an aqueous aliphatic alcohol.

---

2,772,317

**POLYMERIZATION CATALYST AND PROCESSES**

John O. Smith, Jr., North Plainfield, and Isidor Kirshenbaum, Union, N. J., assignors to Esso Research and Engineering Company, a corporation of Delaware

No Drawing. Application March 28, 1952, Serial No. 279,207

9 Claims. (Cl. 260—683.15)

8. A process for polymerizing normally gaseous olefins which comprises contacting the olefins with a substantially dry solid catalyst comprising 25 to 90% by weight oxalic acid supported on a solid siliceous adsorbent material at a temperature in the range of about 200°–450° F. whereby substantial polymerization of olefins takes place.

## ELECTRICAL

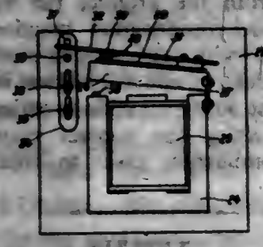
2,772,318

**APPARATUS FOR VAPORIZATION OF METALS AND METALLOIDS**

Leslie Arthur Holland, South Norwood, London, England

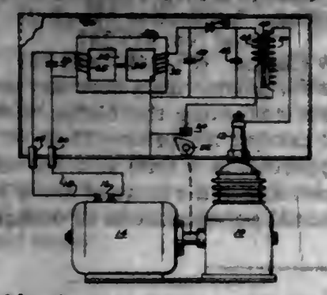
Application December 31, 1953, Serial No. 401,667

Claims priority, application Great Britain December 31, 1953



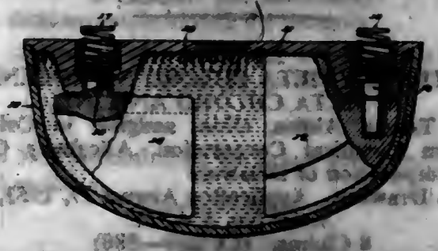
6 Claims. (Cl. 13—25)

1. An apparatus for vaporisation of materials consisting of metals and metalloids comprising an evaporator base composed of refractory material, a heat radiator having an opening therein surrounding said base whereby the said material during evaporation flows over into said



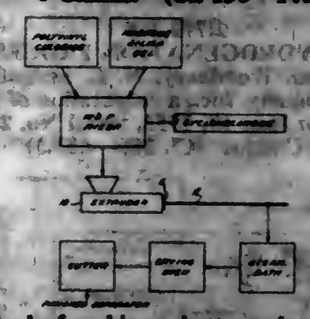
opening, and means for heating the radiator in order that the heat for the evaporation is applied by radiation from the radiator to the base.

2,772,319
**AUXILIARY DEVICE IN IGNITION SYSTEMS OF COMBUSTION MOTORS**
Nils Evert Fridolf Holmqvist and Stig Per Robert Almeros, Stockholm, Sweden
Application December 28, 1951, Serial No. 263,779
2 Claims. (Cl. 123—148)



1. An auxiliary device for use in the ignition system of an internal combustion engine having a drive shaft, said ignition system comprising a battery, an ignition coil having a primary winding and a secondary winding, said primary winding being connected to said battery, and a circuit breaker including contacts connected in series with an energizing circuit including said primary winding and said battery and operating in synchronized relation with respect to said drive shaft, said auxiliary device comprising an induction coil including a winding and a core of magnetizable material, said core forming a magnetic path for the flux induced by said winding and comprising portions extending outside said coil for forming a flux return path including an air gap shorter than the length of the magnetic path formed by said core, an armature disposed in proximity to said air gap to be magnetically operable by the magnetic flux traversing said air gap, a break contact operable by said armature, and switching means for connecting said magnetizing winding in parallel with said primary winding of the ignition coil and connecting said break contact in parallel with said contacts of said circuit breaker, the said induction coil being so dimensioned that the ratio of its inductance to the square of its resistance is considerably greater than the ratio of the inductance of said primary winding of said ignition coil to the square of the resistance thereof.

2,772,320
**ENGINE IGNITION SYSTEMS OR THE LIKE**
Clarence B. Knudson, Los Angeles, and James L. Bate, Sun Valley, Calif., assignors to Hoffman Electronics Corporation, a corporation of California
Application September 4, 1953, Serial No. 378,614
6 Claims. (Cl. 123—148)



1. In combination, an alternator having output terminals and an internal-combustion engine mechanically coupled to said alternator and including an ignition system, said ignition system including a regulating transformer having a pair of input terminals coupled to said alternator output terminals and a pair of output terminals, a rectifier and a storage capacitor serially connected across said regulating transformer output terminals, an ignition transformer having primary and secondary windings, and a contact maker, said primary of said ignition transformer and said contact maker being electrically connected in series across said storage capacitor.

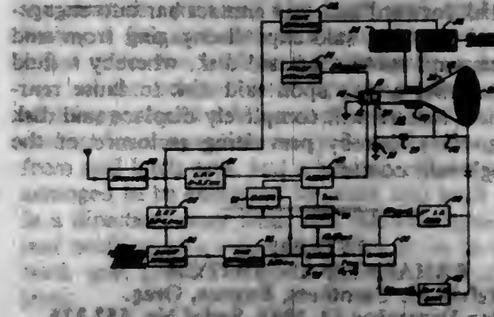
2,772,321
**VOLTAIC CELL CATHODE AND ART OF MAKING THE SAME**
George G. Eusign, Elgin, Ill., assignor to Elgin National Watch Company, Elgin, Ill., a corporation of Illinois
Application July 3, 1952, Serial No. 297,011
13 Claims. (Cl. 136—120)

13. A coherent and self-supporting composite cathode structure for an electrical energy producing cell, comprising particles of depolarizing material which decreases in volume during its depolarizing action and is of relatively low electrical conductivity, particles of material of relatively high electrical conductivity, and ½ to 4 percent by weight of electrolyte-resistant plastic capable of flowing under pressure into coherent binding condition and forming a connected network of connected septa within the electrically-conductive coherent cathode mass, said cathode being a compressed compact mass having a porosity of 4 to 15 percent and effective for the absorption of aqueous liquids and said particles being intimately mixed and in conductive relation with one another and held by the plastic against separation and migration.

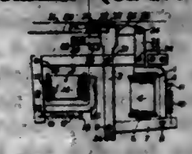
2,772,322
**MICROPOROUS VINYL CHLORIDE RESIN AND METHOD OF MAKING SAME**
Harry S. Witt, East Paterson, N. J., and Frank S. Martin, Cranston, R. I., assignors to United States Rubber Company, New York, N. Y., a corporation of New Jersey
Application August 5, 1953, Serial No. 372,466
8 Claims. (Cl. 136—146)

5. A method of making a battery plate separator comprising the steps of blending particulate vinyl chloride resin with hydrous silica gel containing 55 to 80% water, thereafter blending cyclohexanone with the resulting mixture to form a dough-like mixture, extruding the dough-like mixture into a form having the contour of a battery plate separator, exposing the separator to a saturated steam to remove the cyclohexanone therefrom without removing water from the silica gel, thereby fixing the mass in the said desired form while the said water is still present in the gel, and subsequently dehydrating the silica gel by such a length of time and temperature as to cause the gel to shrink within said mass and to provide microporous voids within the mass, said mass having a resulting porosity of at least 65%.

2,772,323
**WIRE CONNECTOR**
Theodore C. Smith, Drexel Hill, Pa.
Application September 29, 1952, Serial No. 311,998
6 Claims. (Cl. 174—87)

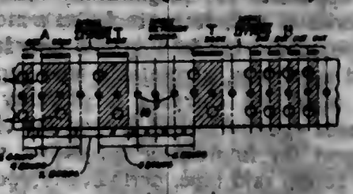


6. A wire connector including a body of insulating material having a conical cavity therein open at one end and closed at the other end, and a conical coiled wire sleeve in said cavity to receive the bared ends of flexible conductors, the coils of said sleeve adjacent the open end of the body being closely wound and fitting threaded walls of the cavity and the coils adjacent the closed end of the body being spaced axially further apart to provide



substantial interstices, said body being further characterized by the provision of an unthreaded pocket at the closed end into which the widely spaced coils of the sleeve project whereby when the bared ends of conductors and the bottom of the pocket engage one another during rotation of the connector said bared ends of conductors will be forced laterally into the interstices.

2,772,324
**ELECTRICAL SYSTEMS**
Wilson P. Boothroyd, Huntingdon Valley, Pa., assignor to Philco Corporation, Philadelphia, Pa., a corporation of Pennsylvania
Application September 16, 1952, Serial No. 309,831
19 Claims. (Cl. 178—5.4)



1. An electrical system comprising means to produce a first signal having a carrier component having a given nominal frequency value and having a plurality of sideband components each undergoing frequency variations about a respective nominal frequency value different from the nominal frequency value of said carrier component, first signal channel means for selectively deriving from said signal one of said sideband components, said channel means having a signal transmission characteristic imparting to said derived sideband component phase variations as determined by the frequency variations thereof, second signal channel means for selectively deriving from said signal another of said sideband components, said second channel means having a signal transmission characteristic imparting to said derived other sideband component phase variations as determined by the frequency variations thereof, and heterodyne means coupled to said first and second channel means for combining said derived sideband components thereby to produce an output signal having a nominal frequency value equal to the difference between the nominal frequency values of said derived sideband components, having frequency variations equal to the difference between the frequency variations of said derived sideband components and having phase variations equal to the difference between the phase variations of said derived sideband components.

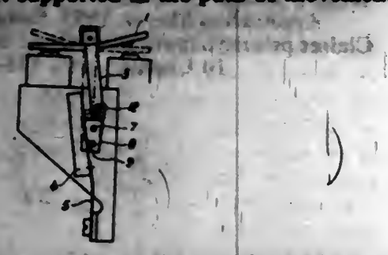
2,772,325
**MECHANISMS FOR PRODUCING STEP-BY-STEP LINEAR DRIVE**
Harold D. Gaite, Taplow, England, assignor to British Telecommunications Research Limited, Taplow, England, a British company
Application May 4, 1953, Serial No. 352,937
Claims priority, application Great Britain May 5, 1952
10 Claims. (Cl. 178—17)

1. A step-by-step linear drive mechanism for causing the operative end of an elongated drive member to perform a rectangular movement, comprising a first electromagnet, a first spring, means effective on the energisation of said first electromagnet for moving said drive member in the direction of its length against the tension of said first spring, a second electromagnet, a second spring, means effective on the operation of said second electromagnet for moving the operative end of said drive member substantially at right angles to its length against the tension of said second spring, and means for repeatedly energising both said electromagnets at the same frequency and for the same periods but with a predetermined time displacement such that the periods of energisation overlap.

2,772,326
**VARIABLE-SPEED CODE-TRAINING DEVICES**
John H. Hickey, Port Washington, and Louis M. Mittelsdorf, Amityville, N. Y., assignors, by direct and mesne assignments, to the United States of America as represented by the Secretary of the Navy
Application July 29, 1952, Serial No. 301,472
6 Claims. (Cl. 178—115)

5. Training apparatus comprising a movable tape record having thereon spaced indicia corresponding to intelligence, means translating said indicia into signals and transmitting the latter in a form receivable by a trainee for identification, means responsive to the occurrence of a space between adjacent indicia for interrupting the movement of said record for a predetermined time, said interrupting means comprising a timing circuit comprising an R-C network adapted to be charged during the interval that indicia are translated and discharged during the interval between adjacent indicia, and means operable to initiate the movement of said record at the end of said predetermined time.

2,772,327
**DAMPING MEANS FOR SELECTING BARS IN CROSSBAR SWITCHES**
Gunnar Daniel Olsson, Stockholm, Sweden
Application December 28, 1951, Serial No. 263,809
5 Claims. (Cl. 179—27.54)



1. A crossbar switch comprising a support having a selecting bar selectively rotatable in either of two directions from a neutral position upon energization of either of two oppositely arranged electromagnets, a pair of spaced stop members, means supporting said stop members for swingable movement substantially in a common plane, means operatively connected with said selecting bar and operatively engaging said supporting means for

said casing being furnished with a removable cover and al-

actuation of the latter so as to cause said stop members to move in mutually opposite directions on rotation of the selecting bar in a respective one of its rotating directions, and a spring urged braking device including a massive brake weight supported in the path of movement

in the respective directions of the said stop members, the selecting bar on rotation in either of the two rotating directions from its neutral position urging one of said stop members against said braking device to actuate said brake weight in the respective direction.

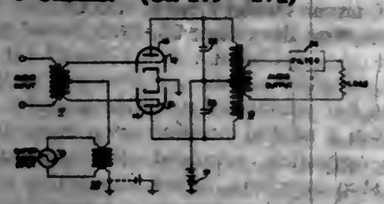
**AUTOMATIC SYNCHRONIZATION APPARATUS FOR LONG-TIME TRANSVERSE MAGNETIC SOUND RECORDER AND REPRODUCER**

William H. Lyon, Orange, Conn., assignor to The Soundscriber Corporation, New Haven, Conn., a corporation of Connecticut

Application April 28, 1952, Serial No. 284,716
12 Claims. (Cl. 179—100.2)

1. In an apparatus for magnetically recording intelligence as a series of transverse tracks on a moving flexible magnetic tape, means for feeding said tape longitudinally through said apparatus, a rotatable tape support located under said tape and carrying a plurality of electromagnetic heads equally spaced around the circumference of said support for impressing successive, spaced transverse tracks across said tape, periodically operated means actuated by a small movement of said tape to stop it automatically for a short interval of time to reduce the clearance between successive recorded transverse tracks and the path of said heads in order to compensate for misalignment which may have occurred due to shrinkage or expansion of said tape, so as to bring said recorded tracks back into proper synchronism with the path of said transducer heads, and cam means on said rotatable support to automatically start the feeding of said tape again.



---

2,772,329

**CORRECTION OF DISTORTION IN PUSH-PULL AMPLIFIERS**

John M. Miller, Jr., Baltimore, Md., assignor to Bendix Aviation Corporation, Towson, Md., a corporation of Delaware

Application February 23, 1951, Serial No. 212,441
3 Claims. (Cl. 179—171)

1. An amplifier circuit comprising two electron discharge tubes having their input and output circuits connected for push-pull operation, a source of alternating current voltage having a frequency above the signal frequency range, said source deriving said alternating current voltage independently of alternating current voltages existing in the remainder of said amplifier circuit, means applying the voltage of said source cophasally to said input circuits as bias voltage, load means recovering from the output circuits of said tubes the energy content within the signal frequency range, and means in said output circuits removing therefrom energy having the frequency of said alternating current voltage.

---

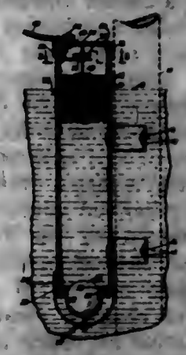
2,772,330

**SENSITIVE PRESSURE SWITCH**

Roger K. Higgins, Takoma Park, Md., assignor to the United States of America as represented by the Secretary of the Navy

Application November 17, 1952, Serial No. 320,968
1 Claim. (Cl. 200—83)

A sensitive pressure switch comprising, a flat plate having an aperture formed therein, a disk loosely fitting within said aperture, a pair of contacts oppositely disposed adjacent the periphery of said aperture, a contact bar on said disk and extending beyond the edges thereof for engaging said contacts to complete a circuit therethrough, said bar preventing forward movement of said disk from said aperture, and a pair of spring clips on said plate and engaging said disk near the edge thereof for urging said disk forward and said contact bar into engagement with said contacts, said clips disengaging from said disk upon rearward motion of said disk, whereby a fluid pressure differential acting upon said disk to cause rearward movement thereof will completely displace said disk from said aperture thereby preventing reclosure of the circuit through said contacts.



---

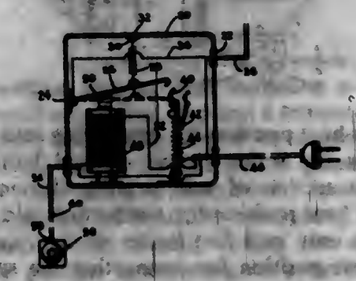
2,772,331

**EXHAUST FAN SWITCH**

Melvin M. Carothers, Eugene, Oreg.

Application December 12, 1955, Serial No. 552,328
7 Claims. (Cl. 200—84)

1. A time delay switch for mounting in a tank in which the level of water is varied between two spaced levels, said switch comprising a vertically extending casing, means for supporting said casing in said tank with the lower portion of said casing below the upper and above the lower water level in said tank, a valve for discharging water from said lower portion when the water level in said tank falls below said valve and for preventing entrance of water into said casing when said water level rises above said valve, said casing having an opening through a wall thereof below said upper level of water in said tank for controlled entrance of water into said casing, a float in said casing having an upper and lower position, and an electrical contact actuated by said float to complete an electric circuit when said float is in one of said positions and to break said circuit when said float is in the other of said positions.



2,772,332

**ROOM VENTILATOR**

Viola M. Carlson, Barrett, Minn.

Application July 16, 1954, Serial No. 443,879
1 Claim. (Cl. 200—88)

In a device of the character described, a support, a vertical electromagnet mounted on said support, a vertical thermally distortable and insulated latch arm positioned alongside of said electromagnet, said latch arm having an upper end provided with a lateral projection directed toward said electromagnet and a lower end secured to said support, an insulated horizontal contact lever overlying and spaced above said electromagnet and having an armature thereon, said contact lever having an end pivoted on said support and providing for upward and downward swinging of said contact lever relative to the electromagnet and said latch arm, said contact lever having a free end normally securably and releasably engaged under the latch arm projection in a depressed position of the contact lever, spring means acting between said support and said contact lever yieldably urging said contact lever upwardly away from the electromagnet and from said latch arm, and a heating coil on said latch arm arranged to be energized to cause said latch arm to move in a direction away from said electromagnet from a normal position to a release position so as to disengage the latch arm projection from the free end of the contact lever.

---

2,772,333

**THERMAL CONTROL FUSES**

Leslie Pett, Heaton Norris, Stockport, England

Application December 3, 1954, Serial No. 472,967
Claims priority, application Great Britain
December 15, 1953
7 Claims. (Cl. 200—117)

1. A thermal control fuse adapted for intercalation in an electric circuit, including a casing housing electrical terminals mounted in an insulation block in said casing, said casing being furnished with a removable cover and also with an attachable basal member provided with a tubular metal sheath, an insulation member located in said sheath having holes for the passage of two terminal wires, the upper ends of which project into the aforesaid casing and are connected to the respective terminals, while the lower ends extend through the insulation member, a further metal sheath connectible to the first-mentioned sheath and housing continuations of the insulation member and the terminal wires, a distance piece in said second-mentioned sheath located between the underside of the insulation member and an insert stop secured to the end of said second-mentioned sheath, a fuse element secured across the ends of the terminal wires in such manner that the said terminal wires are held in tension whereby the said fuse element is subjected to a predetermined tensile stress, and means for securing the respective sheaths together.

---

2,772,334

**REFRACTORY BODY FOR ELECTRICAL APPARATUS**

André Latour, Grenoble, France, assignor to Etablissements Merlin & Gerin, Société Anonyme, Grenoble, France, a corporation of France

Application March 8, 1952, Serial No. 275,639
Claims priority, application Belgium March 28, 1951
4 Claims. (Cl. 200—144)

1. Arcing plates for circuit breakers, switches and the like electrical apparatus comprising a porous refractory body consisting essentially of grains of a refractory insulating substance bonded together by autogenous fritting only at the contacting areas of their surfaces to leave a substantial portion of voids between said grains.

---

2,772,335

**CIRCUIT BREAKERS**

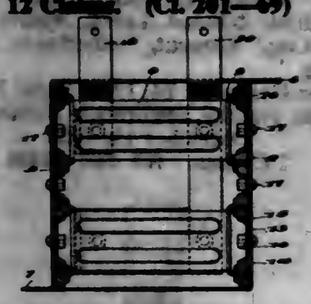
Hendrik A. Hilde Nijland, Laren, Netherlands, assignor to N. V. "Coq," Utrecht, Netherlands, a company of Netherlands

Application December 14, 1954, Serial No. 475,158
Claims priority, application Netherlands
December 19, 1953
2 Claims. (Cl. 200—148)

1. A circuit-breaker in which the arc caused by the switching operation is extinguished by compressed gas, comprising a plurality of tubes of insulating material, at least two electrically conductive contact holders supported and kept spaced apart by said tubes, at least two annular switching contacts supported by said contact holders, the central opening of each switching contact being kept closed when the circuit breaker is in its closed position but being opened during the opening operation of the circuit breaker, and gas-outlet means connected to the central openings of said switching contacts,

said tubes of insulating material forming a portion of said gas-outlet means, said gas-outlet means enabling the extinguishing gas passing through said opening to flow to the outside, the tubes of insulating material being connected to the central opening of one switching contact only and passing through the contact holder of the other switching contact, said tubes of insulating material opening at a distance beyond the latter contact holder, thereby preventing the gas discharged by said tubes from coming into contact with said latter contact holder.

---

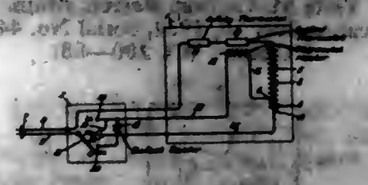


2,772,336
INFRA-RED GENERATOR
Herman A. Merrick, Seattle, Wash., assignor, by mesne assignments, to United Service & Utilities Co., Seattle, Wash., a corporation of Washington
Application July 10, 1953, Serial No. 367,227
1 Claim. (Cl. 201—63)

An infra-red generator comprising a glass tube, ceramic terminal plugs extending by necked-down portions into said tube and having enlarged heads without the tube; said plugs each having a longitudinal bore and a groove in the outer end face of its enlarged head extending laterally from the said bore to the side extremity of the head, a wire coil assembly in the tube and having extensions passing endwise through the said bores and seated in the said grooves, said extensions having asbestos jackets, and cement bonding the plugs to the tube, holding the jacketed extensions in the grooves, and sealing the said bores in the plugs.

---

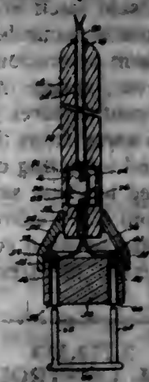
2,772,337
RESISTOR STRUCTURE
Robert E. Du Bois, Hammond, Ind.
Application November 12, 1953, Serial No. 391,566
12 Claims. (Cl. 201—69)



1. A resistor structure comprising a mounting frame including top and bottom frame members, a plurality of insulator strips, said strips being provided with a plurality of spaced holes, clip means cooperating with said strips to secure the strips to the top and bottom frame members, and resistor means with a plurality of grid elements carried by said insulator strips, the said resistor means cooperating with the spaced holes along said insulators to permit longitudinal expansion and contraction of the grid elements under varying grid temperature conditions.

---

2,772,338
HEATING DEVICE CONTROL CIRCUIT
George C. Crowley, Asheboro, N. C., assignor to General Electric Company, a corporation of New York
Application December 30, 1954, Serial No. 478,842
6 Claims. (Cl. 219—20)



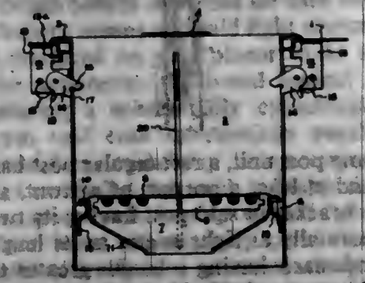
1. A heating device and a control for varying the temperature of said heating device, comprising means for connecting said control to said heating device, said heating device including a heating element having a first section and a second section, a thermostat for controlling said heating element, a thermostat heater for said thermostat, one end of said thermostat heater being connected to said heating element at the common point of said sections, a ballast resistor connected between the other end of said thermostat heater and said first section of said heating element, said ballast resistor being disposed remote from said heating device, said control being mov-

able to a low heat position for connecting said thermostat heater across the series circuit of said ballast resistor and said first section of said heating element, movable to a medium heat position for connecting said thermostat heater across only said first heater section, and movable to a high heat position for connecting the series circuit of said thermostat heater and said ballast resistor across said first section of said heating element, said circuits in all positions of said control being completed through said second section of said heating elemeat.

---

2,772,339
ELECTRIC BRANDING IRON
Ralph O. Bennett, Alfalfa, and Edmund J. Welchel, Cotney, Okla.
Application April 8, 1955, Serial No. 500,133
2 Claims. (Cl. 219—30)

1. An electric branding iron comprising an elongated handle having an axial bore therethrough, said handle having an enlarged cavity communicating with the bore intermediate opposite ends of the handle; an electrically conductive cord extending through said bore of the handle and including a pair of leads, one of said leads extending continuously through the cavity, the other lead terminating within the cavity; an electrical rheostatic device mounted in said cavity and including an operating handle disposed exteriorly of the handle, said device including spaced terminals to one of which the other lead of the cord is connected; a lead connected to the other terminal of the rheostatic device and projecting with the first named lead out of the handle; a connecting member attached to the handle and extending about the first named and the last named leads; an electrically insulative block secured to said connecting member; a pair of spaced electrically conductive sleeves mounted in said block, said one lead and the last named lead being connected to said sleeves; and a brand formed from a length of electrically conductive rod material having its ends removably engaged in said sleeves, said brand being formed of a material adapted to heat responsive to the passage of electrical current therethrough.



2,772,340
SURFACE HEATING UNIT
George W. Schroeder, Louisville, Ky., assignor to General Electric Company, a corporation of New York
Application October 11, 1954, Serial No. 461,559
5 Claims. (Cl. 219—37)

1. In a surface heating unit including a horizontally disposed utensil supporting grid and a temperature sensing device centrally located therein so as to contact the bottom of a utensil resting on said grid, a generally concave drip pan of high thermal conductivity having a central opening defined by an upwardly projecting tubular portion surrounding said sensing device, the upper end of said tubular portion terminating in a horizontal flange above the plane of said grid, and spring means for resiliently supporting said pan so that said horizontal flange is biased into contact with the bottom of said utensil.

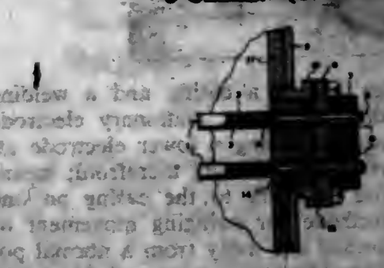
---

2,772,341
ELECTRIC HEATING APPLIANCE
Walter E. Lewis, Louisville, and Samuel C. Jordan, Lynden, Ky., assignors to General Electric Company, a corporation of New York
Application December 2, 1954, Serial No. 472,642
6 Claims. (Cl. 219—37)

1. An electric heating appliance comprising frame structure including a horizontal wall having an opening therein, a tubular shell vertically arranged in said opening, means for supporting said shell with its upper end lying substantially in the plane of said wall, a heating unit horizontally arranged in said shell, means for supporting said heating unit in said shell adjacent the lower end thereof, a plurality of vertical slots in said shell, a plurality of latch means mounted on said frame adjacent said wall, each of said latch means including a pivoted arm having its free end projecting through one of said slots in said shell, said pivoted arm being movable into latching engagement with said heating unit upon upward movement of said shell to a first predetermined position so as to engage said heating unit with said pivoted arm, and said pivoted arm being movable out of engagement with said heating unit upon upward movement of said shell to a second predetermined position, whereby said heating unit may be positioned either at the bottom of said shell or substantially in the plane of said wall by vertical movement of said shell.

---

2,772,342
FLUID CIRCULATION TYPE ELECTRIC BASE-BOARD SPACE HEATER
Loyal B. Reynolds and Harry G. Welch, Seattle, Wash.
Application July 8, 1954, Serial No. 442,132
2 Claims. (Cl. 219—38)



1. A fluid type base-board space heater comprising a horizontal upper run of pipe; a horizontal lower run of pipe positioned parallel with and in spaced relation below said upper run of pipe, said lower run of pipe having at one end a fluid heating chamber provided with a top wall which is vertically offset above the top wall of the remainder of said lower run of pipe; an electric heating element extending into said fluid heating chamber; a fluid conduit communicatively connecting the uppermost portion of said fluid heating chamber with the adjacent end of said upper run of pipe; another fluid conduit communicatively connecting the end portions of said two runs of pipe remote from said heating chamber, said two runs of pipe and end connecting fluid conduits forming a closed

fluid circulation loop which is sealed against the escape of fluid, the upward vertical offset of the upper wall of the fluid heating chamber relative to the upper wall of the remainder of the lower run of pipe predetermining the direction of circulation of fluid in the loop and causing heated fluid from the chamber to flow first through said upper run of pipe and then through said lower run of pipe back to the chamber, and expansion chamber means extending above and communicating with the uppermost portion of said upper run of pipe, said expansion chamber insuring silent operation and maintaining low pressure in said closed and sealed fluid circulation loop.

---

2,772,343
ELECTRIC IMMERSION HEATER
Willis G. Beaino, Louisville, Ky., assignor to General Electric Company, a corporation of New York
Application May 19, 1954, Serial No. 430,839
5 Claims. (Cl. 219—39)

5. An electric immersion heater of the type adapted to be mounted in an opening in a water heater tank comprising a sheathed heating element, a mounting plate joined to said heating element adjacent one end thereof and provided with a flanged portion adapted to be secured to said tank, and a block of hydraulic cement secured to the face of said plate which overlies said opening, said block having a shape corresponding to the shape of the opening and extending therethrough so that all portions of the walls of said opening are in close proximity to the surface of said block.

---

2,772,344
ELECTRIC WATER HEATER
Max E. Bowen, Joseph A. Hanish, and Theodore E. Carlson, Wixom, Mich., assignors to Handling Equipment & Manufacturing Company, Wixom, Mich.
Application January 25, 1954, Serial No. 405,976
10 Claims. (Cl. 219—38)

1. A water heater comprising a closed water tank having a convexedly curved bottom wall, an annular heating element unit including a shell of flattened tubular section having a concavedly curved inner face contactingly fitting said convexedly curved tank bottom wall, a combined holder and heat transfer member for said

heating element unit concavedly curved and contactingly fitting against the convexedly curved tank bottom wall and having an upwardly facing annular groove in which said heating element unit is disposed to support the heating element unit against the tank bottom wall, a dished combined clamping reflector and heat transfer member having a peripheral portion underlappingly engaging the

bottom wall of the groove in said holder, and a threaded stud depending centrally from the said tank bottom wall and disposed through a central opening in said clamping member, said stud being provided with a nut for clamping said bottom wall contacting parts thereto, said heating element unit being provided with downwardly projecting binding posts, said holder and clamping member being provided with openings through which said posts project.

---

2,772,345
DENTAL SPOT-WELDER
Burdett L. Gainesforth, Ogallala, Nebr.
Application April 16, 1954, Serial No. 423,798
4 Claims. (Cl. 219—86)

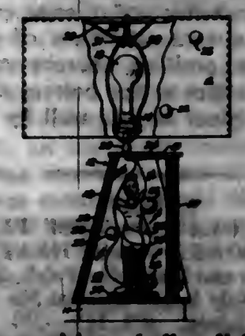
1. In a spot-welder having a casing and a welding transformer therewithin, an upper, stationary electrode on the casing; a platform having a lower electrode attached thereto and extending laterally therefrom; means pivotally attaching the platform to the casing on one side of the upper electrode for swinging movement of the lower electrode toward and away from a normal position contacting the upper electrode; a tap switch on said casing on the opposite side of the upper electrode; and conductor means coupling both electrodes and said switch with said transformer for energization of a welding circuit upon actuation of the switch when the platform is in said position.

---

2,772,346
HEAT BLASTING TOOL WITH FLUID JET
Theodore I. Lester, New York, and William B. Kriewall, Flushing, N. Y., assignors to All-State Welding Metals, Inc., New York, N. Y., a corporation of New York
Application November 9, 1953, Serial No. 391,842
13 Claims. (Cl. 219—121)

1. An electrically operated consumable blasting tool for boring holes in refractory materials comprising an elongated cylindrical member having a substantially parallel pair of spaced elongated electrically conductive members embedded in a covering composition of a substantially electrically non-conductive insulatory nature, said conductive members being formed from an arc consumable material, said covering material including a substantial portion of iron oxide producing ingredients and gas-forming ingredients in homogeneous mixed granular form, and means associated with said member for supplying and directing a stream of expansible liquid in parallel alignment with said conductive members, said means providing an egress for said liquid, adjacent one terminal end of said parallel pair of members, whereby said members can be energized in a series electric circuit to form a self-sustained electric arc therebetween to heat and expand the liquid directed through said means.

---

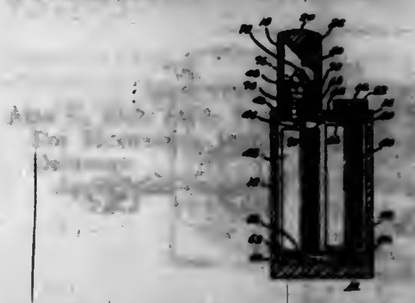


2,772,347
RAILING LAMP
Dwight I. Lamman, Des Moines, Iowa
Application December 6, 1954, Serial No. 473,141
7 Claims. (Cl. 240—2)

7. In a lamp post unit, a rectangular post having a back, two sides, and at least a portion of a front, an elongated spring lamp bracket in said post having its two ends bent forwardly normally at right angles to its length and with said bent ends each having a length greater than that of the distance between the inside back of said post and the under side of said front portion, whereby said spring lamp bracket is required to be yieldingly bowed between its two ends to permit said bent ends to rest between the inside back of said post and said front portion, a lamp socket on one of said forwardly bent ends, an incandescent lamp in said lamp socket adapted to be in communication with a source of electric current, and a front cover on said post having a window.

---

2,772,348
LAMP HAVING REVOLVABLE FIGURINE
Gerald Mess, San Francisco, Calif.
Application January 9, 1956, Serial No. 557,959
9 Claims. (Cl. 240—2)



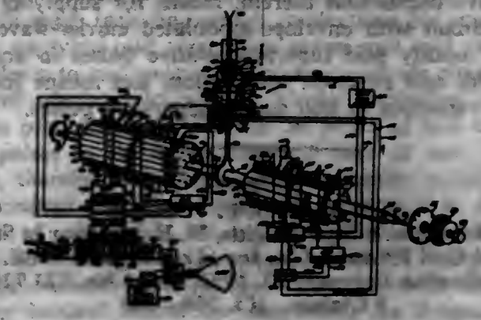
1. A lamp comprising a hollow light transmissive base, a pedestal having a light-reflecting surface mounted on the rear of said base, a turntable, a figurine mounted on said turntable in front of said pedestal, a collar vertically mounted in said turntable, a driven shaft extending vertically through and above said base and removably fitting said collar; said turatable and said figurine being removable as a unit from said shaft, means for driving said shaft to revolve said figurine before said pedestal, and illumination means within said base for illuminating said figurine directly through said light transmissive base and by reflection from the light-reflecting surface of said pedestal.

---

2,772,349
ILLUMINATING APPARATUS
William H. Chamberlin, Chicago, Ill.
Application May 11, 1953, Serial No. 354,250
2 Claims. (Cl. 240—10.65)

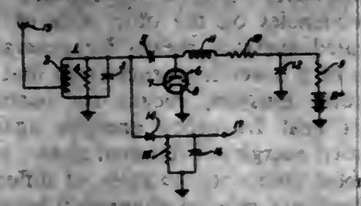
1. Illuminating apparatus comprising a case having at least one substantially planar outer surface, electric battery means secured within said case, an electric lamp having a light source therein energizable from said battery means, switch means mounted on said case for connecting said battery means and said light source, a permanent magnet mounted on said planar outer surface for supporting the apparatus juxtaposed against a body of magnetic material, a substantially cylindrical enclosure extending from said case substantially parallel to said planar outer surface, said lamp being mounted in and substantially surrounded by said cylindrical enclosure, lens means in spaced relationship to said light source to produce a light beam substantially parallel to the axis of said cylindrical enclosure, a substantially cylindrical housing rotatably mounted on said enclosure for rotation through substantially 360° and having a closed outer end and a transverse circular opening adjacent thereto, and reflecting means mounted within said housing at substantially 45° to the axis of said housing to direct the light beam outwardly through the aperture in said housing.

---



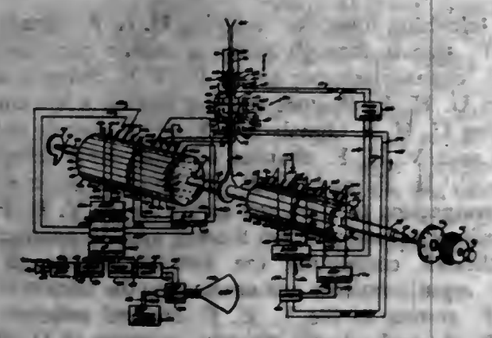
2,772,350
ACTIVE FREQUENCY-SELECTIVE FILTER NETWORK USING DOUBLE FREQUENCY CONVERSION
Ralph W. Dentzer, Portland, Oreg.
Application December 1, 1954, Serial No. 472,334
4 Claims. (Cl. 250—20)

4. A circuit for receiving energies of a wide frequency spectrum and operative for selecting a desired band therefrom, comprising means for generating first local energies of a frequency on one side of the desired band and of different relative phases, means for beating the received energies against local energies of different relative phases so as to produce beat frequency energies of different phases, means for effecting a relative phase shift between beat frequency energies of one phase relative to beat frequency energies of a different phase to place these energies in cancellable phase relation, and means for balancing these beat frequency energies against one another to balance out the beat frequency energies representing the frequencies on one side of that locally generated and to leave beat frequency energies representing the desired band and frequencies on the other side of that of the locally generated energies, means for generating second local energies of a lower frequency from that of the first locally generated energies, means for beating the uncancelled first beat frequency energies against second locally generated energies of different phases so as to provide second beat frequency energies of different phases, means for effecting a relative phase shift between second beat frequency energies of one phase relative to second beat frequency energies of another phase to place them in cancellable phase, and means for balancing these second beat frequency energies against one another to balance out energies above the frequency of that of the second generated local energies and leave only second beat frequency energies representing the desired band.



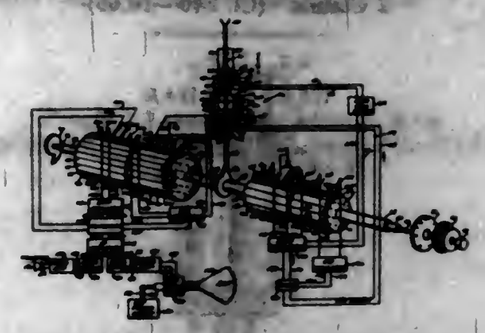
---

2,772,351
PLURAL BAND TELEVISION RECEIVER TUNER WITH CHANNEL INDICATOR KNOB
Stuart Machlin, Huntington, N. Y., assignor to Standard Coil Products Co., Inc., Los Angeles, Calif., a corporation of Illinois
Application March 14, 1952, Serial No. 276,573
8 Claims. (Cl. 250—20)



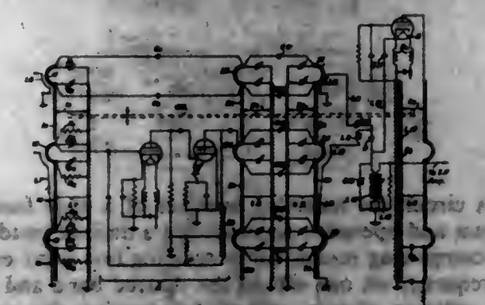
1. A television tuner for receiving U. H. F. signals and V. H. F. signals through antenna means comprising a U. H. F. channel selector and a V. H. F. channel selector; said U. H. F. channel selector having a system for converting U. H. F. signals into V. H. F. signals receivable by said V. H. F. channel selector; input terminals for the U. H. F. and V. H. F. channel selectors; a switch connecting the antenna means to the V. H. F. input terminals in one position thereof and, in another position thereof connecting the antenna means to the U. H. F. input terminals and connecting the output of the U. H. F. system to the V. H. F. channel selector; the U. H. F. channel selector selecting a group of U. H. F. signals; the V. H. F. channel selector, when the U. H. F. system is connected to the V. H. F. channel selector, selecting a specific signal from the group of converted signals selected by the U. H. F. channel selector; said channel selectors being axially aligned and mounted on concentric shafts; concentric manual control members connected to each shaft; each control member comprising a manually rotatable knob carrying indicia; the V. H. F. control member being mounted in front of and masking portions of the indicia of the U. H. F. control member; the U. H. F. shaft carrying a member for operating the switch to connect the antenna means to the V. H. F. input terminals at a predetermined angular position of said U. H. F. shaft; indicia means operable when said predetermined angular position of said U. H. F. shaft is reached to indicate that the television tuner is set for V. H. F. reception.

2,772,352
SUPERREGENERATIVE AMPLIFIER
Joseph C. Tellier, Penn Wynne, Pa., assignor to Philco Corporation, Philadelphia, Pa., a corporation of Pennsylvania
Application June 7, 1950, Serial No. 166,606
2 Claims. (Cl. 250—20)



1. A superregenerative amplifier, comprising, in combination: a relaxation oscillator including a gaseous discharge device having an anode element and a cathode element, said relaxation oscillator being operative to render said discharge device intermittently conductive during time-spaced intervals whereby said discharge device is caused to present a negative resistance between said anode and cathode elements during said intervals of conduction, and a tuned circuit connected effectively between said anode and cathode elements of said discharge device and having an equivalent parallel resistance which is greater than the absolute value of said negative resistance presented by said discharge device during at least portions of said intervals of conduction therein, thereby intermittently to overcome the damping of said tuned circuit and to produce pulses of superregenerative oscillations therein, means for supplying said tuned circuit with envelope-modulated carrier-wave signals to modify said superregenerative pulses in accordance with said envelope modulation, and means for detecting variations in said superregenerative pulses.

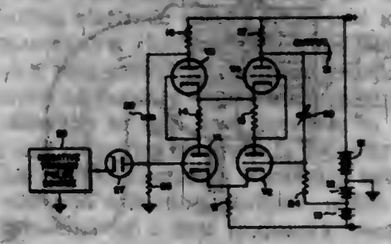
2,772,353
V. H. F.-U. H. F. TUNERS
Jay E. Browder, Roslyn Heights, N. Y., assignor to Standard Coil Products Co., Inc., Los Angeles, Calif.
Application February 27, 1952, Serial No. 273,720
9 Claims. (Cl. 250—20)



1. A television tuner for receiving ultra-high frequency channels and very high frequency channels comprising a pair of rotatable turrets, each turret having a plurality of panels; a plurality of circuit components associated with each turret and having stationary contacts; the panels of each turret each having additional circuit components and contacts engageable with the stationary contacts; one turret and the circuit components associated therewith being adapted to receive V. H. F. signals; the other turret and the circuit components associated therewith being adapted to receive U. H. F. signals, one of the turrets and its associated circuit components being adapted to convert signals received by it into signals receivable by the other of said turrets and its associated circuit components, said rotatable turrets being arranged along the same axis in tandem relation, a shaft member secured to each of said rotatable turrets for individual rotation and tuning thereof, the rearward shaft member projecting through the forward turret and through its associated front shaft member in concentric relationship and presenting substantially contiguous positions for their associated band tuning knobs.

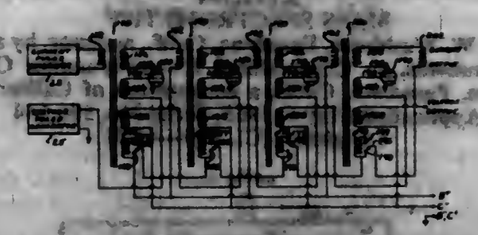
2,772,354
V. H. F.-U. H. F. TUNERS
Jay E. Browder, Roslyn Heights, N. Y., assignor to Standard Coil Products Co., Inc., Los Angeles, Calif., a corporation of Illinois
Original application February 27, 1952, Serial No. 273,720. Divided and this application March 17, 1953, Serial No. 345,573
5 Claims. (Cl. 250—20)

1. A television tuner for receiving ultra-high frequency signals and very high frequency signals comprising a pair of rotatable turrets, each turret having a plurality of panels; a plurality of circuit components associated with each turret and having stationary contacts; the panels of each turret having additional circuit components and contacts engageable with the stationary contacts the circuit components having stationary contacts being the predominantly frequency controlling element and the additional circuit components on the turret being comparatively high impedance elements to vary by small amounts the operating frequency when connected to the first circuit components; one turret and the circuit components associated therewith being adapted to receive V. H. F. signals; the other turret and the circuit components associated therewith being adapted to receive U. H. F. signals, one of the turrets and its associated circuit components being adapted to convert signals received by it into signals receivable by the other of said turrets and its associated circuit components.

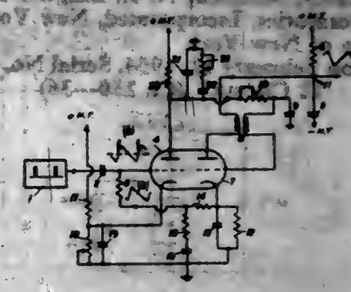


2,772,355
WIDE RANGE TUNER
Sid Deutsch and Herbert A. Flaim, Brooklyn, N. Y., assignors to Polytechnic Research & Development Co., Inc., Brooklyn, N. Y., a corporation of New York
Application July 5, 1951, Serial No. 235,117
15 Claims. (Cl. 250—20)

8. A tuner for short radio waves comprising a pair of electrically independent transmission lines arranged in alignment, with a small gap between adjacent ends of the conductors of said lines, individual means for applying received waves to each of said lines, a detector having an input terminal, individual connections from said lines to said detector terminal, a single short-circuiting slider movable throughout the extent of both of said lines for selectively rendering one or the other of said lines effective to energize said detector, an electron tube oscillator having a frequency determining element comprising a single quarter-wave shielded transmission line having a length equal substantially to the combined lengths of said pair of shielded lines, a short-circuiting slider for said quarter-wave transmission line movable throughout the same range as the short-circuiting slider for said pair of lines, operating means connecting said short-circuiting sliders for ganged operation, and a connection for supplying oscillations from said oscillator to said detector.

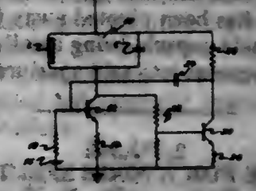


2,772,356
MULTIVIBRATOR CIRCUIT
Alan L. Rich, Hyde Park, Mass., assignor to Laboratory For Electronics, Inc., Boston, Mass., a corporation of Delaware
Application August 28, 1952, Serial No. 306,851
11 Claims. (Cl. 250—27)



1. A multivibrator circuit comprising first and second pairs of serially connected electron tubes energized in parallel from a potential source, means for rendering conductive both tubes in said first electron tube pair, means for initiating conduction in both electron tubes in said second electron tube pair, and means intercoupling said first and second tube pairs whereby conduction in said second tube pair substantially instantaneously terminates conduction in both tubes of said first tube pair.

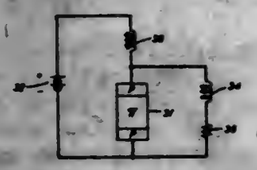
2,772,357
TRIGGERING CIRCUIT
An Wang, Cambridge, Mass.
Application June 6, 1952, Serial No. 292,215
28 Claims. (Cl. 250—27)



3. A scaler including a pulse transfer controlling device comprising a core of magnetic material in which the residual magnetic flux density is a large fraction of the saturation flux density, a first winding means on said core, current pulse means connected to said first winding means, amplifying means having an anode and a grid, an anode voltage source, a second winding means on said core connected to said grid, and signal pulse means connected to said second winding means opposing said current pulse means, said current pulse means and said signal pulse means being connected and arranged to provide substantially simultaneous pulses.

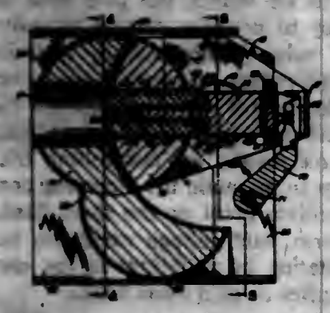
2,772,358
SCANNING CIRCUITS FOR CATHODE RAY TUBES
Arthur W. Keen, Coventry, England, assignor to Electric & Musical Industries Limited, Hayes, England, a British company
Application February 9, 1952, Serial No. 270,852
Claims priority, application Great Britain February 16, 1951
2 Claims. (Cl. 250—36)

1. A flywheel scanning circuit suitable for a cathode ray tube, comprising an oscillator including an oscillator valve having a control electrode and a cathode, and voltage responsive frequency control means connected to said control electrode for determining the natural frequency of said oscillator, a control valve having at least an anode, a control electrode and a cathode, means connected to the cathode of said oscillator valve for deriving a sawtooth waveform having a frequency determined by said oscillator, a source of controlling pulses of positive polarity, a control electrode-to-cathode circuit for said control valve including circuit connections for simultaneously applying said controlling pulses and said sawtooth waveform to said control electrode-to-cathode circuit, said control electrode-to-cathode circuit including biasing means predetermined to cause the peaks of said controlling pulses to lie within the grid base of said control valve, thereby to produce current intensity variations in said control valve in response to variations in the elevation of said pulses, an output load connected to the anode of said control valve, and means for applying the voltage variations across said output load to said frequency control means for controlling the frequency of said oscillator to maintain the incoming controlling pulses at an intermediate point on the short flanks of said sawtooth waveform, said voltage variations being an amplified representation of variations in the elevation of said controlling pulses on said short flanks.



2,772,359
SYNCHRONIZED OSCILLATOR
Victor J. Medlano, Los Angeles, Calif., assignor to Sperry Rand Corporation, a corporation of Delaware
Application May 26, 1955, Serial No. 511,218
8 Claims. (Cl. 250—36)

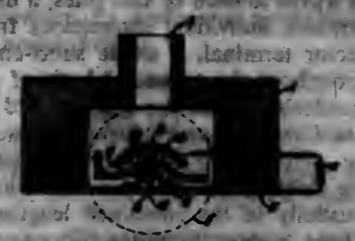
8. A gated oscillator controlled in response to a source of synchronizing pulses, comprising an inductive-capacitive tank circuit, means for driving said tank circuit at its resonant frequency to sustain oscillation therein, a transistor having base, emitter, and collector electrodes, the resistor and tank circuit being connected in series with the collector and emitter electrodes of the transistor across a potential source, and means for increasing the base current of the transistor for a half cycle interval



of the tank circuit, the base current being increased in response to a synchronizing pulse above the saturation level of the transistor, whereby the tank circuit is loaded to substantially the value of the resistor.

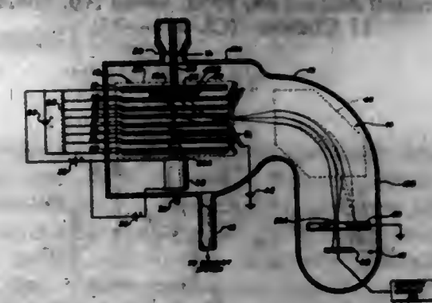
2,772,360
NEGATIVE RESISTANCE DEVICE
William Shockley, Madison, N. J., assignor to Bell Telephone Laboratories, Incorporated, New York, N. Y., a corporation of New York
Application February 11, 1954, Serial No. 409,667
12 Claims. (Cl. 250—36)

10. An oscillator comprising a semi-conductive diode including a plurality of contiguous zones of different predominances of charge carriers and an external circuit connected between the two terminals of said diode including biasing means for establishing in an intermediate zone of said plurality an electric field which puts said zone in the range of negative differential mobility for charge carriers traveling through said zone.



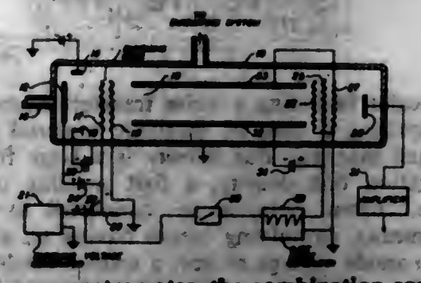
2,772,361
RADIOACTIVE SOURCE HOLDER
Everett N. Hastead, Columbus, Ohio, assignor, by mesne assignments, to the United States of America as represented by the Secretary of the Navy
Application December 21, 1953, Serial No. 399,446
10 Claims. (Cl. 250—106)

1. A radioactive source container comprising a capsule for holding a radioactive source; a radiation-absorbing shield, one surface of which is equidistant at every point from a predetermined axis; a mounting for said capsule within said shield and pivotable about said axis; and a radiation-absorbing member having an aperture therethrough so located that radiation can be emitted through the aperture when said capsule is registering with the aperture and the radiation is absorbed when the capsule mounting has been pivoted away from the vicinity of said aperture, said capsule being axially slidable in said mounting for movement into said aperture.



2,772,362
ION SOURCE FOR A MASS SPECTROMETER
Leonard A. Dietz, Pattersonville, N. Y., assignor to General Electric Company, a corporation of New York
Application April 26, 1955, Serial No. 504,027
4 Claims. (Cl. 250—41.9)

1. An ion source for a mass spectrometer tube comprising, an ionization chamber having a slit at one end through which ions may pass, a curved ion repeller plate disposed within said ionization chamber opposite the slit in the one end of said chamber and having a positive potential relative to said one end of said chamber for electrostatically focusing any ions formed within said chamber at a point in the region of said slit and a pair

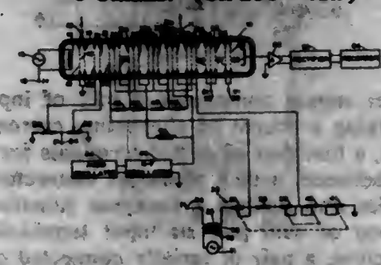


of guiding plates disposed on the sides of said slit for guiding ions through said slit.

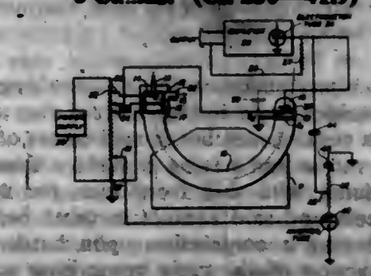
2,772,363
METHOD AND APPARATUS FOR IONIZATION OF SOLIDS
Charles F. Robinson, Pasadena, Calif., assignor, by mesne assignments, to Consolidated Electrodynamics Corporation, Pasadena, Calif., a corporation of California
Application March 21, 1952, Serial No. 277,772
4 Claims. (Cl. 250—41.9)

1. An ion source for ionizing a solid sample comprising an evacuatable envelope, means for supporting the solid sample within the envelope, a secondary ion source adapted to develop a beam of positive ions, means for impinging the beam of positive ions against the surface of the solid sample whereby ions are emitted therefrom, a series of parallel arranged grids disposed in the envelope adjacent the means for supporting the solid sample, a voltage source connected across the grids to form a uniform electrical field, magnet means disposed to develop a magnetic field normal to the electrical field whereby ions emitted from the sample pursue cycloidal trajectories from the point of origin with a consequence that a part thereof is expelled from the source between the grids.

2,772,364
MASS SPECTROMETRY
Harold W. Washburn, Pasadena, Calif., assignor, by mesne assignments, to Consolidated Electrodynamics Corporation, Pasadena, Calif., a corporation of California
Application May 6, 1953, Serial No. 506,644
8 Claims. (Cl. 250—41.9)

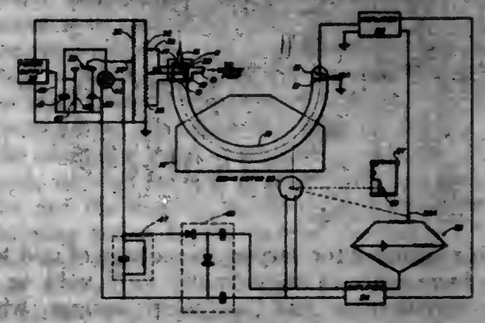


1. In a mass spectrometer, the combination comprising an evacuable envelope, means for developing ions within a restricted region of the envelope, an ion collecting electrode disposed in the envelope remote from the region of ion formation, propelling means for propelling ions from



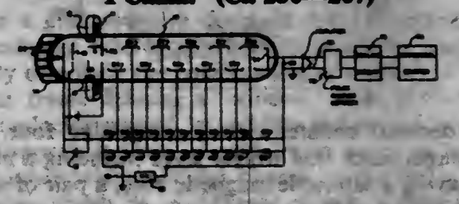
the region of ion formation toward the collector electrode whereby the ions separate into mass discriminated bunches, gating means disposed adjacent the collector electrode to alternately block and permit ion access to the collector, and means for producing in the region between the propelling and gating means a force operable to deflect ions from their line of travel between the source and the collector electrode.

2,772,365
MASS SPECTROMETER
Cecil B. Shelman, Fort Worth, Tex., assignor to Phillips Petroleum Company, a corporation of Delaware
Application December 20, 1954, Serial No. 476,521
8 Claims. (Cl. 250—41.9)



1. In a mass spectrometer comprising an ion source, an ion collecting electrode spaced from said ion source, an ion permeable first electrode positioned between said ion source and said collecting electrode, means to apply a first potential of polarity opposite the polarity of the ions being detected to said first electrode to accelerate ions toward said collecting electrode, a plurality of spaced ion permeable second electrodes positioned between said ion source and said collecting electrode, a first source of alternating potential of a first frequency, means applying said first source of alternating potential between adjacent pairs of said second electrodes, a third ion permeable electrode positioned between said second electrodes and said collecting electrode, and means to apply a second potential of the same polarity of the ions being detected to said third electrode; means to compensate said spectrometer for variations in said first potential consisting of a second source of alternating potential of a second frequency, and means to apply said second source of alternating potential to said first electrode.

2,772,366
MASS SPECTROMETRY
Clifford E. Berry, Altadena, Calif., assignor, by mesne assignments, to Consolidated Electrodynamics Corporation, Pasadena, Calif., a corporation of California
Application September 14, 1953, Serial No. 380,052
6 Claims. (Cl. 250—41.9)

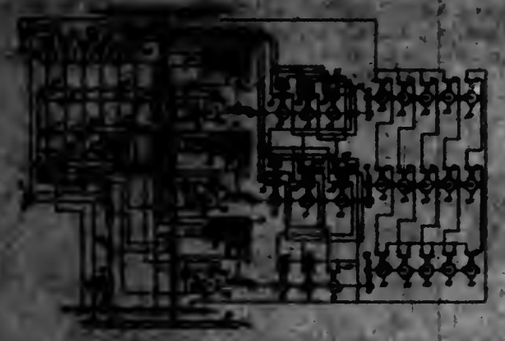


1. In a mass spectrometer including an accelerating voltage circuit, an ion collector, and an electrode disposed adjacent the ion collector and electrically connected to the accelerating voltage circuit, the combination comprising a capacitor connected to the ion collector, a phase inverter tube having an anode cathode and grid, means connecting the accelerating voltage circuit to the grid of the tube and means connecting the anode of the tube to the capacitor.

2,772,367
RECORDING SYSTEM
Charles F. Robinson, Pasadena, Norton W. Bell, Arcadia, Salvatore Vito Piccirillo, West Covina, and George D. Perkins, Duarte, Calif., assignors, by mesne assignments, to Consolidated Electrodynamics Corporation, Pasadena, Calif., a corporation of California
Application September 17, 1953, Serial No. 380,784
12 Claims. (Cl. 250—41.9)

1. In combination with a self balancing recorder, apparatus for varying the rate of presentation of information to the recorder comprising first means operable at a variable rate to develop the information, and second means connected between the recorder and the first means to continuously control the operation of the first means to vary the rate of presentation as an inverse function of the magnitude of recorder unbalance.

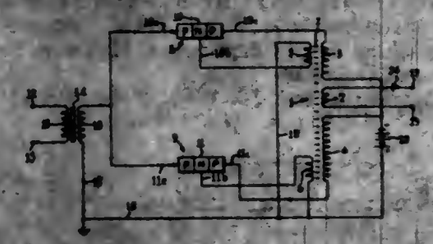
2,772,368
HIGH TEMPERATURE SCINTILLOMETER
Serge A. Scherbatskoy, Tulsa, Okla., assignor to Perforating Guns Atlas Corporation, Houston, Tex., a corporation of Delaware
Application August 10, 1951, Serial No. 241,176
1 Claim. (Cl. 250—207)



In a photoelectric detector for translating incoming photons into electrical impulse, a photoelectric element adapted to emit electrons of relatively high energy when exposed to said incoming photons, said element also emitting thermal electrons of relatively low energy when subjected to high ambient temperatures, a control grid positioned adjacent said element and operated at a positive potential with respect thereto for accelerating both high and low energy electrons emitted by said element, electron deflecting field means positioned beyond said control grid for deflecting electrons accelerated by said control grid in inverse relation to their energies, a secondary electron emitter positioned beyond said field means, and barrier means positioned between said field means and said secondary electron emitter for preventing those electrons which are deflected more than a predetermined amount from striking said emitter, whereby said detector is rendered substantially insensitive to changes in ambient temperature.

2,772,369
PARALLEL OPERATION OF TAP CHANGING TRANSFORMERS
Harold E. Pinney, Pittsfield, Mass., assignor to General Electric Company, a corporation of New York
Application October 28, 1955, Serial No. 546,070
20 Claims. (Cl. 307—58)

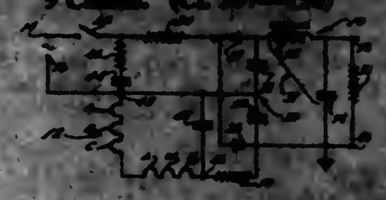
1. In an electric power system, a plurality of voltage regulating means connected in parallel between an alter-



using power source and a load circuit, separate control means for each of said voltage regulating means for varying the load voltages of their respective voltage regulating means in increments of V volts, said control

means being arranged for varying the voltage of said load circuit in increments of substantially $V/N$ volts in response to variations in said load circuit voltage, where N is the number of parallel connected voltage regulating means.

---



2,772,370
BINARY TRIGGER AND COUNTER CIRCUITS EMPLOYING MAGNETIC MEMORY DEVICES
George D. Brown, Wappinger Falls, and Joseph C. Logue, Kingston, N. Y., assignors to International Business Machines Corporation, New York, N. Y., a corporation of New York
Application December 31, 1953, Serial No. 401,674
16 Claims. (Cl. 307—88)

7. A decimal counter circuit comprising four binary trigger stages, each said trigger stage including a memory device having a saturable magnetic core, a pair of saturating windings on said core, a pair of saturating means, each including one of said windings, both saturating means being operable in response to input signals of predetermined polarity to vary the magnetic flux in the core in respectively opposite senses and to the point of saturation, each of said saturating means including limiting means effective to prevent operation of its associated saturating means when the core is saturated in its direction, means to deliver input signals of said predetermined polarity simultaneously to both the saturating means of the first stage, so that successive input signals are effective to saturate the core alternately in opposite directions; first and second coupling means including output windings on the cores of said first and second stages for transmitting output signals due to variation of the core flux of each of said first and second stages to both the saturating means of the succeeding stage; third coupling means including an output winding on the core of the third stage for transmitting output signals due to variation of the core flux of said third stage to one only of the saturating means of the fourth stage, fourth coupling means including a second output winding on the core of the first stage for transmitting output signals due to variation of the core flux of the first stage to the other of the saturating means of the fourth stage, blocking means including an output winding on the core of the fourth stage for transmitting output signals due to variation of the core flux of the fourth stage by said other saturating means to both the saturating means of the second stage in a sense to block operation thereof, and signal output means including a second output winding on the core of the fourth stage for transmitting output signals due to variation of the core flux of said fourth stage by said other saturating means.

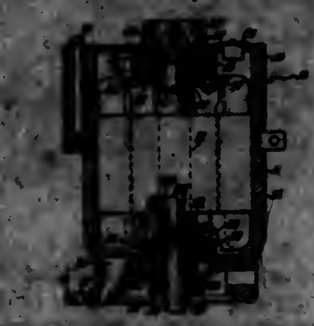
---

2,772,371
POWER SUPPLY
Bethel E. Deaton, Haddonfield, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application January 3, 1955, Serial No. 480,977
9 Claims. (Cl. 307—130)

9. A power supply comprising a pair of input terminals for applying a source of alternating current voltage therebetween, a first pair of output terminals for applying a load therebetween, a pair of diodes connected to each other in series and having a common junction, means connecting one of said pair of input terminals to said common junction, a pair of serially connected capacitors having a common junction and connected in series with said diodes, means connecting the other of said pair of input terminals to said last-mentioned junction, filter means connected between said pair of serially connected diodes, said first pair of output terminals being connected in series with said serially connected diodes through said filter means, a second pair of output terminals for applying a filament string therebetween, means including a first capacitor to connect said one of said pair of input terminals to one of said second pair of output terminals, means connecting the other of said second pair of output terminals to said serially connected capacitors, and means including a second capacitor connecting said one of said second pair of output terminals to one of said first pair of output terminals.

---

2,772,372
COMPOSITE DISTRIBUTOR ROTOR
Fred S. Slick, Rockford, Ill., assignor to J. I. Case Company, Racine, Wis., a corporation of Wisconsin
Application February 2, 1955, Serial No. 485,731
11 Claims. (Cl. 310—70)



11. A composite distributor rotor comprising a body portion of a molded resin having a front face provided with a recess, a contact member in said recess of an area less than said recess and having a surface thereof substantially co-planar with said front face, the space between said recess and said contact member being filled with a resin having a contraction upon hardening less than the contraction of the resin comprising said body portion.

---

2,772,373
MOTOR THRUST LOAD BALANCING MEANS
John R. Howe, Novelty, Ohio, assignor to Borg-Warner Corporation, Chicago, Ill., a corporation of Illinois
Application April 18, 1955, Serial No. 502,069
7 Claims. (Cl. 310—90)

1. In a substantially vertically mounted motor assembly including a housing defining a motor chamber, a motor mounted in said chamber, a motor shaft having a shoulder formed thereon adjacent the bottom of said housing, said shaft extending from said housing at the top and bottom thereof; an upper annular carbon thrust bearing having annular groove defining means in the top and bottom surfaces thereof, surrounding said shaft fixedly retained in said housing adjacent the top thereof; annular thrust washers contacting the top and bottom surfaces of said upper thrust bearing of a diameter to overhang said groove defining means so as to prevent the scoring of said surfaces by the edges of said washers; a lower annular carbon thrust bearing surrounding said

shaft fixedly retained in said housing adjacent the bottom thereof; an annular thrust plate surrounding said shaft and received in an annular opening in said housing adjacent said lower thrust bearing; and a coiled compression spring disposed around said shaft between said shaft shoulder and said thrust plate effective to react against said shoulder and thereby to said upper thrust bearing, and against said thrust plate and thereby to said lower thrust bearing to divide the thrust of the rotor of said motor between said thrust bearings, so that each of said thrust bearings is subjected to substantially one-half the thrust of said motor.

---

2,772,374
DIFFERENTIAL SYNCHRO
Paul B. Aller, Philadelphia, and Stuart E. Hotchkiss, Southampton, Pa.
Application June 7, 1954, Serial No. 435,160
3 Claims. (Cl. 310—115)
(Granted under Title 35, U. S. Code (1952), sec. 266)

1. A compact fully enclosed differential synchro mechanism comprising a hollow generally cylindrical fixed non-rotatable case member having opposed end portions each having a centrally disposed recess therein at least one of which forms an opening through the case member, first and second bearing means mounted in the respective recesses of the respective end portions of said case member, a hollow generally cylindrical stator supporting frame closely interfitted within said case member and having opposed stub shafts projecting outwardly from its opposite ends at least one of which is hollow and both of which project into rotatable engagement with the first and second bearing means to rotatably support said stator supporting frame within the case member, a third bearing means mounted within the hollow stub shaft, a third recess in the stator supporting frame opposite to and in alignment with said hollow stub shaft, a fourth bearing means mounted in said third recess, an elongated rotor shaft rotatably supported in said third and fourth bearing means, a stator winding fixedly secured to the inner surface of said stator supporting frame, a rotor winding secured to said rotor shaft in alignment with said stator winding, a plurality of electrical connections fixedly secured to one said portion of the case member and projecting within the case member into engagement with a series of concentric circular sliding contacts mounted for rotation with the stator supporting frame, electrical conductors interconnecting a first plurality of said sliding contacts and the stator winding, a pair of slip rings mounted upon said rotor shaft, electrical conductors interconnecting said slip rings and a second plurality of the sliding contacts, said stator supporting frame and said rotor shaft being so disposed that one of the stub shafts projecting from the stator supporting frame and one end of the elongated rotor shaft project through at least one opening through the case member closed by the respective shafts and the bearing means therefor, a stator winding positioning means fixedly secured to the external portion of the stub shaft, and a rotor winding positioning means fixedly secured to the external portion of the rotor shaft, both of said positioning means having overall dimensions substantially less than the circumferential outer diameter of said case member.

---

2,772,375
ELECTRODE STRUCTURE FOR IMAGE-REPRODUCING CATHODE-RAY TUBES
Joseph E. Byrne, Lafayette, Calif., assignor to Chromatic Television Laboratories, Inc., New York, N. Y., a corporation of California
Application January 14, 1954, Serial No. 403,987
6 Claims. (Cl. 313—78)

1. In a grid structure designed for incorporation into a cathode-ray tube adapted to reconstitute images in a plurality of colors, the combination of a substantially rectangular frame defining a "window" area, a first continuous conductor wound in coil-like fashion around oppositely-disposed sections of said frame so as to form two sets of substantially parallel strands across the said "window" area which lie in different planes, a layer of insulating material overlying those portions of said first conductor which encircle the two said oppositely-disposed frame sections, a second continuous conductor wound in coil-like fashion around said frame so as to overlie said insulating layer, thus forming two further sets of substantially parallel strands across said "window" area which lie in planes different from those of the first-mentioned sets and means for bringing the strands of all the said sets into substantially coplanar relationship across the "window" area of said frame.

---

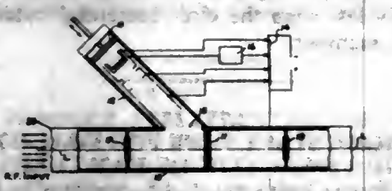
2,772,376
GRID STRUCTURE FOR CATHODE-RAY TUBES DESIGNED FOR POLYCHROME IMAGE REPRODUCTION
Leslie J. Cook, Lafayette, and Lawrence T. Quaglia, San Francisco, Calif., assignors to Chromatic Television Laboratories, Inc., New York, N. Y., a corporation of California
Application January 14, 1954, Serial No. 404,038
11 Claims. (Cl. 313—78)

1. In a grid structure designed for incorporation into a cathode-ray tube adapted to reconstitute images in a

plurality of colors, the combination of a frame having a window area, a continuous conductor wound in coil-like fashion around said frame so as to form across said window area two sets of substantially parallel strands respectively lying in separate parallel planes and a bar of rigid material positioned substantially adjacent to the conductor support frame to compress one of the sets of parallel strands into coplanar relationship with the other.

---

2,772,377



**DEVICE FOR ELECTRONICALLY CONTROLLING THE PROPAGATION OF RADIO FREQUENCY POWER**

Benjamin Kazan, Princeton, N. J., assignor to the United States of America as represented by the Secretary of the Army

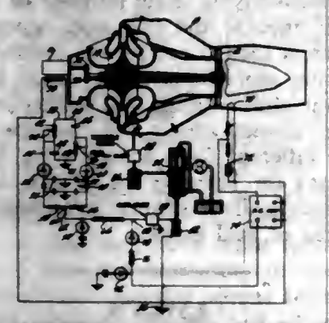
Application August 29, 1951, Serial No. 244,248

5 Claims. (Cl. 315—4)

(Granted under Title 35, U. S. Code (1952), sec. 266)

1. A radio frequency component comprising a hollow pipe wave guide section, a dielectric element in said section, means for introducing electromagnetic waves into said section with the electric field parallel to a substantial dimension of said dielectric element, and means bombarding said dielectric element with a beam of high voltage electrons for varying the conductivity of said dielectric element to variably attenuate said electromagnetic waves.

---



2,772,378

**SPEED CONTROL CIRCUITS**

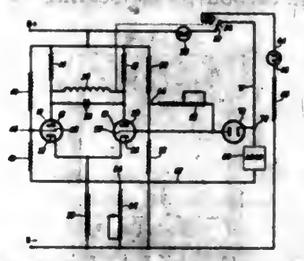
Thomas P. Farkas, Bloomfield, Conn., assignor to United Aircraft Corporation, East Hartford, Conn., a corporation of Delaware

Application December 11, 1951, Serial No. 261,020

6 Claims. (Cl. 317—5)

1. In combination with an engine driven alternating current generator having a grounded connection, a pair of electric circuits having one side grounded and the other side directly connected to said generator, one of said circuits having two separate impedances one of which has a reactance variable with the frequency of the generator, frequency variations causing the voltage drop across said reactance to vary with respect to the voltage drop across a selected portion of the other of said pair of circuits, a rectifier and an impedance in series and shunted across said reactance and a rectifier and an impedance in series and shunted across said selected portion, said last mentioned impedances being connected together at one end, a connection having a common line forming a part of a grounded circuit through both of said last mentioned impedances providing a D. C. voltage with respect to ground proportional to the algebraic sum of the voltages across said last mentioned impedances, and means actuated by said D. C. voltage for controlling the speed of said engine and the frequency of said alternating current.

---



2,772,379

**AUTOMATICALLY RESETTABLE CIRCUIT BREAKER SYSTEM**

Arthur J. Schultz, Emporium, Pa., assignor to Sylvania Electric Products Inc., a corporation of Massachusetts

Application July 9, 1953, Serial No. 366,945

3 Claims. (Cl. 317—23)

1. An automatically resettable overload circuit breaker arrangement comprising a Wheatstone bridge connected across a source of potential, two arms of the bridge being triodes, a common biasing resistor in the cathode circuits of the triodes, a magnetic coil across the arms for sensing bridge unbalance, a circuit breaker connected to a source of potential and operated by said coil, a series arrangement of a pair of resistors and a potentiometer, all in parallel arrangement with respect to the bridge, a connection between the grid of one triode and a point between the resistors of the pair, a second series arrangement of a pair of resistors in parallel with the bridge, a second potentiometer connecting the grid of the other of said triodes with a point between the resistors of said second series arrangement, a load connected between the circuit breaker and a point between the juncture of the first potentiometer and resistor of the first pair, and a diode with its anode connected to the grid of the second triode and its cathode to a point between the circuit breaker and load.

---

2,772,380

**TUBULAR ELECTRONIC UNIT**

Richard G. Andrew, Van Nuys, Calif.

Application April 26, 1954, Serial No. 425,424

5 Claims. (Cl. 317—101)

1. An electronic modular unit comprising a thermionic tube socket, having a cylindrical body and a flange constituting an integral part of said body, a plurality of orifices in said body, a corresponding plurality of socket terminals in said body for receiving a corresponding plurality of prongs of said thermionic tube, one end of said terminals projecting beyond said cylindrical body and being bent first outwardly and then inwardly to act as sliding, elecarical spring contact elements, a hollow, tubular insulation member having upper and lower edges and inner and outer surfaces joining said edges, first and second sets of printed conductors on said member, the number of said conductors in each set being equal to the number of said socket terminals, both sets of conductors extending over portions of said inner and outer surfaces

and the respective edges of said member, the conductors of the first set being spaced from the conductors of the second set in the direction of the longitudinal axis of said unit, an insulation plug partially fitting into said member and engaging the lower edge of said insulation member, said insulation plug having a corresponding plurality of metallic prongs circumferentially spaced in the same manner as the prongs of said thermionic tube, said prongs having metallic spring contact ears making pressure contacts with the inner portions of the respective printed conductors of the second set, said tube socket also partially fitting into said hollow member and engaging with its flange the upper edge of said hollow member, and the spring portions of said socket terminals making pressure contacts with the inner portions of the respective printed conductors of the first set, and fused metallic bonds between said tube socket, hollow member and said plug formed by said sets of printed conductors, for integrating said socket, member and plug into a unitary structure.

2,772,381

**MAGNETIC LID LIFTER FOR CAN OPENERS**

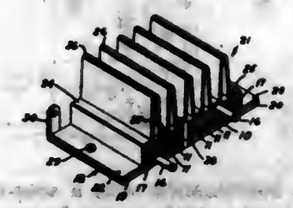
Ira P. Rhodes, St. Louis, Mo., assignor to Swing-A-Way Manufacturing Company, St. Louis, Mo., a corporation of Missouri

Application June 25, 1951, Serial No. 233,328

1 Claim. (Cl. 317—159)

A magnetic lid lifter for a can opener, said lid lifter comprising a magnet assembly and a non-magnetic support therefor, said magnet assembly including identical opposed magnetic pole plates of symmetrical form disposed in parallel, a plurality of bar magnets interposed between said plates and in abutment therewith, said magnets being disposed in symmetrical parallel arrangement, the north pole of each of said magnets extending in the same direction, non-magnetic securing means disposed in symmetrical arrangement with the magnets retaining the pole plates in compressive abutment therewith, and means fastened to said non-magnetic securing means for suspending said magnet assembly from said non-magnetic support.

---



2,772,382

**RECTIFIER ASSEMBLY WITH AIR COOLING FINS**

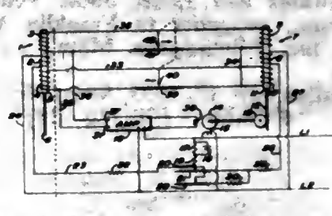
Charles A. Escoffery, Los Angeles, Calif., assignor to International Rectifier Corporation, Los Angeles, Calif., a corporation of California

Application May 31, 1955, Serial No. 511,880

3 Claims. (Cl. 317—234)

1. A dry plate rectifier comprising a rectifier stack of flat rectifier plates in conductive connection, a pair of terminal lugs, one terminal lug being on each side of said rectifier stack in conductive contact therewith, a wrapper of insulating material around the stack and lugs, a binder for said wrapped stack and lugs comprising a member on each side of said stack of lugs, said members being bound together to enclose said stack and lugs, at least one of said members being corrugated so as to form fins which radiate heat from the rectifier stack, and means for fastening said members together so as to bind and compress the rectifier stack.

---



2,772,383

**TEMPERATURE COMPENSATED SERVO COILS**

Robert O. Bradley, Clarence S. Simonds, and Charles Harold Jacobs, Toledo, Ohio, assignors to Toledo Scale Company, Toledo, Ohio, a corporation of New Jersey

Application December 30, 1952, Serial No. 328,619

2 Claims. (Cl. 318—28)

1. In an electrical data transmitting system, in combination, a pair of differential transformers each having a primary and pair of secondary windings, a source of alternating current power, a circuit for energizing said transformers comprising a first resistor in series with a pair of branch circuits each including a resistor and one of said primary windings, said resistors being adjusted according to the temperature coefficients of said transformers, said secondary windings being connected in series circuit with each winding connected in voltage opposition to the other winding of the same transformer and to the corresponding winding of the other transformer, a movable core for each transformer, resistors connected in parallel with each of the secondary windings, and means for simultaneously increasing the resistance of the resistors connected in parallel with two of the windings while decreasing the resistance of the remaining resistors, whereby the net voltage of said series circuit may be maintained substantially at zero as said cores are moved proportionate distances from their midpositions.

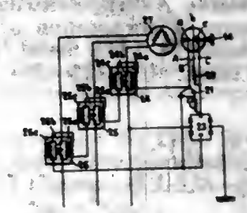
2,772,384



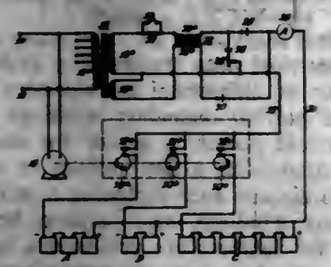
**SPEED CONTROL FOR A. C. MOTORS**

Josef Unterreiner, Zurich, Switzerland, assignor to Alois Huwyler, Zurich, Switzerland

Application December 28, 1950, Serial No. 203,177

Claims priority, application Switzerland November 14, 1950

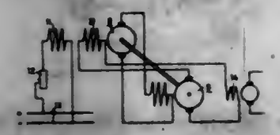
4 Claims. (Cl. 318—229)



1. Means for infinitely variable speed adjustment of a three-phase motor having a drive shaft; comprising, in combination, an electrical contact device having contact elements engageable with one another, a displaceable member located on one side of said contact device and responsive to variations in the speed of said shaft, a manually adjustable regulating member located on the opposite side of said contact device, said displaceable member and said regulating member being abuttable against said contact device and controlling the spacing of said contact elements for opening and closing the latter, a main three-phase power supply circuit for said motor, saturable reactor means including a plurality of load windings connected in each of the respective phases of said three-phase circuit and saturating windings for controlling the saturation of said reactor means and thereby controlling the

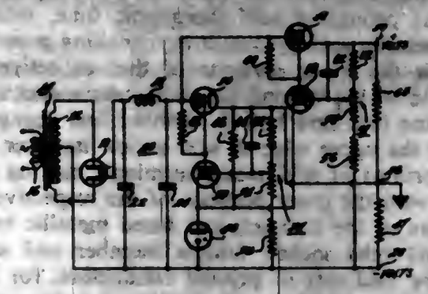
inductive reactance of said load windings, a source of control voltage, and means connecting said contact elements in series with said saturating windings across said source of control voltage, whereby said contact elements control the saturation of said reactor means and thus the speed of the motor.

---



2,772,385
BATTERY CHARGER FOR A PLURALITY OF SETS OF SERIES CONNECTED BATTERIES
Kenneth Dawkins and Elmer Jessie Peterson, Minneapolis, Minn., assignors to Franklin Manufacturing Company, Inc., Minneapolis, Minn., a corporation of Minnesota
Application July 17, 1953, Serial No. 368,642
6 Claims. (Cl. 320—18)

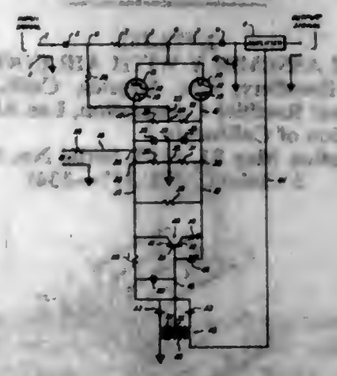
6. A constant current charging circuit for various numbers of series connected batteries comprising in combination: a source of alternating voltage; a reactor having a magnetic core and a winding; a rectifier; means defining output terminals; means connecting the source, reactor and rectifier in series relation to said output terminals; and a capacitor connected in shunting relation to the rectifier, the magnetic characteristics of the reactor being such that current flow therethrough while the rectifier is non-conducting conditions the core to cause a voltage in the winding during the subsequent conducting period of the rectifier of direction and amount to tend to maintain a constant average current flow through the rectifier.



---

2,772,386
DYNAMOELECTRIC AMPLIFYING MACHINES FOR CONTROLLING AND REGULATING PURPOSES
Franz Nechleba, Nuremberg, Germany, assignor to Siemens-Schuckertwerke Aktiengesellschaft, Berlin-Siemensstadt, Germany, a corporation of Germany
Application October 14, 1953, Serial No. 385,995
6 Claims. (Cl. 322—59)

1. A dynamoelectric amplifying system comprising a first direct-current generator having a separately excited field circuit and a first internal armature circuit, a first external circuit connected with said armature circuit, a second direct-current generator having a field winding forming part of said first external circuit and having a second internal armature circuit, and a second external circuit connected with said second armature circuit and including a load of ohmic resistance, said first armature circuit having an ohmic resistance substantially equal to the resistance of said first external circuit, and said second armature circuit having an ohmic resistance substantially equal to the resistance of said second external circuit.

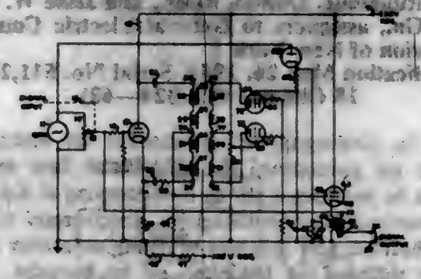


2,772,387
POWER SUPPLY WITH REGULATED POSITIVE AND NEGATIVE OUTPUT VOLTAGES
Anthony Lignori, Hackensack, N. J., assignor to Radio Corporation of America, a corporation of Delaware
Application October 29, 1953, Serial No. 389,117
4 Claims. (Cl. 323—22)

1. In a power supply of the type wherein a source of variable voltage is regulated by a first variable impedance device connected in series with said source and a first voltage divider, and having a first means comprising a first amplifier having a cathode for controlling the impedance of said device in accordance with changes in voltage drop across said first voltage divider; the combination therewith of a second voltage divider, a second variable impedance device connected in series with said source and said second voltage divider, a second means comprising a second amplifier having a cathode for controlling the impedance of said second device in accordance with changes in voltage drop across said second voltage divider, said first and second voltage dividers having a common junction, said cathodes being connected to each other, and means common to said first and second amplifiers connected between said common junction and said cathodes to maintain the voltage at said cathodes substantially constant with respect to said common junction.

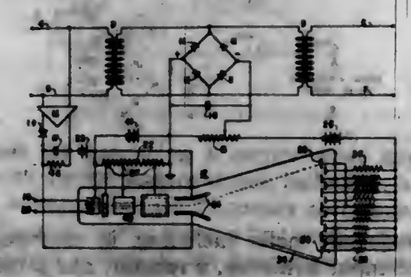
---

2,772,388
AUTOMATIC VOLUME CONTROL
Louis W. Erath, Paul E. Madsley, and Paul W. Geery, Houston, Tex., assignors, by mesne assignments, to Southwestern Industrial Electronics Company, Houston, Tex., a corporation of Delaware
Application October 18, 1954, Serial No. 463,024
24 Claims. (Cl. 323—24)



1. For use in combination with a source of an alternating current signal, which source has appreciable impedance and has a first output terminal which may be characterized as ground and a second output terminal, the combination of a first diode with a first anode and a first cathode; a second diode with a second anode and a second cathode; said first anode and said second cathode being adapted for connection to said second terminal; two resistors connected in series between said first cathode and said second anode, the common terminal between said two resistors being also adapted for connection to ground; a source of error voltage; means for applying said error voltage to control the relative potential difference between said first cathode and said second anode.

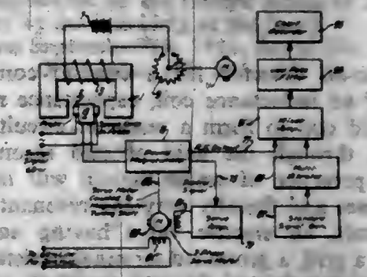
---



2,772,389
ELECTRICAL CONTROL SYSTEM
John W. Gray, Pleasantville, N. Y., assignor to General Precision Laboratory Incorporated, a corporation of New York
Application March 1, 1954, Serial No. 413,201
4 Claims. (Cl. 323—45)

1. In an electrical control system, a source of alternating current voltage to be controlled, a source of direct current voltage to serve as a reference voltage, two saturable reactors each having an alternating current winding and a direct current winding, means connecting said two alternating current windings in series at a common terminal, means for applying an alternating current voltage derived directly from said alternating current source and including all the characteristics of the voltage of said alternating current source to said alternating current windings in series, means for applying direct currents to said direct current windings, the relative values of said currents representing the deviation of the voltage of said alternating current source from a preselected potential to thereby vary the respective reactances of the corresponding alternating current windings in amplitude and phase sense to produce an alternating current correction potential at said terminal, and means for adding said correction potential to said alternating current potential in such phase as to oppose any variations of said alternating current potential from said preselected value.

---



2,772,390
VOLUME LIMITER DEVICE
Albert E. Woodruff, Chicago, Ill., assignor to Automatic Electric Laboratories, Inc., Chicago, Ill., a corporation of Delaware
Application March 27, 1953, Serial No. 345,067
6 Claims. (Cl. 323—66)

1. A voltage regulating device comprising a circuit including a load resistor, a source of current for causing a voltage drop across said load resistor, means for varying said voltage drop comprising a plurality of resistance elements having different resistance values, one terminus of each of said resistance elements connected to said load resistor, and means for selectively including any one of said plurality of resistance elements with said load resistor in said circuit, said last-mentioned means comprising a space discharge device having means for producing a stream of electrons and having a plurality of single insulated target plates in the sweep path of said electron stream, each of said plates connected to the other terminus of each of said resistance elements, respectively, said stream of electrons completing said circuit through any one of said resistance elements, and deflecting means for deflecting said electron stream from one of said target plates to another to thereby regulate said voltage drop across said load resistor in accordance only with said individual resistance values.

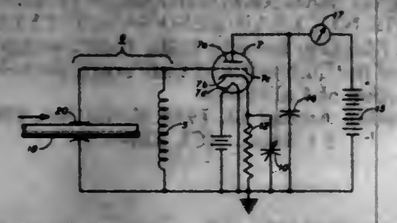
---

2,772,391
RECORDING MAGNETOMETRIC APPARATUS OF THE NUCLEAR-RESONANCE TYPE
Richard C. Mackey, Beverly Hills, Calif., assignor to The Regents of the University of California, Berkeley, Calif., a corporation of California
Application August 18, 1954, Serial No. 450,648
5 Claims. (Cl. 324—.5)

1. Registering magnetometric apparatus for giving a continuous train of indications of the strength of a varying magnetic field which comprises the combination, with a nuclear-resonance magnetometer operative to vary the value of an electric current as the magnetic field strength to which a sample is subjected is swept, through the value causing resonance in the sample to the frequency developed by an oscillator, by a cyclically varying magnetic field superposed on the field to be measured, of a servomotor mechanically connected to vary the tuning of said oscillator and having one phase winding supplied with a reference current of the frequency of said cyclically varying field, and a second phase winding supplied by the varied current from said magnetometer, whereby said oscillator is automatically tuned to the nuclear resonance frequency of said sample in the field to be measured, and frequency-responsive means for registering the frequency to which said oscillator is tuned.

---

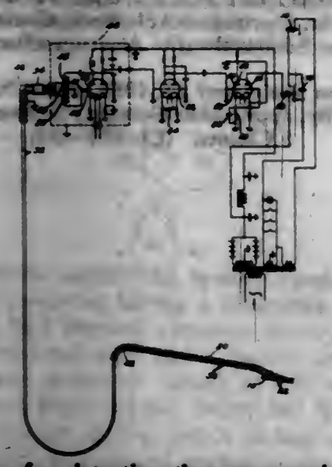
2,772,392
MAGNET POLE INDICATORS
Heinrich Mohr, Dortmund-Aplerbeck, Germany, assignor to Deutsche Edelstahlwerke Aktiengesellschaft, Krefeld, Germany
Application September 21, 1953, Serial No. 381,373
Claims priority, application Germany September 23, 1952
5 Claims. (Cl. 324—34)



1. A magnetic polarity indicator comprising a non-magnetic housing, a diametrically magnetised disc made of an oxidic permanent magnet material of high coercivity rotatably mounted in said housing, a window in said housing, and an arrow head pointer extension of said housing, the position of said window in relation to the

disc being determined so that one of two polarity markings on the disc appear in said window when the poles of the disc align with the pointer.

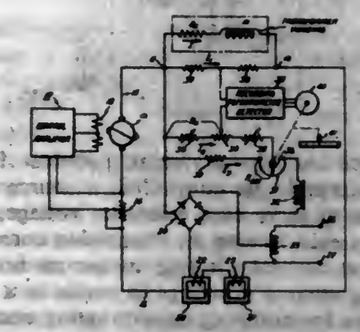
---



2,772,393
**WATER-IN-OIL DETECTOR**
Vincent C. Davis, Oakland, Calif., assignor to California Research Corporation, San Francisco, Calif., a corporation of Delaware
Application December 23, 1952, Serial No. 327,553
1 Claim. (Cl. 324—40)

A water-in-oil detector for a conduit conveying oil, consisting of an inductance coil, capacitance means connected to said coil to form a resonant circuit, said conduit passing through the field of said resonant circuit so that the presence of water therein will increase the electrical losses and thereby vary the resonant properties of said circuit, an electric valve having an anode, a cathode and a grid, a grounded terminal, resistance means connecting said cathode and said terminal, a source of direct current for said anode, a variable capacitor shunting said resistance means, means connecting said resonant circuit between said grid and said terminal to vary the anode current of said valve in accordance with changes in said resonant circuit, and a direct current indicator in series with said anode, said current source and said terminal so constructed and arranged that oscillations in said resonant circuit and the magnitude of said anode current are at a maximum when oil is present in said conduit, and decrease sharply when water is present in said oil.

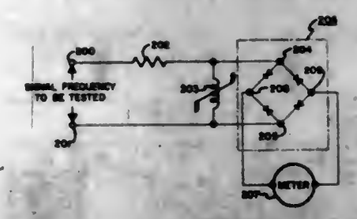
---



2,772,394
**DEVICES FOR FINDING PROTRUDING METAL OBJECTS IN SHOES**
Robert W. Bradley, Marblehead, Mass., assignor to United Shoe Machinery Corporation, Flemington, N. J., a corporation of New Jersey
Application December 28, 1951, Serial No. 263,791
10 Claims. (Cl. 324—61)

1. Apparatus for detecting the presence in a shoe of metal objects protruding from the shoe materials into the foot cavity comprising a probe having a handle and two similar superposed conductive contact members supported by the handle by which said contact members may be moved over the bottom surface of the shoe cavity, an indicating device, and two electrically balanced leads coupling the contact members to said indicating device in opposed relation, said indicating device being constructed and arranged to indicate engagement between a contact member and a metal object in response to electrical contact between said object and one only of said contact members.

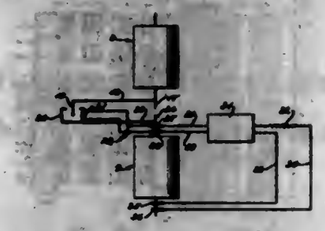
---



2,772,395
**METHOD AND APPARATUS FOR THE MEASUREMENT OF LOW RESISTANCE**
Lewis R. Ruxaldus, Dalton, Mass., and Jesse W. Burnett, Rome, Ga., assignors to General Electric Company, a corporation of New York
Application May 26, 1955, Serial No. 511,296
18 Claims. (Cl. 324—62)

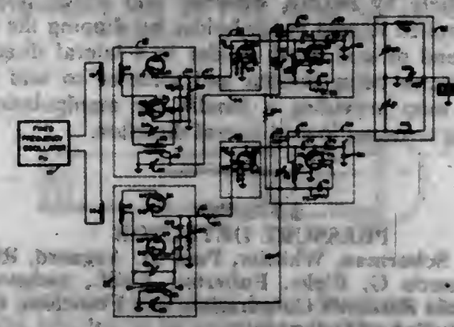
6. An apparatus for measuring the winding resistance of electrical induction apparatus having a core and characterized by a large inductive time constant comprising current supply means providing a constant direct current of sufficient magnitude to saturate the core of said inductive apparatus, lead means connecting said supply means to said inductive apparatus, saturable reactor means having primary and secondary windings, said primary windings being connected in series with said lead means, said secondary windings providing a voltage proportional to said constant direct current, and calibrated circuit means for comparing said voltage with the voltage drop across the windings of said inductive apparatus.

---



2,772,396
**FREQUENCY METER OR THE LIKE**
James L. Buie, Sun Valley, Calif., assignor to Hoffman Electronics Corporation, a corporation of California
Application March 3, 1954, Serial No. 413,894
3 Claims. (Cl. 324—78)

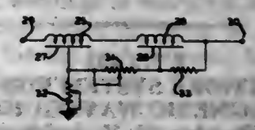
1. A frequency meter including, in combination, first and second input terminals, a resistor, and a reactor having first and second terminals, said first input terminal being coupled through said resistor to said first terminal of said reactor, said second input terminal being coupled to said second terminal of said reactor, and said reactor having in addition a saturable core exhibiting constant saturation flux level and a rectangular hysteresis loop; a full-wave rectifier having an input circuit and an output circuit, said rectifier input circuit being coupled across said first and second terminals of said reactor; and a meter having a D'Arsonval-type movement, said meter being coupled to said output circuit of said rectifier.



2,772,397
**LOGARITHMIC ELECTRICAL MEASURING SYSTEM**
Theodore A. Rich, Schenectady, N. Y., assignor, by mesne assignments, to the United States of America as represented by the Secretary of the Navy
Application April 7, 1952, Serial No. 280,883
3 Claims. (Cl. 324—99)

1. A system for measuring the magnitude of an electrical input and simultaneously producing an electrical output which is proportional to the logarithm of said electrical input comprising a logarithmic galvanometer having a first rotatable shaft, a metallic flag carried by said first shaft adapted to be deflected an amount which is approximately proportional to the logarithm of said electrical input, a second galvanometer having a second rotatable shaft axially aligned with said first shaft, a coil mounted on said second shaft proximate to said flag, follow-up means coupled to said coil for producing an electrical output in response to the movement of said flag relative to said coil which is of the proper magnitude to cause said second galvanometer to deflect its shaft by an amount necessary to cause the coil to maintain its same relative position with respect to said flag, and means to adjust the response characteristic of said second galvanometer, said electrical output thereby being proportional to the logarithm of said electrical input.

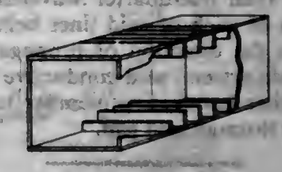
---



2,772,398
**SIMPLIFIED CIRCUITS FOR PRODUCING AMPLITUDE MODULATION**
Oscar B. Dutton, Redondo Beach, Calif., assignor to Hoffman Electronics Corporation, a corporation of California
Application September 17, 1953, Serial No. 380,770
7 Claims. (Cl. 332—41)

1. A circuit for producing a carrier wave amplitude modulated with an intelligence signal, including: a source of reference voltage having a frequency corresponding to that desired for said carrier wave; a first oscillator adjusted to have an output voltage at the frequency of said reference voltage but having a first predetermined unmodulated phase lagging the phase of said reference voltage by $(n90-\theta)$ degrees, where $n$ is odd; first automatic means connected to said first oscillator and including a first comparison circuit for developing a first error voltage when the phase of the output voltage from said first oscillator deviates from its predetermined relationship with respect to that of said reference voltage; first output means for selecting a portion of the output power from said first oscillator; a second oscillator adjusted to have an output voltage at the frequency of said reference voltage but having a second predetermined unmodulated phase lagging the phase of said reference voltage by $(n90+\theta)$ degrees, where $n$ is odd; second automatic means connected to said second oscillator and including a second comparison circuit for developing a second error voltage when the phase of the output voltage from said second oscillator deviates from its predetermined relationship with respect to that of said reference voltage; second output means for selecting a portion of the output power from said second oscillator; means for superimposing an intelligence signal voltage on said first error voltage in a first phase and on said second error voltage in an opposite phase; and a combining network connected to said first and second output means.

---

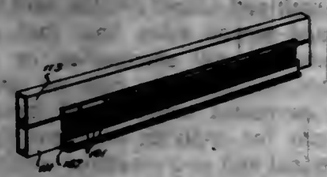


2,772,399
**CODED DATA TRANSMISSION SYSTEM**
Andrew R. Jacobson, Somerville, Mass., assignor, by mesne assignments, to the United States of America as represented by the Secretary of the Navy
Application September 19, 1945, Serial No. 617,365
3 Claims. (Cl. 333—20)

1. A three terminal network having an input circuit terminal, output circuit terminal and a terminal common to both input and output circuits, said network comprising, first and second delay lines each comprising a cylindrical inductive coil surrounded by a cylindrical outer conductor, the inductive coils of said delay lines being serially connected between said input and output terminals, means for applying an input signal between said input terminal and said common terminal, a first resistor connected between the outer conductors of said first and second delay lines, a second resistor connected between the outer conductor of said first delay line and said common terminal, and a third resistance having the characteristic impedance of said second delay line connected between the outer conductor of said second delay line and said output terminal.

---

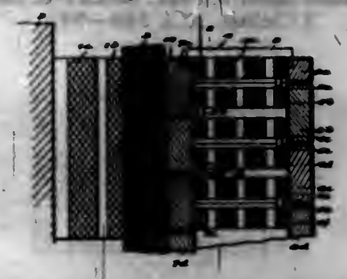
2,772,400
**MICROWAVE POLARIZATION CHANGER**
Alan J. Simmons, Hyattsville, Md., assignor to the United States of America as represented by the Secretary of the Navy
Application January 8, 1954, Serial No. 403,981
6 Claims. (Cl. 333—21)
(Granted under Title 35, U. S. Code (1952), sec. 266)



1. A waveguide polarization converter for shifting the relative phase of the orthogonal transverse modes of the wave to be converted which comprises: a waveguide section, a plurality of conducting fins transversely mounted and longitudinally spaced at intervals therein, said fins being dimensioned and relatively spaced to delay one of said modes and to advance its orthogonal mode, the number of fins in said plurality being sufficient to provide a total relative phase shift between said orthogonal modes of approximately 90 degrees, and means for introducing to the section an incident wave having orthogonal transverse modes of equal magnitude.

2,772,401
DELAY LINE
David Fales III, Towson, Md., assignor to The Glenn L. Martin Company, Middle River, Md., a corporation of Maryland
Application November 3, 1955, Serial No. 544,768
7 Claims. (Cl. 333—31)

1. A device comprising a pair of sections each composed of an inner and an outer conductor, said sections being axially aligned and spaced apart, each of said outer conductors defining a bore, a dielectric sleeve received in one of the bores defined by said outer conductors, a rod received in said sleeve for relative sliding movement and fixed in the other bore, each of said inner conductors defining a bore, a second dielectric sleeve received in one of the bores defined by said inner conductors, and a rod received in said second sleeve for relative sliding movement and fixed in the other bore of said inner conductors.

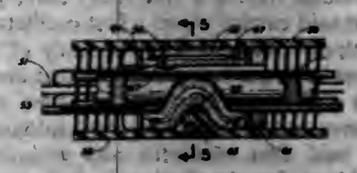


2,772,402
SERRATED CHOKE SYSTEM FOR ELECTROMAGNETIC WAVEGUIDE
Kiyo Tomiyasu, Flushing, N. Y., assignor to Sperry Rand Corporation, a corporation of Delaware
Application November 22, 1950, Serial No. 197,063
7 Claims. (Cl. 333—98)

1. In a wave guide system for transmission of microwave energy of a predetermined wavelength, a first conductive member and an adjacent second conductive member, said members being spaced apart by an elongated gap appreciably narrower than one-quarter wavelength, choke apparatus for providing very low impedance across said elongated gap, comprising a series of self-supported conductive tines on one of said members, the lengths of each of said tines being substantially equal to one-quarter wavelength, and the spacing between adjacent tines and the cross-sectional dimensions of each tine being appreciably less than one-quarter wavelength, said tines being conductively joined together at their base, each of said tines extending longitudinally in a direction substantially parallel to the adjacent surface of said other conductive member and being spaced apart therefrom by an air space appreciably less than one-quarter wavelength, the longitudinal direction of each of said tines being substantially perpendicular to the direction of propagation of energy in said wave guide system, said conductive tines cooperating with said other conductive member to minimize the escape of energy through said gap.

2,772,403
HIGH VOLTAGE TRANSFORMER
August Meyerhans, Nussbaumen, near Baden, and Martin Christoffel, Zurich, Switzerland, assignors to Aktiengesellschaft Brown, Boveri & Cie, Baden, Switzerland
Application March 24, 1953, Serial No. 344,287
Claims priority, application Switzerland March 28, 1952
3 Claims. (Cl. 336—70)

1. In a transformer of the concentric winding type, a high voltage winding comprising a plurality of disc-type coils arranged concentrically in superposed relation and connection in series to a high voltage lead-in and to form groups of coils, the connections between adjacent coils of the groups being made alternately at the radially inner and outer sides of the coils, and a plurality of nonmagnetic electrically conductive rings arranged in relatively close superposed relation at both the inner and outer sides of said coils, said rings being insulated each



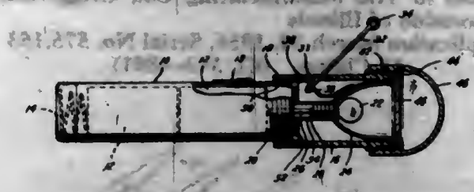
from the other and being of such length along the axis of said high voltage winding as to capacitatively bridge adjacent coils at that inner and outer side of said high voltage winding at which said series-connected coils are without connection.

2,772,404
TERMINAL
Samuel E. Peters, Racine, Wis., assignor to The Dumore Company, Racine, Wis., a corporation of Wisconsin
Application October 24, 1952, Serial No. 316,621
3 Claims. (Cl. 339—256)

1. In combination, a brush holder having a grooved portion adjacent one end, a spring terminal disposed within said groove, and a conductor secured to said terminal, said terminal comprising a resilient wire helix of slightly less than two turns and having a symmetrically disposed loop dividing said helix into two symmetrically disposed arm portions each providing an independent gripping action, each arm portion being of a length substantially less than 360° so that each arm may be expanded solely by flexure, whereby said spring terminal may be applied to said brush holder by slipping the same over the end of said brush holder in a lateral direction, said conductor being twisted and soldered to said loop, and said loop providing a handle for manipulation of said spring terminal in said lateral direction.

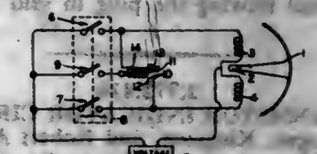
2,772,405
PRESSURE DETECTOR
Glenn A. Scharman, Whittier, Paul M. Aagaard, Rivera, and Francis G. Blake, Fullerton, Calif., assignors to California Research Corporation, San Francisco, Calif., a corporation of Delaware
Application March 24, 1954, Serial No. 418,402
2 Claims. (Cl. 340—7)

1. For use in seismic prospecting in which a streamer is towed behind a boat, the combination comprising a fiber-reinforced tube of a flexible plastic, said tube having substantially the same cross section throughout its length, a plurality of cylindrical piezoelectric crystals each having an outer diameter substantially the same as



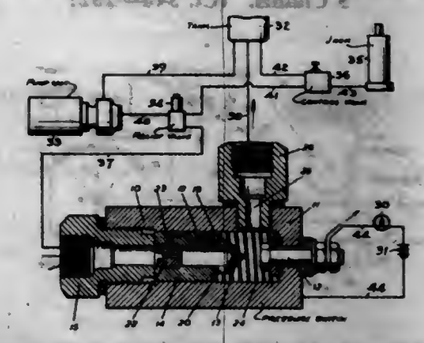
the inside diameter of said tube and having a hollow central portion, a conductive metallic coating on both the inside and outside surfaces of said crystals, respective conductors leading from said coatings to a recorder on said boat, said conductors passing through the central portion of crystals intervening between said boat and the crystal to which the conductor is connected.

2,772,406
AUTOMOBILE SAFETY LAMP
John Juergens, Miami, Fla.
Application April 25, 1952, Serial No. 284,350
2 Claims. (Cl. 340—32)



1. A lamp comprising a member adapted to be attached to an automobile, a polygonal stud on said member, said stud having an outer end circular in cross section, a locking member having a polygonal aperture fitting freely over said polygonal stud, a spring urging said locking member toward the free outer end of said stud, a hinge leaf having a circular aperture rotatably fitting over the outer end of said stud, means trapping said hinge leaf on the outer end of said stud, said locking member and said hinge leaf having cooperating protuberance and indent means normally held in engagement by said spring for locking said hinge leaf in a preselected position of adjustment, a hinge member pivotally attached to said hinge leaf, a lamp housing fixed on said hinge member, a source of illumination within said housing, and a light transmitting lens on said housing and covering said source of illumination.

2,772,407
SIGNAL ATTACHMENT
Earl W. Nichols, Lackhart, Tex.
Application May 10, 1954, Serial No. 428,482
6 Claims. (Cl. 340—213)

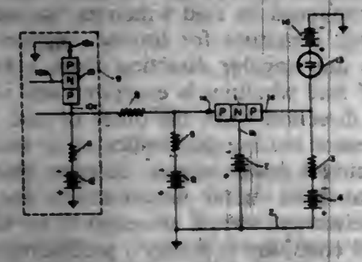


1. A signaling attachment for a flashlight comprising a housing adapted to be secured to the head of the flashlight, a reflector in the housing, a lamp bulb in the reflector, said lamp bulb having a base and an electrical contact in its rear portion, means electrically contacting the electrical contact in the rear portion of the bulb to one pole of a battery in the flashlight when the housing is secured to the flashlight, a spring arm formed of an electrical conductor electrically contacting the base of the bulb and extending from the housing, an electrical contact carried by the housing establishing electrical connection at the head of the flashlight with means in the flashlight electrically connected to another pole of the battery when the attachment is secured to the flashlight, said spring arm normally being spaced from said electrical contact but yieldingly engaging said electrical contact on movement of the arm thereby closing a circuit from the battery through the lamp bulb.

2,772,408
ANNUNCIATOR SYSTEM
Raoul L. Davis, Jr., Lynnfield Center, and Frederick W. Newman, Wenham, Mass., assignors to General Electric Company, a corporation of New York
Application December 24, 1954, Serial No. 477,568
3 Claims. (Cl. 340—220)

1. A condition indicator arrangement comprising a pair of electrical windings, an armature mounted for angular movement upon magnetic interaction with magnetic fields produced by said windings, an indicator coupled with said armature for limited angular movement therewith in one angular direction from a null position when one of said windings is energized and in the opposite angular direction when the other of said windings is energized, means biasing said indicator to said null position, an electrical power source, detector means responsive to a condition under measurement and having at least a first electrical switch arranged to be closed when the measured condition is within a predetermined normal range and a second switch arranged to be closed when the measured condition is of a minimum or zero value and a third switch arranged to be closed when the measured condition is within critical limits, an intermittent switch opening and closing electrical contacts periodically when electrically excited, means coupling one of said windings with said source through said first switch, means coupling the other of said windings with said source through said second switch, and means coupling at least one of said windings with said source through said intermittent switch contacts and through said third switch and coupling said intermittent switch for excitation by said source through said third switch, whereby said indicator is oscillated angularly when said measured condition is within said critical limits.

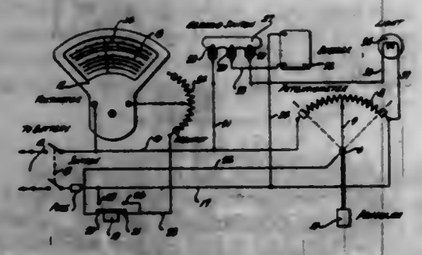
2,772,409
PRESSURE RESPONSIVE FLOW INDICATOR
Kenneth Eric Reid, London, England, assignor to Smiths Jacking Systems Limited, London, England
Application January 21, 1953, Serial No. 332,332
Claims priority, application Great Britain January 22, 1952
6 Claims. (Cl. 340—239)



1. In combination, an hydraulic apparatus having a pump, an output line from the pump and a relief valve connected to the output line, an hydraulic indicating device comprising a housing containing a movable plug, fluid inlet and outlet openings in the housing at opposite ends of the said plug, means urging the plug resiliently in

one direction, means to operate a warning device when the plug is moved in the opposite direction, a conduit through the plug and/or between the plug and the housing whereby a permanently open passage is provided for fluid flow at all times, the said conduit being of restricted cross-sectional size whereby a pressure differential is developed which fluid flows through said conduit, said pressure differential moving the plug in said opposite direction.

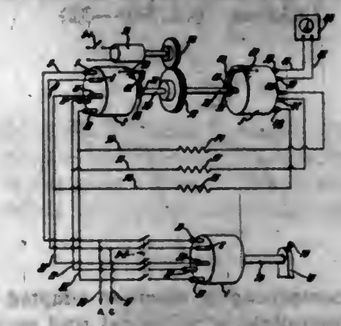
---



2,772,410
**TRANSISTOR INDICATOR CIRCUIT**
Joseph C. Logue, Kingston, and Robert A. Henle, Hyde Park, N. Y., assignors to International Business Machines Corporation, New York, N. Y., a corporation of New York
Application September 30, 1954, Serial No. 459,289
12 Claims. (Cl. 340—252)

1. Visual signal apparatus comprising a glow discharge lamp, an energizing circuit for said lamp including a resistor and a source of unidirectional electrical energy in series, said source having a potential greater than the ignition potential of the lamp, and means for controlling the potential across the lamp including circuit means for conducting a current through said resistor to produce a potential drop thereacross of a polarity and magnitude effective to reduce the potential available at the lamp below the potential required to maintain a discharge through the lamp, said circuit means comprising a transistor having a base electrode, an emitter electrode and a collector electrode, means connecting the collector electrode in series with said resistor and at least a portion of said source of energy, and means for impressing across the other electrodes of the transistor a signal potential effective to control the current flow through said collector electrode.

---



2,772,411
**BOOM ANGLE INDICATOR FOR CRANES**
Carl M. Cooper, Compton, Calif., assignor of forty per cent to S. Fishlader, Los Angeles, Calif.
Application October 25, 1954, Serial No. 464,233
3 Claims. (Cl. 340—282)

1. A boom angle indicator for cranes comprising a housing, attaching means on the housing to secure said housing to the boom, a pendulum pivotally mounted in the housing, a variable resistance, means operable by the pendulum to vary the resistance, a galvanometer, and electrical leads extending from said resistance to the galvanometer, said galvanometer being calibrated in degrees, a tilt switch mounted adjacent the galvanometer, a warning means, and electrical leads extending from the tilt switch to the warning means.

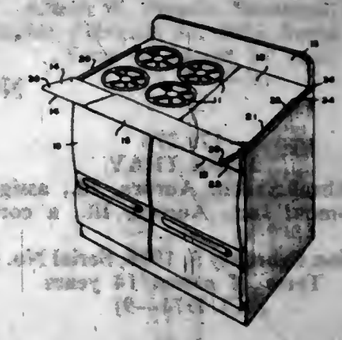
---

2,772,412
**SYNCHRO TESTING**
Thomas E. Weiher, Grand Rapids, Mich., assignor to General Motors Corporation, Detroit, Mich., a corporation of Delaware
Application February 16, 1955, Serial No. 488,683
7 Claims. (Cl. 340—315)

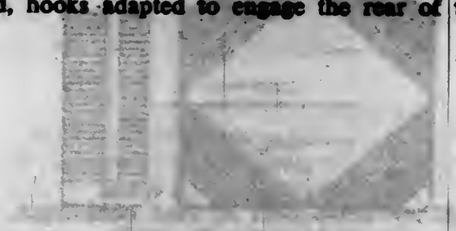
1. Test apparatus for determining how closely a synchro repeater device follows a synchro transmitter device each of which devices has a stator winding and a rotor winding, said apparatus comprising, in combination, circuit means connecting said transmitter synchro device and said test synchro device in a self-synchronous data repeater system, a pickoff synchro device having a stator winding and a rotor winding, circuit means connecting the stator winding of said pickoff synchro in a high impedance circuit to the stator windings of said transmitter synchro and said test synchro in said data repeater system, electrical indicating means connected to the rotor winding of said pickoff synchro, and mechanical coupling means interconnecting the rotors of said transmitter synchro and pickoff synchro at their electrical zero positions.

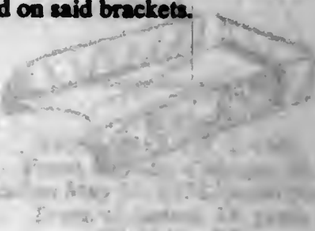
---

2,772,413
**COMPOSITE DIPOLE MULTI-CHANNEL TELEVISION ANTENNA**
John F. Guernsey and Arthur E. Vall, Griggsville, Ill., assignors to Trio Manufacturing Co., Griggsville, Ill., a corporation of Illinois
Application March 30, 1956, Serial No. 575,153
18 Claims. (Cl. 343—801)



1. A composite antenna for high frequency signals comprising a plurality of dipole elements all arranged in substantially a horizontal plane, there being three collinear dipole elements and the antenna being highly directive along an axis normal to the collinear dipole elements, a fourth dipole element centered on the said axis spaced from and parallel with the middle one of the three collinear dipole elements, the four dipole elements being substantially of the same electrical length, the said middle dipole element being a director parasitic relative said fourth dipole element and the two outboard collinear dipole elements having their inner ends electrically connected to the ends of the fourth dipole, and transmission line means connected to drive the two outboard collinear dipole elements and the fourth dipole element.

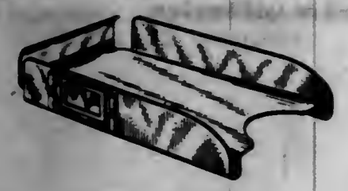




---

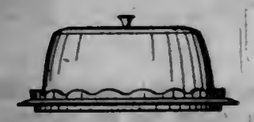
2,772,414
**STOVE GUARD**
Horace M. Baker, Jr., Lumberton, N. C.
Application June 14, 1954, Serial No. 436,381
10 Claims. (Cl. 126—214)

7. A stove guard comprising a member for disposition upon the upper portion along the marginal front edge of a stove, said guard having its longitudinal edges turned over to reinforce the same, a bracket having a horizontal and a dependent portion for engaging the top and side surfaces of the stove with such brackets supporting said guard, hooks adapted to engage the rear of the stove, spring means connecting the rear end portions of said brackets with said hooks for mounting the guard in position on the stove, and guarding means for the side of the stove mounted on said brackets.

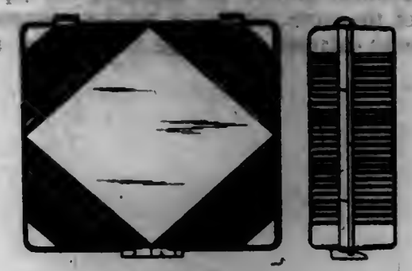


# DESIGNS

## NOVEMBER 27, 1956



**179,276**
**DESK TRAY**
Charles M. Abrahamson, Aurora, Ill., assignor to All-Steel Equipment Inc., Aurora, Ill., a corporation of Illinois
Application February 3, 1956, Serial No. 40,034
Term of patent 14 years
(Cl. D74—9)

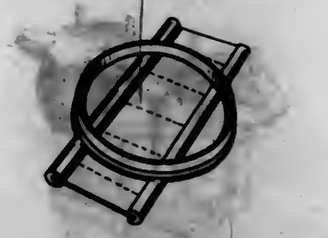


**179,277**
**BUILDING**
Marino Auriti, Kennett Square, Pa.
Application November 16, 1955, Serial No. 38,922
Term of patent 3½ years
(Cl. D13—1)

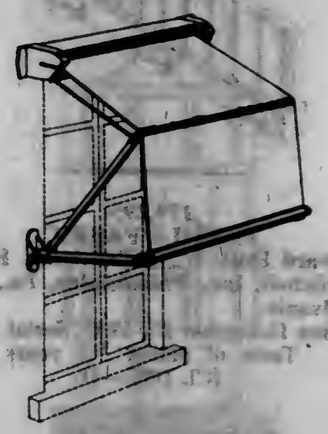
**179,278**
**COMBINED CAKE TRAY AND COVER THEREFOR OR SIMILAR ARTICLE**
Charles O. Bliss, Los Angeles, Calif.
Application July 17, 1956, Serial No. 42,269
Term of patent 14 years
(Cl. D44—1)

**179,279**
**BOX**
Jack Bloch, Leominster, Mass., assignor to Foster Grant Co., Inc., Leominster, Mass., a corporation of Massachusetts
Application April 10, 1956, Serial No. 41,017
Term of patent 14 years
(Cl. D58—12.6)

**179,280**
**MICRO-PROJECTOR**
Olin W. Boughton, Canandaigua, N. Y., assignor to Bausch & Lomb Optical Company, Rochester, N. Y., a corporation of New York
Application May 18, 1956, Serial No. 41,538
Term of patent 14 years
(Cl. D61—1)

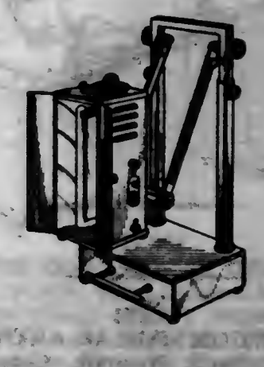


**179,281**
**SPOON OR OTHER SIMILAR ARTICLE OF FLATWARE**
Edward J. Conroy, Meriden, Conn., assignor to International Silver Company, Meriden, Conn., a corporation of New Jersey
Application July 11, 1955, Serial No. 36,890
Term of patent 14 years
(Cl. D54—12)

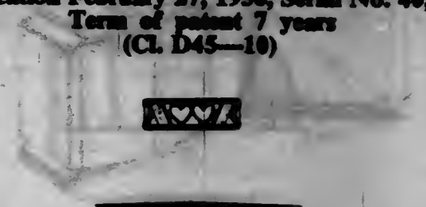


**179,282**
**HOUSE NUMBER SIGN**
Walter A. Carter, Erie, Pa.
Application November 23, 1954, Serial No. 33,282
Term of patent 3½ years
(Cl. D1—12)

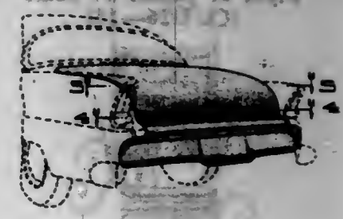
**179,283**
**AWNING**
James E. Dietz, Dayton, Ohio
Application April 20, 1955, Serial No. 35,594
Term of patent 14 years
(Cl. D21—6)



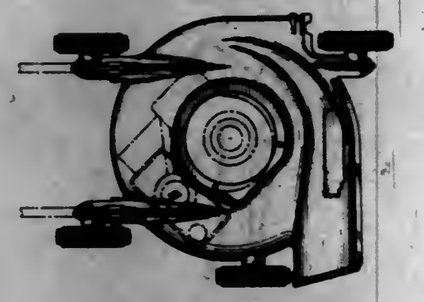
**179,284**
**CLOTHES RACK OR SIMILAR ARTICLE**
Charles Elsey, Pine Hill, N. J.
Application December 30, 1955, Serial No. 39,532
Term of patent 14 years
(Cl. D33—8)



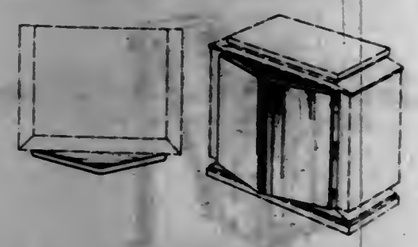
**179,285**
**HOSE NOZZLES**
Albert W. Francis, Somerset, Pa.
Application February 21, 1956, Serial No. 40,249
Term of patent 14 years
(Cl. D91—1)



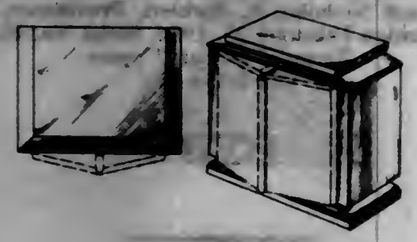
**179,286**
**THERAPEUTIC LAMP**
Frank Furedy, Chicago, Ill.
Application May 31, 1955, Serial No. 36,284
Term of patent 14 years
(Cl. D48—20)



**179,287**
**RING**
Leon A. Gainsboro, Newton Center, Dexter Gainsboro, Watertown, and Howard T. Gainsboro, Chestnut Hill, Mass., and Nicholas A. Barbieri, Providence, R. I.
Application February 27, 1956, Serial No. 40,376
Term of patent 7 years
(Cl. D45—10)

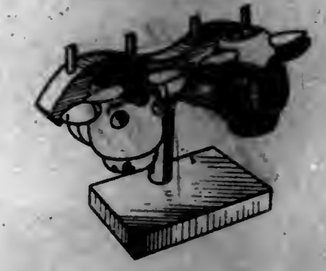


**179,288**
**AUTOMOBILE BODY**
Charles F. Glinching, Jr., Detroit, Mich., assignor to Chrysler Corporation, Highland Park, Mich., a corporation of Delaware
Application September 2, 1955, Serial No. 37,765
Term of patent 7 years
(Cl. D14—3)

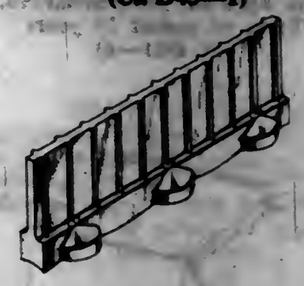


179,289
ROTARY LAWN MOWER
Henry L. Helseke, Springfield, Ill.
Application November 3, 1955, Serial No. 38,715
Term of patent 14 years
(Cl. D40—1)

179,290
CABINET OR THE LIKE
Ernest Herrmann, South Norwalk, Conn., assignor to Gettysburg Furniture Companies, Gettysburg, Pa., a limited partnership
Application February 10, 1956, Serial No. 40,103
Term of patent 3½ years
(Cl. D33—19)



179,291
CABINET OR SIMILAR ARTICLE
Ernest Herrmann, South Norwalk, Conn., assignor to Gettysburg Furniture Companies, Gettysburg, Pa., a limited partnership
Application February 10, 1956, Serial No. 40,106
Term of patent 3½ years
(Cl. D33—19)

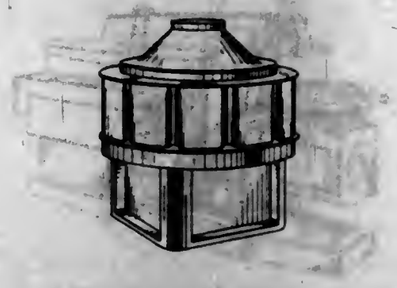


179,292
SWITCH HEAD
John A. Herrmann, Grosse Pointe Farms, and Russell S. Davis and Louis W. Higgins, Detroit, Mich., assignors to BullDog Electric Products Co., Detroit, Mich., a corporation of West Virginia
Application October 18, 1954, Serial No. 32,703
Term of patent 14 years
(Cl. D26—13)

179,293
COMBINED CONDIMENT DISPENSER SET AND HOLDER THEREFOR
Severne Hilton, Wilton, Maine, assignor to Menschik-Goldman Company, New York, N. Y., a partnership
Application July 17, 1956, Serial No. 42,278
Term of patent 3½ years
(Cl. D44—22)

179,294
CONVEYOR BELT CLEAT
Theodore H. Hinchcliffe, Pasadena, Calif.
Application March 6, 1956, Serial No. 40,486
Term of patent 14 years
(Cl. D43—1)

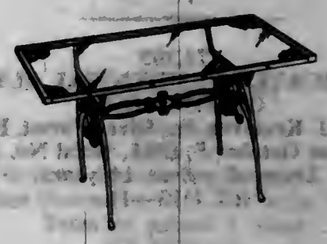
179,295
TEXTILE FABRIC
William Edward Holt, Jr., Philadelphia, Pa., assignor to E. W. Twitchell, Inc., Philadelphia, Pa., a corporation of Pennsylvania
Application December 27, 1955, Serial No. 39,495
Term of patent 3½ years
(Cl. D92—1)



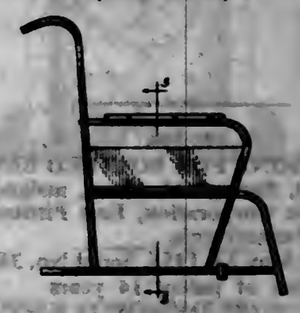
179,296
TEXTILE FABRIC
William Edward Holt, Jr., Philadelphia, Pa., assignor to E. W. Twitchell, Inc., Philadelphia, Pa., a corporation of Pennsylvania
Application December 27, 1955, Serial No. 39,496
Term of patent 3½ years
(Cl. D92—1)

179,297
HISTOLOGIC PROCESSING MACHINE
Jack Ierodi, Tuckahoe, N. Y., assignor to Technicon International, Ltd., Chancery, N. Y., a corporation of New York
Application December 22, 1955, Serial No. 39,433
Term of patent 14 years
(Cl. D83—1)

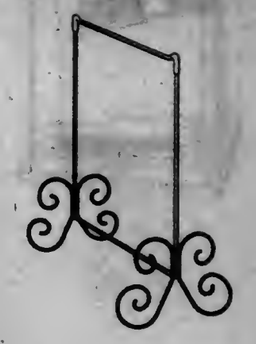
179,298
HISTOLOGIC PROCESSING MACHINE
Jack Ierodi, Tuckahoe, N. Y., assignor to Technicon International, Ltd., Chancery, N. Y., a corporation of New York
Application December 22, 1955, Serial No. 39,434
Term of patent 14 years
(Cl. D83—1)



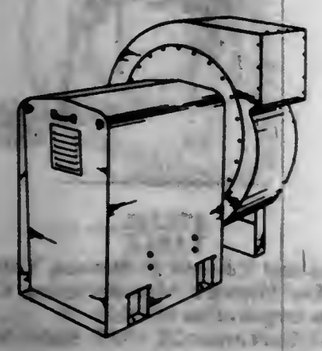
179,299
CHAIR
Robert E. Kjer Jainshens, Manhattan Beach, Calif., assignor to Virtue Bros. Mfg. Co., Los Angeles, Calif., a corporation of California
Application March 26, 1956, Serial No. 40,770
Term of patent 14 years
(Cl. D15—1)



179,300
TABLE
James E. Jones and Edward P. Stevens, Toledo, Ohio, assignors to The Hettrick Manufacturing Company, Toledo, Ohio, a corporation of Ohio
Application December 27, 1955, Serial No. 39,482
Term of patent 14 years
(Cl. D33—14)

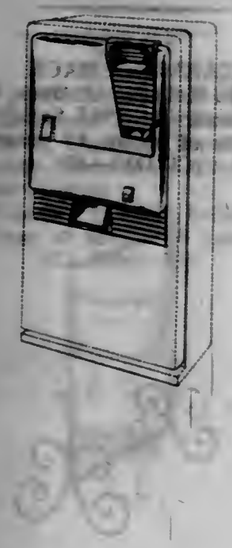


179,301
TABLE
James E. Jones and Edward P. Stevens, Toledo, Ohio, assignors to The Hettrick Manufacturing Company, Toledo, Ohio, a corporation of Ohio
Application December 27, 1955, Serial No. 39,483
Term of patent 14 years
(Cl. D33—14)

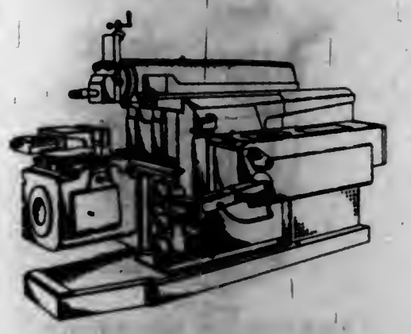


179,302
SIDE FRAME FOR INVALID WHEEL CHAIR
James E. Jones, Toledo, Ohio, assignor to Gendron Wheel Company, Perrysburg, Ohio, a corporation of Ohio
Application December 28, 1955, Serial No. 39,506
Term of patent 7 years
(Cl. D15—1)

179,303
GARMENT RACK
Beverly Jo Kellogg, Altadena, Calif.
Application January 24, 1955, Serial No. 34,168
Term of patent 14 years
(Cl. D33—8)



179,304
FAN UNIT
John B. Koch, Detroit, Mich., assignor to American Blower Corporation, Detroit, Mich., a corporation of Delaware
Application July 28, 1955, Serial No. 37,150
Term of patent 14 years
(Cl. D62—2)



179,305
PREFABRICATED RESIDENTIAL BUILDING OR THE LIKE
Otto J. Kralovec, Jr., River Forest, Ill.
Application October 5, 1955, Serial No. 38,231
Term of patent 14 years
(Cl. D13—1)

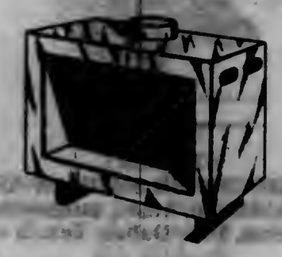
179,306
VENDING MACHINE FOR BOTTLED BEVERAGES
Raoul A. Lambert, Springfield, Mass., assignor to Westinghouse Electric Corporation, East Pittsburgh, Pa., a corporation of Pennsylvania
Application May 23, 1955, Serial No. 36,166
Term of patent 14 years
(Cl. D52—3)

179,307
METAL SHAPER
John McLeod Little and Folke Malcolm Gustafson, Toledo, Ohio, assignors to The Cincinnati Shaper Co., Cincinnati, Ohio, a corporation of Ohio
Application January 16, 1956, Serial No. 39,781
Term of patent 14 years
(Cl. D54—14)

179,308
DOLL
Anna L. Maugin, San Jose, Calif.
Application July 23, 1956, Serial No. 42,328
Term of patent 7 years
(Cl. D34—4)

179,309
DOLL
Anna L. Maugin, San Jose, Calif.
Application July 23, 1956, Serial No. 42,329
Term of patent 7 years
(Cl. D34—4)

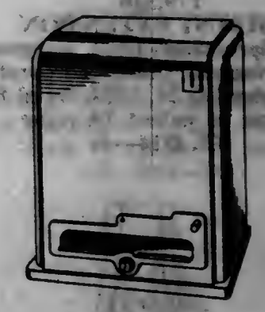
179,310
DOLL
Anna L. Maugin, San Jose, Calif.
Application July 23, 1956, Serial No. 42,336
Term of patent 7 years
(Cl. D34—4)



179,311
FOLDING STEPS
Grosvenor D. Marcy, Newton, Mass.
Application September 7, 1955, Serial No. 37,835
Term of patent 14 years
(Cl. D15—3)

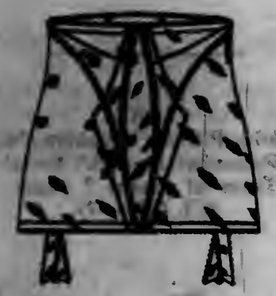
179,312
FIREPLACE STOVE
Dona Pierce and John A. Manchester, Medina, Wash.
Application April 6, 1953, Serial No. 24,357
Term of patent 14 years
(Cl. D61—7)

179,313
TEXTILE FABRIC
George W. Pitt, New York, N. Y., assignor to John Boyle & Company, Incorporated, New York, N. Y., a corporation of New York
Application April 6, 1955, Serial No. 35,383
Term of patent 14 years
(Cl. D92—1)

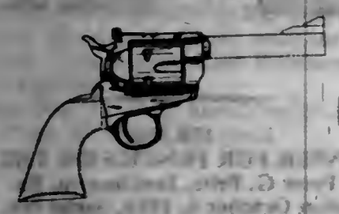


179,314
TEXTILE FABRIC
George W. Pitt, New York, N. Y., assignor to John Boyle & Company, Incorporated, New York, N. Y., a corporation of New York
Application April 6, 1955, Serial No. 35,384
Term of patent 14 years
(Cl. D92—1)

179,315
CLOCK
Nicholas Pitrelli, Brooklyn, N. Y.
Application December 16, 1955, Serial No. 39,356
Term of patent 7 years
(Cl. D42—7)

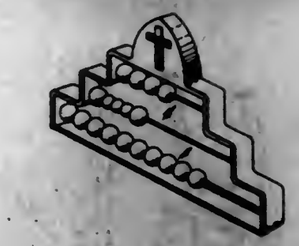


179,316
DISPENSER FOR PENCILS OR THE LIKE
Peter G. Pritz, Jenkintown, Pa.
Application October 6, 1954, Serial No. 32,565
Term of patent 7 years
(Cl. D52—3)



179,317
DOOR KNOCKER
Ted C. Bingaman, Marlemont, Ohio
Application April 22, 1955, Serial No. 35,634
Term of patent 7 years
(Cl. D10—7)

179,318
GIRDLE
Jack E. Robbins, New York, N. Y.
Application July 9, 1956, Serial No. 42,186
Term of patent 14 years
(Cl. D20—2)



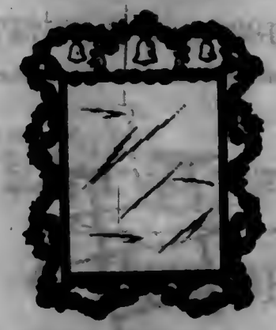
179,319
REVOLVER
William B. Ruger, Greens Farms, Conn., assignor to Sturm, Ruger & Company, Inc., Southport, Conn., a corporation of Connecticut
Application April 14, 1955, Serial No. 35,517
Term of patent 14 years
(Cl. D30—1)

179,320
EXHAUST EXTENSION
Linus E. Russell, Springfield, Ohio, assignor to Peters & Russell, Inc., Springfield, Ohio, a corporation of Ohio
Application September 24, 1954, Serial No. 32,429
Term of patent 14 years
(Cl. D14—6)

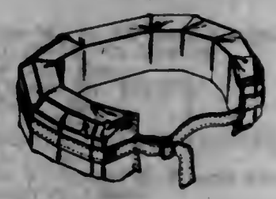
179,321
ROSARY
Mary E. Sacksteder, Dayton, Ohio
Application December 12, 1956, Serial No. 39,298
Term of patent 14 years
(Cl. D45—16)

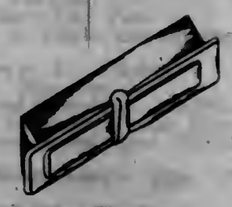
179,322
SPEED REDUCER OR SIMILAR ARTICLE
Martin T. Schumb, Milton, Mass., assignor to The Murray Company of Texas, Inc., Dallas, Tex., a corporation of Delaware
Application May 27, 1955, Serial No. 36,269
Term of patent 14 years
(Cl. D55—1)

179,323
SPEED REDUCER OR SIMILAR ARTICLE
Martin T. Schumb, Milton, Mass., assignor to The Murray Company of Texas, Inc., Dallas, Tex., a corporation of Delaware
Application May 27, 1955, Serial No. 36,271
Term of patent 14 years
(Cl. D55—1)



179,324
SPEED REDUCER OR SIMILAR ARTICLE
Martin T. Schumb, Milton, Mass., assignor to The Murray Company of Texas, Inc., Dallas, Tex., a corporation of Delaware
Application May 27, 1955, Serial No. 36,272
Term of patent 14 years
(Cl. D55—1)

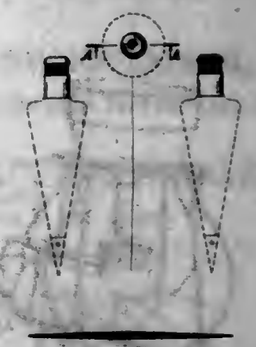




179,325
PICTURE FRAME
Irving Silverman, Flushing, N. Y., assignor to Guild Crest Corporation of America, Jersey City, N. J., a corporation of New Jersey
Application April 5, 1956, Serial No. 40,943
Term of patent 7 years
(Cl. D29—20)

179,326
COMBINATION SWIM AND WATER SKI BELT
James Bruce Stansell, Dallas, Tex.
Application February 13, 1956, Serial No. 40,141
Term of patent 7 years
(Cl. D71—1)

179,327
TIE RACK
Peter Steinau, Shelton, Conn.
Application May 17, 1954, Serial No. 30,517
Term of patent 14 years
(Cl. D33—8)



179,328
CHOCK OR SIMILAR ARTICLE
Donald E. Stewart, Grand Rapids, Mich., assignor to Jervis Corporation, Grandville, Mich., a corporation of Michigan
Application March 5, 1956, Serial No. 40,455
Term of patent 14 years
(Cl. D54—11)

179,329
PRETERNATURAL DENTURE
George L. St. Pierre, San Fernando, and Van D. Patterson, North Hollywood, Calif.
Application March 22, 1956, Serial No. 40,728
Term of patent 14 years
(Cl. D24—1)

179,330
PLUMB BOB
Lew Saverkrop, Bakersfield, Calif.
Application December 17, 1954, Serial No. 33,595
Term of patent 14 years
(Cl. D52—1)

179,331
CHAMPAGNE BOTTLE STOPPER
Floyd A. Terwilliger, Rochester, N. Y.
Application January 13, 1956, Serial No. 39,745
Term of patent 14 years
(Cl. D58—26)

179,332
SPRAY ATTACHMENT FOR VACUUM CLEANERS
Council A. Tucker, Glendale, Calif., assignor to Interstate Precision Products Corporation, Anaheim, Calif., a corporation of California
Application May 22, 1956, Serial No. 41,592
Term of patent 7 years
(Cl. D9—2)

179,333
BOTTLE CAP
Earl S. Tupper, Smithfield, R. I.
Application September 16, 1955, Serial No. 37,962
Term of patent 14 years
(Cl. D58—26)

179,334
**FIRE POT**

Milo E. Webster, Rochester, N. Y., assignor to Otto Bernz Co., Rochester, N. Y., a corporation
Application February 27, 1956, Serial No. 40,366
Term of patent 14 years
(Cl. D81—10)

179,335
**FOLDING CHAIR**

Raisel Wright, New York, N. Y., assignor to Skwayder Brothers, Ecorse, Mich., a corporation of Colorado
Application March 18, 1953, Serial No. 24,069
Term of patent 14 years
(Cl. D15—1)

# LIST OF REISSUE PATENTEES

TO WHOM

## PATENTS WERE ISSUED ON THE 27TH DAY OF NOVEMBER, 1956

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

Becton Dickinson and Co.: *See*—
May, Edwin A. Re. 24,241.
Canfora, Arthur E., to Radio Corp. of America. Electronic phase shifting system. Re. 24,240, 11–27–56, Cl. 250—27.
May, Edwin A., to Becton Dickinson and Co. Injection apparatus. Re. 24,241, 11–27–56, Cl. 128—173.
Radio Corp. of America: *See*—
Canfora, Arthur E. Re. 24,240.

# LIST OF PLANT PATENTEES

Hemet Wholesale: *See*—
Lindquist, Robert V. 1,531.
Jackson & Perkins Co.: *See*—
Lens, Louis. 1,530.
Lens, Louis, to Jackson & Perkins Co. Rose plant. 1,530, 11–27–56, Cl. 47—61.
Lindquist, Robert V., to Hemet Wholesale. Rose plant. 1,531, 11–27–56, Cl. 47—61.

# LIST OF DESIGN PATENTEES

Abrahamson, Charles M., to All-Steel Equipment Inc. Desk tray. 179,276, 11–27–56. Cl. D74—9.
All-Steel Equipment Inc.: *See*—
Abrahamson, Charles M. 179,276.
American Blower Corp.: *See*—
Koch, John B. 179,304.
Auriti, Marino. Building. 179,277, 11–27–56, Cl. D13—1.
Barbieri, Nicholas A.: *See*—
Gainsboro, Leon A., D., and H. T., and Barbieri. 179,287.
Bausch & Lomb Optical Co.: *See*—

Suverkrop, Lew. Plumb bob. 179,330, 11-27-56, Cl. D52—1.
Technicon International, Ltd.: *See*—
Isreell, Jack. 179,297.
Isreell, Jack. 179,298.
Terwilliger, Floyd A. Champagne bottle stopper. 179,331, 11-27-56, Cl. D58—26.
Tucker, Council A., to Interstate Precision Products Corp. Spray attachment for vacuum cleaners. 179,332, 11-27-56, Cl. D9—2.
Tupper, Earl S. Bottle cap. 179,333, 11-27-56, Cl. D58—26.
Twitchell, E. W., Inc.: *See*—
Holt, William E., Jr. 179,295.
Holt, William E., Jr. 179,296.
Virtue Bros. Mfg. Co.: *See*—
Jakobsen, Robert E. K. 179,299.
Webster, Milo E., to Otto Beras Co. Fire pot. 179,334, 11-27-56, Cl. D31—10.
Westinghouse Electric Corp.: *See*—
Lambert, Raoul A. 179,306.
Wright, Russel, to Shwayder Bros. Folding chair. 179,335, 11-27-56, Cl. D15—1.

# LIST OF PATENTEES

TO WHOM

## PATENTS WERE ISSUED ON THE 27TH DAY OF NOVEMBER, 1956

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

ACF Industries, Inc.: *See*—
Hollabaugh, Max G., Sher, and Wisner. 2,772,135.
Nielsen, Axel. 2,771,769.
A & W Machine Co., The: *See*—
Wilson, Harry A. 2,771,908.
Aagaard, Paul M.: *See*—
Scharman, Glenn A., Aagaard, and Blake. 2,772,405.
Acme Homes Metal Works, Inc.: *See*—
Duncan, William A. 2,771,616.
Aerojet-General Corp.: *See*—
Harkey, George D., Jr., and Hawk. 2,771,915.
Malina, Frank J., and Parsons. 2,771,739.
Aghnides, Elia P. Ash tray with a large number of cavities for extinguishing cigarettes. 2,771,884, 11-27-56, Cl. 131—235.
Agriculture, United States of America as represented by the Secretary of: *See*—
Hansen, John E., and Dietz. 2,772,251.
Reeves, Wilson A., and Guthrie. 2,772,188.
Åkesson, Stig P. E.: *See*—
Holmqvist, Nils E. F., and Åkesson. 2,772,319.
Aklin, George H., to Eastman Kodak Co. Seven-element Gauss type objective comprising two negative meniscus components enclosed by two positive components. 2,771,817, 11-27-56, Cl. 88—57.
Aktiengesellschaft Brown, Boveri & Cie.: *See*—
Meyerhans, August, and Christoffel. 2,772,403.
Allen, Charles F. H., and J. J. Sagura, to Eastman Kodak Co. Photographic silver halide emulsions containing 1-thia-3,5,7-triazaindenes. 2,772,164, 11-27-56, Cl. 96—109.
Allen, Charles F. H., and J. E. Byers, Jr., to Eastman Kodak Co. 3-pyrazolidones. 2,772,282, 11-27-56, Cl. 260—310.
Aller, Paul E., and S. E. Hotchkiss. Differential synchro. 2,772,374, 11-27-56, Cl. 310—115.
Allied Chemical & Dye Corp.: *See*—
Joris, George G., and Sweet. 2,772,145.
Allison, Albert R., A. D. Delman, and B. B. Simms, to the United States of America as represented by the Secretary of the Navy. Method of testing antiosodant chemicals. 2,771,777, 11-27-56, Cl. 73—432.
All-Fil Welding Metals, Inc.: *See*—
Laston, Theodore I., and Kriewall. 2,772,846.
Alterio, Joseph and L. Anti-skid and anti-bogging device for tires. 2,771,929, 11-27-56, Cl. 152—222.
Alterio, Louis: *See*—
Alterio, Joseph and L. 2,771,929.
Altman, Peter, and L. D. Bakke, to Continental Motors Corp. Cooling system for air cooled engines. 2,771,862, 11-27-56, Cl. 123—41.65.
Ambelang, Friedrich W. H. Feeding device for the workpiece on planing machines. 2,771,920, 11-27-56, Cl. 144—114.
Ambelang, Friedrich W. H. Planing machine for two-sided planing in a single operation. 2,771,921, 11-27-56, Cl. 144—117.
American Can Co.: *See*—
Foord, Delbert C. 2,772,043.
Pechy, William. 2,771,916.
Schroeder, George O. 2,772,247.
Weber, Lloyd H. 2,771,983.
Webbe, Delbert E., and Stanewich. 2,772,192.
American Dispenser Co., Inc.: *See*—
Dobkin, William J. 2,772,116.
American Flexible Coupling Co.: *See*—
Shenk, Robert H., and Pontius. 2,771,794.
American Home Products Corp.: *See*—
Jacobs, Morris B. 2,772,202.
Tint, Howard. 2,772,201.
American Linen Supply Co.: *See*—
Birr, Rudolph G. 2,772,133.
American Metasol Mfg. Corp.: *See*—
Dempster, Charles B. 2,772,185.
American Oil Co., The: *See*—
Haven, Allan M. 2,771,776.
American Optical Co.: *See*—
Folland, Willard R., and Ellis. 2,771,878.
American Smelting and Refining Co.: *See*—
Hollander, Max L., and Lobedeff. 2,772,230.
American Type Founders Co., Inc.: *See*—
Klingelhuss, Eugene H. 2,772,055.
Ames, W. R., Co.: *See*—
Sherman, Roger M., and Mosher. 2,771,904.
Anchor Hocking Glass Corp.: *See*—
Crabtree, Harold L. 2,772,012.
Stover, Harry E. 2,772,013.
Anderson, Peter, to Washington Iron Works Co. Power-driven guy drum. 2,772,071, 11-27-56, Cl. 254—161.
Andrew, Richard G. Tubular electronic unit. 2,772,380, 11-27-56, Cl. 317—101.
Ardissone, Joseph E., and J. M. Harper, to Westinghouse Electric Corp. Coil filament coating machine. 2,771,856, 11-27-56, Cl. 118—423.
Argabrite, George A., to Pacific Transducer Corp. Surface thermometer with magnetic retaining means. 2,771,775, 11-27-56, Cl. 73—343.
Armour and Co.: *See*—
Fischer, Elias. 2,772,172.
Riegler, Werner L., and Atherton. 2,772,174.
Armstrong Cork Co.: *See*—
Dunlap, Lawrence H. 2,772,141.
Armstrong, Frederick E.: *See*—
Hamontre, Hugh C., Mueller, and Armstrong. 2,771,686.
Armstrong, John W., E. W. Spears, and R. D. Williams, to General Motors Corp. Method of coating interior of tubing with zinc. 2,771,669, 11-27-56, Cl. 29—429.
Army, United States of America as represented by the Secretary of the: *See*—
Kazan, Benjamin. 2,772,377.
Arnott, Edward G. F., and R. H. Atkinson, to Westinghouse Electric Corp. Photoflash lamp. 2,771,765, 11-27-56, Cl. 67—31.
Artingstall, Thomas W., and E. F. Feigl, to Solar Mfg. Corp. Capacitor testing apparatus. 2,771,992, 11-27-56, Cl. 206—81.
Atherton, James G.: *See*—
Riegler, Werner L., and Atherton. 2,772,174.
Atkinson, Russell H.: *See*—
Arnott, Edward G. F., and Atkinson. 2,771,765.
Atlas Mineral Products Co. of Pennsylvania, The: *See*—
Seymour, Raymond B. 2,771,985.
Automatic Electric Laboratories, Inc.: *See*—
Woodruff, Albert E. 2,772,290.
Ayers, Arnold L.: *See*—
Scott, Cleveland E., and Ayers. 2,771,738.
Scott, Cleveland E., Ayers, and Mahan. 2,771,737.
Aymerich, Jose M. B. System for drafting fibrous materials. 2,771,639, 11-27-56, Cl. 19—130.
Bachmann, Rudolph E., to Trans-American Precision Instrument Corp. Differential gearing apparatus. 2,771,791, 11-27-56, Cl. 74—675.
Bailey, William R., to Minneapolis-Honeywell Regulator Co. Controller having an output proportional to the product of two inputs. 2,771,897, 11-27-56, Cl. 137—85.
Baker, Albert B.: *See*—
McIlhenny, William F., Baker, and Clarke. 2,772,143.
Baker, Harold E. Door framing jig. 2,771,688, 11-27-56, Cl. 33—194.
Baker, Horace M., Jr. Stove guard. 2,771,873, 11-27-56, Cl. 126—214.
Baker, Horace M., Jr. Stove guard. 2,772,414, 11-27-56, Cl. 126—214.
Bakke, Laurence D.: *See*—
Altman, Peter, and Bakke. 2,771,862.
Baldwin, Richard E., to Powers-Samas Accounting Machines Ltd. Record card controlled statistical machines. 2,772,051, 11-27-56, Cl. 235—61.6.
Ball, Albert L., to Bay State Abrasive Products Co. Process of forming a durable open mesh fabric. 2,771,659, 11-27-56, Cl. 28—73.
Ball, Charles F., to Joy Mfg. Co. Hydraulic drive with pressure equalizer and control for plural motors. 2,771,968, 11-27-56, Cl. 180—6.48.
Baril, Edward J. Adjustable mounting devices for window cleaning squeegee and other articles. 2,771,623, 11-27-56, Cl. 15—144.
Barnard, Daniel P., 4th, to Standard Oil Co. Low-temperature starting of gas turbine engines. 2,771,741, 11-27-56, Cl. 60—39.06.
Barnes, William A., to Utica Drop Forge & Tool Corp. Offset grip for split dies and method of making same. 2,772,095, 11-27-56, Cl. 279—57.
Barnhart, George, and B. F. Skiles, to E. I. du Pont de Nemours & Co. Solvent-soluble, complex, phthalocyanine-yielding compounds. 2,772,284, 11-27-56, Cl. 260—314.5.
Barr, Charles E.: *See*—
Salminen, Ilmari F., and Barr. 2,772,162.
Barratt, Jesse, to Scovill Mfg. Co. Snap fastener socket. 2,771,652, 11-27-56, Cl. 24—216.
Bartels, Alfred F. A., and P. F. W. Johmann, to Nordlocher Maschinenbau Rud. Baader. Method of preparing fishless fish fillets. 2,771,633, 11-27-56, Cl. 17—45.
Batchelder, James W. Thread rolling tool. 2,771,799, 11-27-56, Cl. 80—6.
Batts Harvey J.: *See*—
Iknayan, Alfred N., Peterson, and Batts. 2,771,936.
Bauman, William C., and D. F. Harrington, to The Dow Chemical Co. Process for removing acids from aqueous solutions of organic solutes with ion exchange resins. 2,772,237, 11-27-56, Cl. 210—24.
Bay State Abrasive Products Co.: *See*—
Ball, Albert L. 2,771,659.
Beatty, Allan W., to Welding Fittings Corp. Fabrication of branched fittings. 2,771,665, 11-27-56, Cl. 29—157.
Beatty, Julian L., and R. T. Florence, to A. B. Dick Co. Stencil duplicating inks. 2,772,175, 11-27-56 Cl. 106—28.
Beckwith, John O. Cigarette lighter. 2,771,762, 11-27-56, Cl. 67—7.1.
Becton, Dickinson and Co.: *See*—
Molinari, Henry G., and Magash. 2,771,710.

Bekoff, Irving. Folding display paperboard box or cover. 2,771,966, 11–27–56, Cl. 206—45.3.

Bell, Leon J., to The National Smelting Co. Ltd. Production of sulphuryl fluoride. 2,772,144, 11–27–56, Cl. 23—203.

Bell, Norton W.: *See*—
Robinson, Charles F., Bell, Piccirillo, and Perkins. 2,772,367.

Bell Telephone Laboratories, Inc.: *See*—
Shockley, William. 2,772,360.

Benbow, Burtis W. Drill press. 2,771,797, 11–27–56, Cl. 77—29.

Bendiksen, Olaf T., to Lockheed Aircraft Corp. Actuating and locking mechanism. 2,772,060, 11–27–56, Cl. 244—102.

Bendix Aviation Corp.: *See*—
Lafitte, Theodore J.-B. 2,771,780.
Miller, John M., Jr. 2,772,329.
Noxon, Paul A., and MacCallum. 2,772,059.
Whitney, Maurice P. 2,771,792.

Bennett, Ralph O., and E. J. Weichel. Electric branding iron. 2,772,339, 11–27–56, Cl. 219—30.

Bensch, Emil: *See*—
Schaeffer, Georg, and Bensch. 2,772,128.

Bents, Ralph W., to Eastman Kodak Co. Antioxidant concentrates comprising reaction products of mixed glycerides as solvent carriers. 2,772,243, 11–27–56, Cl. 252—399.

Berard, Henry. Motorized carrier for multiple golf bags. 2,772,113, 11–27–56, Cl. 296—24.

Berg, Robert L.: *See*—
Bushnell, James D., and Berg. 2,772,220.

Bergling, Charles G. B., to Durox International S. A. Device for sawing plastic masses. 2,771,872, 11–27–56, Cl. 125—18.

Bergstrom, Eric V., and E. R. J. Sorf, to Socony Mobil Oil Co., Inc. Method and apparatus for continuously removing fines from a moving bed conversion system. 2,772,223, 11–27–56, Cl. 196—52.

Bergstrom, Eric V., and E. J. Sorf, to Socony Mobil Oil Co., Inc. Method and apparatus for effecting conversion of hydrocarbons. 2,772,225, 11–27–56, Cl. 196—52.

Bergstrom, Hilding O. V.: *See*—
Trobeck, Karl G., and Bergstrom. 2,772,240.

Berry, Clifford E., to Consolidated Electrodynamics Corp. Mass spectrometry. 2,772,366, 11–27–56, Cl. 250—41.9.

Bethlehem Steel Co.: *See*—
Rechtin, Eberhardt C. 2,771,747.

Better, Bernard R., and J. W. Lehde, Jr., to Scully-Jones and Co. Predetermined torque release wrench. 2,771,804, 11–27–56, Cl. 81—52.4.

Betten, Richard S., Jr., to Standard Oil Co. Removal of water from solid polymers. 2,771,689, 11–27–56, Cl. 34—17.

Betts, Irene E., ½ to E. I. Boyd. Protective device for infants. 2,771,881, 11–27–56, Cl. 128—287.

Beusch, Andrew. Angular work table. 2,771,821, 11–27–56, Cl. 90—59.

Biggs, Glenn L. Fishhook guard. 2,771,704, 11–27–56, Cl. 43—54.5.

Binder, Robert: *See*—
Porsche, Ferdinand A. E., and Binder. 2,771,863.

Bir, Rudolph G., to American Linen Supply Co. Dispensing apparatus for sheet material. 2,772,133, 11–27–56, Cl. 312—38.

Bituminous Coal Research, Inc.: *See*—
Yellott, John I., and Buckley. 2,771,962.

Blake, Francis G.: *See*—
Schurman, Glenn A., Aagaard, and Blake. 2,772,405.

Blake, Francis G., Jr., to California Research Corp. Method of initiating underwater seismic disturbances. 2,771,961, 11–27–56, Cl. 181—.5.

Blanchard, Loring W., Jr.: *See*—
Malm, Carl J., and Blanchard. 2,772,266.

Bleuenstein, Julius M., to Ford Motor Co. Remote strike off. 2,771,649, 11–27–56, Cl. 22—193.

Blocksage, Norman S. V-block formations. 2,771,822, 11–27–56, Cl. 90—59.

Blood, Harold L.: *See*—
Schmidt, William D., and Blood. 2,771,714.

Blue, John, Co., Inc.: *See*—
Horton, Donelson B., and Johnston. 2,771,846.

Blumensaadt, Svend G., to The Universal Wire Spring Co. Device for longitudinally reshaping corrugated wire springs. 2,771,912, 11–27–56, Cl. 140—89.

Bobo, Frank E., Jr.: *See*—
Leath, William J., and Bobo. 2,771,733.
Leath, William J., and Bobo. 2,771,759.

Bogart, Lee J.: *See*—
Sahlbom, Olaf A. 2,771,829.

Bois, Erven Lucas, Inc.: *See*—
Flaschner, Ewald. 2,771,913.

Bond, William. Dishwashing machine. 2,771,895, 11–27–56, Cl. 134—172.

Bookout, Ervin J., and G. T. Hutchison, to Cochrane Corp. Liquid treatment apparatus. 2,772,235, 11–27–56, Cl. 210—16.

Boothroyd, Wilson P., to Philco Corp. Electrical systems. 2,772,324, 11–27–56, Cl. 178—5.4.

Borg-Warner Corp.: *See*—
Howe, John R. 2,772,373.
Orr, Palmer. 2,771,795.
Smirl, Richard L. 2,771,976.

Bouman, Jan, to Shell Development Co. Viscometer system. 2,771,770, 11–27–56, Cl. 73—55.

Bowen, Max E., J. A. Hanish, and T. E. Carlson, to Handling Equipment & Mfg. Co. Electric water heater. 2,772,344, 11–27–56, Cl. 219—38.

Bowen, William M., III, and E. J. Houdry, to Oxy-Catalyst, Inc. Exhaust gas treating unit. 2,772,147, 11–27–56, Cl. 23—288.

Bowers, Roy L., to General Motors Corp. Filter for fluids such as gasoline. 2,772 001. 11–27–56, Cl. 210—165.

Bowser, Harley O. Electric outlet box screw plate. 2,772,062, 11–27–56, Cl. 248—27.

Boyd, Elsie I.: *See*—
Betts, Irene E. 2,771,881.

Boyer, Robert Q., to the United States of America as represented by the United States Atomic Energy Commission. Filtering apparatus. 2,771,999, 11–27–56, Cl. 210—113.

Brackx, Laurent H. J., to H. T. Jeandron. Means for mooring and refueling boats, seaplanes, and the like. 2,771,617, 11–27–56, Cl. 9—8.

Bradenthaler, Anthony: *See*—
Gyllenberg, John L. 2,771,922.

Bradley, Robert O., C. S. Simonds, and C. H. Jacobs, to Toledo Scale Co. Temperature compensated servo coils. 2,772,383, 11–27–56, Cl. 318—28.

Bradley, Robert W., to United Shoe Machinery Corp. Devices for finding protruding metal objects in shoes. 2,772,394, 11–27–56, Cl. 324—61.

Brahm, Charles B., to United Aircraft Corp. Safety circuit for generator unit of the jet fuel control. 2,771,742, 11–27–56, Cl. 60—39.09.

Bramble, Lloyd F., to Gulf States Asphalt Co., Inc. Asphalt lining. 2,771,745, 11–27–56, Cl. 61—7.

Brandon, Thomas O., to A. G. Spalding & Bros., Inc. Lightweight grip. 2,772,000, 11–27–56, Cl. 273—81.

Bratfisch, Warren A., and P. H. Jones, to North American Aviation, Inc. Fluid filling system. 2,771,906, 11–27–56, Cl. 137—575.

Brehm, Allen E., and E. K. Fields, to Standard Oil Co. Fuel compositions. 2,772,148, 11–27–56, Cl. 44—71.

Breidfjord, Agnar G. Fishing trawls. 2,771,702, 11–27–56, Cl. 43—9.

Brenneck, William A.: *See*—
Parducci, Ralph E., and Brenneck. 2,771,980.

Briskin, Joseph, and E. C. Chapin, to Monsanto Chemical Co. Terpolymer systems. 2,772,252, 11–27–56, Cl. 260—80.5.

Bristol, Donald E., to Ryan Recording Thermometer Co. Container for recording thermometer. 2,772,016, 11–27–56, Cl. 220—18.

British Telecommunications Research Ltd.: *See*—
Gaite, Harold D. 2,772,325.

Brogdex Co.: *See*—
McKune, Duane R. 2,771,981.

Brooks, Robert A., to E. I. du Pont de Nemours and Co. Process for producing copper-phthalocyanine precursor. 2,772,285, 11–27–56, Cl. 260—319.

Brouillette, Georges P.: *See*—
Short, Charles E., and Brouillette. 2,771,785.

Browder, Jay E., to Standard Coil Products Co., Inc. V. H. F.-U. H. F. tuners. 2,772,353, 11–27–56, Cl. 250—20.

Browder, Jay E., to Standard Coil Products Co., Inc. V. H. F.-U. H. F. tuners. 2,772,354, 11–27–56, Cl. 250—20.

Brown, Gordon H., to E. A. Peterman. Pressure regulator. 2,771,843, 11–27–56, Cl. 103—17.

Brownell, William E. Surface marking tool. 2,771,924, 11–27–56, Cl. 145—25.

Brownlow, James M., to Gulton Industries, Inc. Method for joining metallic and ceramic members. 2,771,969, 11–27–56, Cl. 189—36.5.

Bruce, George D., and J. C. Logue, to International Business Machines Corp. Binary trigger and counter circuits employing magnetic memory devices. 2,772,370, 11–27–56, Cl. 307—88.

Brugger, Alfons: *See*—
Ritzau, Inge, Brugger, and Höfler. 2,772,117.

Bryant, Austin U.: *See*—
Grove, Marvin H., and Bryant. 2,772,068.

Buckler, Roy J. Rock gathering machine. 2,771,727, 11–27–56, Cl. 55—17.

Buckley, Frederick D.: *See*—
Yellott, John I., and Buckley. 2,771,962.

Buehne, Willis G., to General Electric Co. Electric immersion heater. 2,772,343, 11–27–56, Cl. 219—38.

Buehring, Glenn H. Storage tank trailer. 2,772,010, 11–27–56, Cl. 214—394.

Buie, James L.: *See*—
Knudson, Clarence B., and Buie. 2,772,320.

Buie, James L., to Hoffman Electronics Corp. Frequency meter or the like. 2,772,396, 11–27–56, Cl. 324—78.

Bullock, Walter W.: *See*—
Harrington, Lawrence E. 2,772,026.

Burleson, Aaron, and M. N. Holmes, to Patentex, Inc. Knitting. 2,771,756, 11–27–56, Cl. 66—146.

Burleson, Aaron, and M. N. Holmes, to Patentex, Inc. Stretchable stocking. 2,771,757, 11–27–56, Cl. 66—172.

Burleson, Aaron, to Patentex, Inc. Process for producing knitted fabric. 2,771,760, 11–27–56, Cl. 66—201.

Burleson, Aaron, to Patentex, Inc. Process of preparing nylon yarn. 2,772,191, 11–27–56, Cl. 57—157.

Burleson, Robert N. Radius grinding fixture. 2,771,723, 11–27–56, Cl. 51—225.

Burness, Donald M., to Eastman Kodak Co. Process of manufacturing esters of 3-substituted 2-furoic acids. 2,772,295, 11–27–56, Cl. 260—347.5.

Burnett, Jesse W.: *See*—
Runaldue, Lewis R., and Burnett. 2,772,395.

Burney, Welton R., Jr.: *See*—
Simon, Eli, Thomas, and Burney. 2,772,245.

Busch, Floyd H., and D. A. Quaglieri, to General Electric Co. Seal for a meter housing. 2,772,109, 11–27–56, Cl. 292—307.

Buschkämper, Gustav. Box for the storage of sewing needles. 2,771,990, 11–27–56, Cl. 206—56.

Bushnell, James D., and R. L. Berg, to Esso Research and Engineering Co. Feed stock for naphtha reforming. 2,772,220, 11–27–56, Cl. 196—50.

Business Systems, Inc.: *See*—
Federwitz, Theodore A. 2,771,838.

Busque, Charles S. Land clearing implement. 2,771,693, 11–27–56, Cl. 37—2.

Washburn, Harold W. 2,772,364.

Continental Motors Corp.: *See*—
Altman, Peter, and Bakke. 2,771,862.

Cook, Leslie J., and L. T. Quaglia, to Chromatic Television Laboratories, Inc. Grid structure for cathode-ray tubes designed for polychrome image reproduction. 2,772,376, 11–27–56, Cl. 313—78.

Coonradt, Harry L., and W. K. Leaman, to Socony Mobil Oil Co., Inc. Method for reducing fracturing of ion-exchange resins. 2,772,236, 11–27–56, Cl. 210—24.

Cooper, Carl M., 40% to S. Fishfader. Boom angle indicator for cranes. 2,772,411, 11–27–56, Cl. 340—282.

Cooper, Joseph. Slide assembly for slide leaf extension tables. 2,772,131, 11–27–56, Cl. 311—55.

Cope, Arthur C.: *See*—
Campbell, Hugh C., and Cope. 2,772,314.

Cornelius, Richard T. Spraying devices. 2,772,118, 11–27–56, Cl. 299—88.

Cotchett, Louis M. Top roll for spinning and roving frames. 2,771,640, 11–27–56, Cl. 19—142.

Cousins, Edward, and F. A. Jeffries, to The Goodyear Tire & Rubber Co. Air curing coating composition and method of preparing same. 2,772,249, 11–27–56, Cl. 260—31.2.

Cox, Joseph B. Chain saws. 2,771,919, 11–27–56, Cl. 143—135.

Crabtree, Harold L., to Anchor Hocking Glass Corp. Method and device for manufacturing closure caps and closure cap produced thereby. 2,772,012, 11–27–56, Cl. 215—40.

Crane, Carlton L.: *See*—
Malm, Carl J., and Crane. 2,772,267.

Crews, Lowell T.: *See*—
Kalinowski, Mathew L., and Crews. 2,772,179.

Cribbs, Francis J. and T. J. Mechanical pencil having a push button, step by step feed. 2,771,858, 11–27–56, Cl. 120—17.

Cribbs, Thomas J.: *See*—
Cribbs, Francis J. and T. J. 2,771,858.

Crocker, H. S., Co., Inc.: *See*—
Cronenwett, Fred M. 2,771,854.

Cronenwett, Fred M., to H. S. Crocker Co., Inc. Dairy order indicator. 2,771,854, 11–27–56, Cl. 116—133.

Crossfield Products Corp.: *See*—
Patch, Harold K., and Grundy. 2,771,824.

Crowley, George C., to General Electric Co. Heating device control circuit. 2,772,338, 11–27–56, Cl. 219—20.

Crum, Harvey E. Swimming appliance. 2,771,618, 11–27–56, Cl. 9—21.

Cummings, Ross, to the United States of America as represented by the United States Atomic Energy Commission. Process of reclaiming uranium from solutions. 2,772,142, 11–27–56, Cl. 23—14.5.

Cupp, James E. Engineer's scale. 2,771,679, 11–27–56, Cl. 33—107.

Curran, Mary: *See*—
Marshall, Harry B., and Curran. 2,772,139.

Curry, John J. Dental matrix device. 2,771,677, 11–27–56, Cl. 32—63.

Cusic, John W., to G. D. Searle & Co. Basic esters of N-aryl-N-(heterocyclylalkyl) carbamic acids and syntheses thereof. 2,772,276, 11–27–56, Cl. 260—302.

Cusic, John W., to G. D. Searle & Co. Basic esters of N-aralkyl-N-cycloalkylcarbamic acids and the production thereof. 2,772,287, 11–27–56, Cl. 260—326.3.

Cusic, John W., to G. D. Searle & Co. Basic esters of N-aryl and N-cycloalkyl indancarbamic acids, their salts and methods for their preparation. 2,772,288, 11-27-56, Cl. 260—326.3.

Cusic, John W., to G. D. Searle & Co. Basic esters of N-aralkyl-N-arylcarbamic acids and the manufacture thereof. 2,772,289, 11-27-56, Cl. 260—326.3.

Czys, Albert, to Dorbin Metal Strip Mfg. Co., Inc. Anchor for resilient window strips. 2,771,642, 11-27-56, Cl. 20—12.

Dale, Glenn H.: *See*—
Stalder, William L., and Dale. 2,772,269.

D'Amico, John J., to Monsanto Chemical Co. Thiazolylmercaptoalkanediones. 2,772,277, 11-27-56, Cl. 260—306.

Darby, Walter, to Stuart Davis Ltd. Reciprocatory drive for a rack. 2,771,782, 11-27-56, Cl. 74—32.

Davey, George M., to Hadco Engineering Co., Inc. Axial disc brake. 2,771,966, 11-27-56, Cl. 188—72.

Davis, Fred: *See*—
Carls, Darl F., and Davis. 2,771,864.

Malcolm, Harold O., and Hagerbaumer. 2,772,123.
Hall, Dick S., to Phillips Petroleum Co. Pebble heat exchanger. 2,772,122, 11–27–56, Cl. 302—53.
Hall, Lloyd A., to The Griffith Laboratories, Inc. Antioxidant material and use of said material in treating meat. 2,772,169, 11–27–56, Cl. 99—159.
Hall, Lloyd A., to The Griffith Laboratories, Inc. Antioxidant composition. 2,772,170, 11–27–56, Cl. 99—163.
Halliday, Donald D. and E. P. Hot air baseboard diffuser. 2,771,833, 11–27–56, Cl. 98—40.
Halliday, Edward P.: *See*—
Halliday, Donald D. and E. P. 2,771,833.
Hammer, Samuel, to United Metal Box Co., Inc. Recessed handle for drawers, doors, and the like. 2,771,627, 11–27–56, Cl. 16—124.
Hamontre, Hugh C., F. G. Mueller, and F. E. Armstrong, Instrument to measure the diameter of subsurface well bores. 2,771,686, 11–27–56, Cl. 33—178.
Handling Equipment & Mfg. Co.: *See*—
Bowen, Max E., Hanish, and Carlson. 2,772,344.
Hanish, Joseph A.: *See*—
Bowen, Max E., Hanish, and Carlson. 2,772,344.
Hannay, Robert S. E., and W. Kilby, to Standfast Dyers and Printers Ltd. Dyeing of textile materials using molten metal. 2,772,136, 11–27–56, Cl. 8—1.
Hansen, Fred C., Sr. Golfing aids. 2,771,678, 11–27–56, Cl. 33—46.
Hansen, John E., and T. J. Dietz, to the United States of America as represented by the Secretary of Agriculture. Vulcanization of acrylic acid copolymers. 2,772,251, 11–27–56, Cl. 260—79.5.
Hanson, Alfred H., to The Fairbanks Co. Appliance hand truck provided with stair-climbing attachment. 2,772,006, 11–27–56, Cl. 280—5.24.
Hanson, Walter J.: *See*—
Owen, Edwin H., and Hanson. 2,771,726.
Hansson, Karl G. L.: *See*—
Strömberg, Tage A., and Hansson. 2,771,684.
Hardman, Albert F., to The Goodyear Tire & Rubber Co. Manufacture of sulfenamides. 2,772,278, 11–27–56, Cl. 260—306.6.
Harkey, George D., Jr., and C. E. Hawk, to Aerojet-General Corp. Fluid delivery device. 2,771,915, 11–27–56, Cl. 141—116.
Harper, George C., and C. T. Wilson. Frog net. 2,771,701, 11–27–56, Cl. 43—7.
Harper, James M.: *See*—
Ardissone, Joseph R., and Harper. 2,771,856.
Harpfer, Donald E., and A. F. Geisinger, to The Goodyear Tire & Rubber Co. Reel. 2,772,056, 11–27–56, Cl. 242—96.
Harrington, Donald F.: *See*—
Bauman, William C., and Harrington. 2,772,237.
Harrington, Lawrence E., ½ to W. W. Bullock. Collapsible tube squeezer. 2,772,026, 11–27–56, Cl. 222—82.
Harris, Arthur A. Tenpins. 2,772,091, 11–27–56, Cl. 273—82.
Hartford National Bank and Trust Co.: *See*—
Haayman, Pieter W., van der Linden, Veeneman, and Janssen. 2,772,190.
Hiller, Everett O. 2,771,630.
Hiller, Everett O. 2,771,631.
Jonkers, Cornelius O., Kohler, Liebe, and van der Ster. 2,771,751.
Mollers, Josef, and Seidel. 2,772,186.
Harwin, C. W., Inc.: *See*—
Roseland, Harold A. 2,772,031.
Harwood, Kenneth J.: *See*—
Rogers, Sedgwick C., and Harwood. 2,772,181.
Haven, Allan M., to The American Oil Co. Catalyst sampling system. 2,771,776, 11–27–56, Cl. 73—421.

Hawk, Carson E.: *See*—
Harkey, George D., Jr., and Hawk. 2,771,915.
Hawkes, Arthur S., and D. O. Remter, to Ethyl Corp. Treatment of hydrocarbon stocks with sodium. 2,772,211, 11–27–56, Cl. 196—26.
Heald Machine Co., The: *See*—
Schmidt, William D., and Blood. 2,771,714.
Hemminger, Charles E., to Esso Research and Engineering Co. Hydrocarbon oil conversion process. 2,772,215, 11–27–56, Cl. 196—49.
Hemstreet, Albert B. Locking means for centrifugal molds. 2,771,647, 11–27–56, Cl. 22—113.5.
Hendrick, Walter T. S., to J. Lyons & Co. Ltd. Cartons. 2,772,042, 11–27–56, Cl. 229—41.
Henle, Robert A.: *See*—
Logue, Joseph C., and Henle. 2,772,410.
Henneesy, Robert E., to Ford Motor Co. Adjustable attachment means for a motor vehicle fabric top. 2,772,114, 11–27–56, Cl. 296—107.
Henney Motor Co., Inc.: *See*—
Wiser, Hubert J., Sr. 2,771,943.
Henry, Robert L., Jr., to the United States of America as represented by the Secretary of the Navy. Method of making modular electronic assemblies. 2,771,663, 11–27–56, Cl. 29—155.5.
Henry Valve Co., Inc.: *See*—
Jones, Evan. 2,772,019.
Hepher, Martin, to Eastman Kodak Co. Light-detached resists or reliefs for printing plates. 2,772,160, 11–27–56, Cl. 96—35.
Hercules Powder Co.: *See*—
Evans, Forest B. 2,772,138.
Herele, Ludwig, and F. Ihla, to Farbwerke Hoechst Aktiengesellschaft vormals Meister Lucius & Bruning. Winding device. 2,772,054, 11–27–56, Cl. 242—18.
Herschensohn, Arthur M. Hair nets. 2,771,888, 11–27–56, Cl. 132—49.
Herter, George L. Quick detachable gun sling swivel. 2,771,999, 11–27–56, Cl. 42—85.
Heth, Sherman C., N. R. Krause, and H. E. Wiltsey, to J. I. Case Co. Picking rolls with clearing beater. 2,771,731, 11–27–56, Cl. 56—104.
Hibshman, Henry J., and J. J. Trexel, to Esso Research and Engineering Co. Vapor-liquid contacting apparatus. 2,772,081, 11–27–56, Cl. 261—114.
Hickey, John H., and L. M. Mittelsdorf, to the United States of America as represented by the Secretary of the Navy. Variable-speed code-training devices. 2,772,326, 11–27–56, Cl. 178—115.
Hickson, Glenn R.: *See*—
Frick, Charles H., and Hickson. 2,771,778.
Hidde Nijland, Hendrick A., to N. V. "Coq." Circuit breakers. 2,772,335, 11–27–56, Cl. 200—148.
Hiestand, Everett N., to the United States of America as represented by the Secretary of the Navy. Radioactive source holder. 2,772,361, 11–27–56, Cl. 250—106.
Higgins, Roger K., to the United States of America as represented by the Secretary of the Navy. Sensitive pressure switch. 2,772,330, 11–27–56, Cl. 200—83.

Wellman, S. K., Co., The: *See*—
Wellman, Samuel K. 2,771,801.

Wellman, Samuel K., to The S. K. Wellman Co. Apparatus for shaping bimetallic articles. 2,771,801, 11–27–56, Cl. 80—56.

Wendt, Karl R. Separating equipment. 2,771,993, 11–27–56, Cl. 209—172.

West, James R., and F. Gormley, to Texas Gulf Sulphur Co. Roasting pyrites. 2,772,153, 11–27–56, Cl. 75—9.

Westinghouse Electric Corp.: *See*—
Ardissone, Joseph R., and Harper. 2,771,856.
Arnott, Edward G. F., and Atkinson. 2,771,765.
Dunlap, Charles M. 2,771,766.
Mullan, Daniel. 2,772,134.
Parducci, Ralph R., and Brenneck. 2,771,980.
Quaely, Martin F., and Lilliendahl. 2,772,227.
Thorp, Arthur G., II. 2,771,622.

Wheeler, Keith W., J. K. Seyler, and M. G. Van Campen, Jr., to The Wm. S. Merrell Co. Spiro cycloalkane-thiazaneones. 2,772,268, 11–27–56, Cl. 260—243.

Wheelon, Orville A., to Douglas Aircraft Co., Inc. High-pressure hydraulic press. 2,771,850, 11–27–56, Cl. 113—44.

Whirlpool-Seeger Corp.: *See*—
Prosek, John R., and Palmer. 2,771,748.

White, Philip R., to General Motors Corp. Shell molding. 2,771,850, 11–27–56, Cl. 22—193.

White, William E., and J. R. Clark, to said J. R. Clark and T. Somerville, III, trustee. Divided pallet brick package. 2,771,989, 11–27–56, Cl. 206—65.

Whitney, Maurice P., to Bendix Aviation Corp. Engine cooling fan drive gearing. 2,771,792, 11–27–56, Cl. 74—752.

Wilder, Edward A., to S. C. Johnson & Son, Inc. Improving gel strength of vegetable waxes. 2,772,301, 11–27–56, Cl. 260—404.8.

Williams, Frederic C.: *See*—
Robinson, Arthur A., Williams, and Kilburn. 2,772,050.

Williams, Richard D.: *See*—
Armstrong, John W., Spears, and Williams. 2,771,669.

Willis, George H. Rubber dental cushion having lubricant coating. 2,771,675, 11–27–56, Cl. 32—2.

Willsey, Charles H. Egg cracking mechanism. 2,771,926, 11–27–56, Cl. 146—2.

Wilson, Carl T.: *See*—
Harper, George C., and Wilson. 2,771,701.

Wilson & Co., Inc.: *See*—
Gaarder, Herbert M. 2,772,195.

Wilson, Harry A., to The A & W Machine Co. Extension for exhaust pipes. 2,771,908, 11–27–56, Cl. 138—46.5.

Wilson, Kermit H. Table-bench having means for controlling and guiding the folding thereof into folding position. 2,771,937, 11–27–56, Cl. 155—124.

Wilson, Peter H. Time control valve. 2,772,067, 11–27–56, Cl. 251—240.

Wilson, Thomas A., H. F. Parker, R. J. Kieffer, and R. T. Gillette, to Columbus McKinnon Chain Corp. Method of welding the ends of a chain link wherein initial point contact is obtained between the ends. 2,771,735, 11–27–56, Cl. 59—35.

Wiltsey, Howard E.: *See*—
Heth, Sherman C., Krause, and Wiltsey. 2,771,731.

Winchester, Charles P., deceased, by D. Winchester, administratrix. Insert pump cage having reciprocable valve. 2,771,902, 11–27–56, Cl. 137—332.

Winchester, Dollie: *See*—
Winchester, Charles P. 2,771,902.

Winkler, Gilbert. Dishes or plates. 2,771,754, 11–27–56, Cl. 63—15.

Winona Tool Mfg. Co.: *See*—
Fuglie, Elmer A. 2,771,719.

Wirsig, Leo H. Double duty disk harrow. 2,771,729, 11–27–56, Cl. 55—81.

Wiser, Hubert J., Sr., to Henney Motor Co., Inc. Oil burner. 2,771,943, 11–27–56, Cl. 158—36.3.

Wismer, Kenneth R.: *See*—
Hollabaugh, Max G., Sher, and Wismer. 2,772,135.

Witt, Harry S., and F. S. Martin, to United States Rubber Co. Microporous vinyl chloride resin and method of making same. 2,772,322, 11–27–56, Cl. 136—146.

Wittrup, Janus B. Shower curtain. 2,771,945, 11–27–56, Cl. 160—124.

Wobbe, Delbert E., and F. J. Stasewich, to American Can Co. Soldering flux. 2,772,192, 11–27–56, Cl. 148—23.

Wolfe, Dexter L., and L. W. Hoel, to Kimberly-Clark Corp. Paper coating. 2,772,184, 11–27–56, Cl. 117—84.

Wood, Wallace H., to Norton Co. Grinding machine. 2,771,715, 11–27–56, Cl. 51—95.

Woodruff, Albert E., to Automatic Electric Laboratories, Inc. Volume limiter device. 2,772,390, 11–27–56, Cl. 323—66.

Wyse, Harold G. Wiper rings. 2,772,105, 11–27–56, Cl. 288—14.

Yeager, Charles C., to Scientific Oil Compounding Co., Inc. Fungicidal composition. 2,772,260, 11–27–56, Cl. 260—102.

Yeager, Charles C., to Scientific Oil Compounding Co., Inc. Fungicidal composition. 2,772,261, 11–27–56, Cl. 260—102.

Yeager, Charles C., to Scientific Oil Compounding Co., Inc. Fungicidal compositions. 2,772,262, 11–27–56, Cl. 260—102.

Yeager, Charles C., to Scientific Oil Compounding Co., Inc. Fungicidal composition. 2,772,263, 11–27–56, Cl. 260—102.

Yeager, Charles C., to Scientific Oil Compounding Co., Inc. Fungicidal composition. 2,772,264, 11–27–56, Cl. 260—102.

Yellott, John I., and F. D. Buckley, to Bituminous Coal Research, Inc. Recycling, pressurized vortical whirl separator, concentrator and ash storage system for powdered coal-burning gas turbine power plants. 2,771,962, 11–27–56, Cl. 183—34.

Young, Homer W.: *See*—
Morse, Charles H., and Young. 2,771,819.

Youngberg, Walter, to The H. B. Ives Co. Latch mechanism. 2,772,107, 11–27–56, Cl. 292—108.

Yuska, Henry: *See*—
Lieberman, Emanuel R., and Yuska. 2,772,248.

Zakheim, Murray, to The Pennsylvania Salt Mfg. Co. Composition comprising copper salts of fluorine and arsenic and fibrous materials containing same. 2,772,199, 11–27–56, Cl. 167—38.5.

Zakheim, Murray, to The Pennsylvania Salt Mfg. Co. Composition containing copper salts of fluorine and arsenic for protecting wood and other fibrous materials. 2,772,200, 11–27–56, Cl. 167—38.5.

Zeabari, George J. Automobile trunk extension. 2,772,041, 11–27–56, Cl. 224—42.44.

Zeiss, Carl: *See*—
Sonnberger, Heinrich. 2,772,047.

Zelov, Victor I. Window closure. 2,771,643, 11–27–56, Cl. 20—40.

Ziska, Adam. Ring cutting machine. 2,771,662, 11–27–56, Cl. 29—70.

# CLASSIFICATION OF PATENTS

## ISSUED NOVEMBER 27, 1956

NOTE.—First number—class, second number—subclass, third number—patent number

| | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| 1— | 13: 2,771,608 | 33— | 178: 2,771,687 | 73— | 55: 2,771,770 | 102— | 22: 2,771,841 | 137— | 622: 2,771,907 | 192— | 85: 2,771,976 |

The TRADEMARK SECTION of the OFFICIAL GAZETTE, issued weekly, is mailed under the direction of the Superintendent of Documents, Government Printing Office, Washington 25, D. C., to whom all subscriptions should be made payable and all communications addressed; subscription price, $10.50 per annum, foreign mailing $2.00 additional; single copies, 20 cents each.

under the provisions of section 42, Trade-Mark Act of 1946, and section 11.16, Customs Regulations:

"PINKING SHEARS CORPORATION," owned by Pinking Shears Corporation, a corporation organized under the laws of the State of New York, having its principal place of business at 102 Prince Street, New York 12, New York, which trade name is used in connection with pinking shears (metal scissors with teeth for cutting serrated edges in cloth or other sheet material).

Any person who desires to file an opposition to the recordation of this trade name shall notify the Commissioner of Customs, Bureau of Customs, Washington 25, D. C., before the expiration of 30 days after November 9, 1956, of his intent to oppose the recordation. If a notice of opposition is filed, the opposer will be furnished with a copy of the application for recordation of the trade name, together with its supporting documents and instructions as to the procedure to be followed. The customs officers concerned will be given notice within 45 days after November 9, 1956, of any opposition proceeding.

Until 45 days after November 9, 1956, all articles of foreign manufacture bearing names or marks which copy or simulate the above-mentioned trade name shall be detained, but not seized, and thereafter, shall receive the treatment provided for in section 11.17, Customs Regulations, unless a notice is received that an opposition has been filed, in which case such articles shall continue to be detained until a final determination is made concerning the right of the applicant to the trade name.

(Signed) D. B. STRUBINGER,
*Acting Commissioner of Customs.*

# MARKS PUBLISHED FOR OPPOSITION

**The following marks are published in compliance with section 12(a) of the Trademark Act of 1946. Notice of opposition under section 13 may be filed within thirty days of this publication. See Rules 20.1 to 20.5.**

**As provided by section 31 of said act, a fee of twenty-five dollars must accompany each notice of opposition.**

## CLASS 1

## RAW OR PARTLY PREPARED MATERIALS

SN 693,925. Mulford-Hicharens Peat Humus Corp., d. b. a. M & H Peat Humus Co., Apopka, Fla. Filed Aug. 30, 1955.

Mother Earth

For Prepared Soil for Growing Plants.
First use Aug. 22, 1955.

SN 695,509. Union Wadding Company, Pawtucket, R. I. Filed Sept. 28, 1955.

UNITEX

For Wadding Made of Fibers Which Are Bonded Together With a Resin.
First use Sept. 14, 1955.

SN 697,371. Agnes P. Hoke, Princeton, N. J. Filed Oct. 31, 1955.

18th CENTURY BOUQUET

For Dried Natural Flowers and Leaves.
First use July 7, 1955.

SN 698,390. The Wayside Gardens Co., Mentor, Ohio. Filed Nov. 16, 1955.

For Hardy Plants, Lilies, Imported and Native Garden Bulbs, Shrubs, Trees, Roses, Perennials, and Grass Seeds.
First use March 1924 on bulbs.

SN 699,394. General Mills, Inc., Minneapolis, Minn. Filed Dec. 5, 1955.

Soft Pak

For Cellulose Sponges.
First use Feb. 9, 1955.

SN 3,344. The Barnsdey-Cheney Company, Columbus, Ohio. Filed Feb. 27, 1956.

BLACK MAGIC

For Activated Charcoal in Granular or Comminuted Forms.
First use Oct. 28, 1955.

SN 3,529. Gering Products, Inc., Kenilworth, N. J. Filed Feb. 28, 1956.

GER-LITE

For Plastic Sheet Material.
First use November 1954.

SN 4,004. Joseph Davis Plastics Co., Arlington, N. J. Filed Mar. 7, 1956.

JODA

Owner of Reg. No. 501,444.
For Thermoplastic Sheets, Rods, Tubes, and Films.
First use Jan. 15, 1950.

SN 7,543. Texon, Inc., South Hadley Falls, Mass. Filed May 2, 1956.

Dutek

The drawing is lined for red.
For Impregnated Fibre Materials Sold in Sheets, Boards, and Rolls for Making Inner Soles and Similar Products for the Shoe and Slipper Trade and a Variety of Other Impregnated Fibre Products in Other Trades, for Example, Luggage, Tags, Cap Visors, Gaskets, Insulating Materials, Chair Seats, Anti-Squeak Liners, and the Like.
First use July 1955.

SN 8,291. UBC Distributors, Incorporated, Chicago, Ill. Filed May 14, 1956.

DEERWOOD PARK

For Grass Seed.
First use Mar. 14, 1956.

SN 8,677. Marble Products Company of Georgia, Atlanta, Ga. Filed May 21, 1956.

Snow White

For Chips or Flakes of Marble Used in the Manufacture of Roofing.
First use Apr. 4, 1955.

SN 8,929. Cornell Seed Company, St. Louis, Mo. Filed May 24, 1956.

**LIFEGARD**

For Field, Vegetable, Flower, and Grass Seeds.
First use Feb. 10, 1956.

SN 9,015. Armour and Company, Chicago, Ill. Filed May 25, 1956.

**WESTOVER**

For Sole Leather.
First use Aug. 12, 1954.

SN 9,016. Armour and Company, Chicago, Ill. Filed May 25, 1956.

**RICHWOOD**

For Sole Leather.
First use Jan. 13, 1955.

SN 9,017. Armour and Company, Chicago, Ill. Filed May 25, 1956.

**FLEX**

For Upper and Sole Leather.
First use Jan. 13, 1956.

SN 9,197. Technion Design & Manufacturing Co., Inc., New York, N. Y. Filed May 28, 1956.

**SUR-BRAZE**

For Castable Ceramic Material From Which Jigs and Fixtures Are Made for Brazing, Soldering, and Sintering.
First use March 1952.

SN 9,484. George F. Pettinos, Inc., Philadelphia, Pa. Filed June 1, 1956.

**SANTROL**

For Sand Additives for Foundry Use.
First use Mar. 28, 1955.

SN 9,485. George F. Pettinos, Inc., Philadelphia, Pa. Filed June 1, 1956.

**SEAFLOUR**

For Sand Additives for Foundry Use.
First use May 22, 1956.

SN 9,612. The United States Graphite Company Division of The Wickes Corporation, Saginaw, Mich. Filed June 4, 1956.

**SIPAC**

For Non-Carbonaceous Foundry Facing.
First use Aug. 5, 1955.

SN 9,704. Emerson & Cuming, Inc., Canton, Mass. Filed June 6, 1956.

**ECCOFOAM**

For Plastic Foam for Use in Laminated Structures.
First use July 1954.

SN 9,708. Evergreen Hatchery Incorporated, Dysart, Iowa. Filed June 6, 1956.

**NUKROS**

For Live Chickens.
First use Apr. 2, 1956.

SN 9,788. W. R. Grace & Co., New York, N. Y. Filed June 7, 1956.

**GRAKON**

For Solid Polyethylene for General Industrial Use.
First use Mar. 2, 1956.

SN 9,789. W. R. Grace & Co., New York, N. Y. Filed June 7, 1956.

**GRACENE**

For Solid Polyethylene for General Industrial Use.
First use Mar. 2, 1956.

SN 9,790. W. R. Grace & Co., New York, N. Y. Filed June 7, 1956.

**GRACINE**

For Solid Polyethylene for General Industrial Use.
First use Mar. 2, 1956.

SN 9,791. W. R. Grace & Co., New York, N. Y. Filed June 7, 1956.

**GRACON**

For Solid Polyethylene for General Industrial Use.
First use Mar. 2, 1956.

SN 9,792. W. R. Grace & Co., New York, N. Y. Filed June 7, 1956.

**GREX**

For Solid Polyethylene for General Industrial Use.
First use Mar. 2, 1956.

SN 9,910. Western Chef Products, Inc., Spokane, Wash. Filed June 8, 1956.

*Western Chef*

Owner of Reg. No. 599,532.
For Compressed Sawdust Barbecue Briquettes Fuel.
First use Jan. 23, 1953.

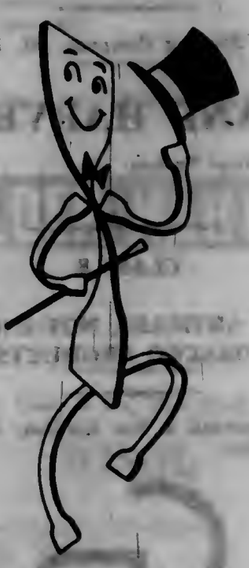
SN 10,049. Garfield Williamson, Inc., Jersey City, N. J. Filed June 11, 1956.

**SHUR-TURF**

For Grass Seed.
First use June 6, 1955.

SN 10,162. W. R. Grace & Co., New York, N. Y. Filed June 13, 1956.

**GRACITE**



For Solid Polyethylene for General Industrial Use.
First use May 9, 1956.

SN 10,312. Foams, Inc., Port Washington, Wis. Filed June 15, 1956.

TRIM FOAM

For Polyurithane Resin Foam Products Used for Padding and as a Cushioning Material in Furniture, Bedding, and Automotive Seating, for Gaskets and as an Insulation Material.
First use Feb. 21, 1956.

SN 10,477. Phillips Petroleum Company, Bartlesville, Okla. Filed June 18, 1956.

For Rubber Masterbatch.
First use May 21, 1956.

SN 12,763. The Ross Seed Company, Wichita, Kans. Filed July 16, 1956.

ACORN BRAND SEEDS

Owner of Reg. No. 241,732.
For Seeds—Namely, Grass, Flower, Garden, and Field Seeds.
First use on or about Feb. 1, 1914.

CLASS 3

**BAGGAGE, ANIMAL EQUIPMENTS, PORTFOLIOS, AND POCKETBOOKS**

SN 9,900. Schell Leather Goods Co., Inc., Cincinnati, Ohio. Filed June 8, 1956. Sec. 2(f).

**SNAPAK**

Owner of Reg. No. 434,533.
For Luggage and Carrying Cases—Namely, Brief Cases, Traveling Bags, and Suitcases.
First use on or about Jan. 1, 1935.

SN 10,592. Gralnick and Sons Inc., Philadelphia, Pa. Filed June 20, 1956.

**STYLITE**

For Overnight Cases, Wardrobes, Pullmans, Hat and Shoe Cases, Train Cases, Fortnighters, Two-Suiters, Zipper Bags, and Overseas Bags.
First use Jan. 16, 1940.

CLASS 4

**ABRASIVES AND POLISHING MATERIALS**

SN 6,630. Penray Company, Chicago, Ill. Filed Apr. 18, 1956.

PENRAY

Owner of Reg. No. 605,289.
For Automobile Wax, Automobile Polish and Cleaner, Chrome Cleaner and Automobile Paint Rubbing Compound Used Also as a Pre-Wax Cleaner.
First use Mar. 3, 1953.

SN 8,719. Solvolene Lubricants Limited, London, England. Filed May 21, 1956.

**AUTOSOL**

Owner of British Reg. No. 734,426, dated Sept. 24, 1954.
For Cleaning and Polishing Preparations.

CLASS 6

**CHEMICALS AND CHEMICAL COMPOSITIONS**

SN 676,896. Kem-I-Kal Engineering Laboratories, Inc., Centralia, Ill. Filed Nov. 18, 1954. Sec. 2(f).

**KEM-I-KAL**

For Paraffin Solvents Water-Treating Agents, Sewer Tree Root Exterminators, and Anti-Freeze Agents.
First use 1938.

SN 696,413. Esquire Chemical Co., Downers Grove, Ill. Filed Nov. 17, 1955.

## BALL O' PERFUME

For Deodorant and Moth Crystals.
First use Sept. 19, 1955.

SN 699,053. Arkansas Company, Inc., Newark, N. J. Filed Nov. 29, 1955.

## DERGON

Owner of Reg. No. 402,025.
For Nitrogenous Fatty Esters and Sulfonated Fatty Esters for Use as Textile Assistants.
First use March 1940.

SN 3,502. Andrew Wilson, Inc., Springfield, N. J. Filed Feb. 27, 1956.

For Insecticides.
First use in April 1921.

SN 3,568. American Cyanamid Company, New York, N. Y. Filed Feb. 29, 1956.

## CYANATEX

Owner of Reg. Nos. 589,766, 602,013, and 609,290.
For Lubricant, Softener, and Rewetting Agent Used in Finishing Cotton Fabrics; and a Wetting Agent.
First use Dec. 21, 1954.

SN 5,168. Church & Dwight Co., Inc., Syracuse, N. Y. Filed Mar. 26, 1956.

## CON-SAL

For Sal Soda, Washing Soda, Especially in Concentrated or Dehydrated Form.
First use Jan. 13, 1956.

SN 6,980. Crosby Chemicals, Inc., De Ridder, La. Filed Apr. 24, 1956.

## ALCROYD

For Oil Modified Alkyd Resins.
First use on or about Mar. 22, 1956.

SN 7,126. Swift & Company, Chicago, Ill. Filed Apr. 25, 1956.

## ESTERFLEX

For Primary Plasticiser.
First use June 14, 1955.

SN 7,210. Milk Plant Specialties Corporation, Rochester, N. Y. Filed Apr. 26, 1956.

## I-ODO-FOR

For Sanitising Preparation for Sanitising Milk and Other Food Utensils and Equipment.
First use Mar. 2, 1956.

SN 7,298. R. T. Vanderbilt Company, Inc., New York, N. Y. Filed Apr. 27, 1956.

## VANOX

For Anti-Tarnish Agent for Use in Synthetic Dishwashing Detergents.
First use Apr. 3, 1956.

SN 7,490. Diamond Alkali Company, Cleveland, Ohio. Filed May 2, 1956.

## DIAMID

For Dissolving Agent for Milkstone in Dairy Processing Equipment.
First use Mar. 9, 1956.

### CLASS 7

### CORDAGE

SN 7,846. Ponit Trading Company, St. Louis, Mo. Filed May 7, 1956.

## GRAND HARVEST

For Binder and Baler Twines.
First use Sept. 10, 1955.

### CLASS 8

### SMOKERS' ARTICLES, NOT INCLUDING TOBACCO PRODUCTS

SN 4,771. F. Charatan & Son Limited, London, England. Filed Mar. 19, 1956.

For Smokers' Pipes.
First use January 1926.

### CLASS 9

### EXPLOSIVES, FIREARMS, EQUIPMENTS, AND PROJECTILES

SN 7,743. Benjamin Air Rifle Company, St. Louis, Mo. Filed May 7, 1956.

## BENJAMIN FRANKLIN

For Air Rifles, Air Pistols, Carbon Dioxide Rifles, and Carbon Dioxide Pistols.
First use Apr. 27, 1934, on air rifles and air pistols.

### CLASS 10

### FERTILIZERS

SN 700,938. Gordon Callbeck, d. b. a. A & A Coal Company, Denver, Colo. Filed Nov. 17, 1955.

For Fertilizers.
First use Aug. 4, 1947.

SN 4,197. Hale Laboratories, Bay City, Tex. Filed Mar. 9, 1956.

## MA-DER-GRO

For Fertiliser Comprising Peat Moss Treated With a Synthetic Liquid Chemical Fertiliser Containing Trace Elements, and the Liquid Chemical Fertiliser Per Se.
First use November 1955.

SN 7,526. The Ohio Equity Exchange Company, Lima, Ohio. Filed May 2, 1956.

## GOLDEN HARVEST

For Fertilizers.
First use Feb. 1, 1956.

SN 8,662. W. R. Grace & Co., New York, N. Y. Filed May 21, 1956.

## NISOL

For Nitrogen Solutions for Fertilizer.
First use Aug. 31, 1955.

SN 8,810. Washington Organic Fertilizers, Inc., Wapato, Wash. Filed May 22, 1956.

## FERT-O-STIK

For Fertilizer.
First use Mar. 20, 1956.

SN 11,616. Joseph Schumacher, Hallandale, Fla. Filed July 5, 1956.

For Plant Food.
First use May 10, 1956.

### CLASS 11

### INKS AND INKING MATERIALS

SN 683,993. Rochester Ribbon and Carbon Company, Inc., Rochester, N. Y. Filed Mar. 22, 1955.

## rolyzar

The drawing is lined for red and yellow but these colors are not claimed as part of the mark.
For Carbon Acetate Typewriter Ribbons Used on Typewriters Having Carbon Ribbon Attachments Therefor.
First use Dec. 28, 1953.

SN 8,596. Western Laboratories, Inc., Burbank, Calif. Filed May 18, 1956.

## POLENE

For Vehicle or Varnish for Printers' Inks.
First use Aug. 2, 1948.

### CLASS 12

### CONSTRUCTION MATERIALS

SN 689,724. International Minerals & Chemical Corporation, Chicago, Ill. Filed June 17, 1955.

## HY-TEMP REFRACTO

For Refractory Cement Containing Zirconium.
First use Aug. 10, 1954.

SN 698,095. U. S. Stone Corporation, Paterson, N. J. Filed Nov. 10, 1955.

## PURA-TEX STONE

No claim is made to the word "Stone."
For Cast Assimilated Stone for Interior and Exterior Construction.
First use on or about Aug. 15, 1955.

SN 699,981. Pennington Manufacturing Company, Addison, Ill. Filed Dec. 14, 1955.

## FIRE PLUG

For Dog Houses.
First use Dec. 5, 1938.

SN 2,779. Gladding, McBean & Company, Los Angeles, Calif. Filed Feb. 16, 1956.

## SATELLITE

For Floor and Wall Tile.
First use Oct. 19, 1955.

SN 3,601. Evans Products Company, Plymouth, Mich. Filed Feb. 29, 1956.

## EVANEER

For Plywood.
First use December 1940.

SN 4,020. The Flintkote Company, New York, N. Y. Filed Mar. 7, 1956.

**ORTAR**

For Liquid Coal Tar for Surface of Roadways.
First use on or about August 1953.

SN 4,272. Arteraft Awning Company, St. Louis, Mo. Filed Mar. 12, 1956.

**METAL ROLL**

For Metal Awnings.
First use August 1955.

SN 4,357. Productos Ceramicos, S. A., Monterrey, Nuevo Leon, Mexico. Filed Mar. 12, 1956.

The words "Marca Ind. Reg Monterrey Mexico" are disclaimed apart from the mark. Owner of Mexican Reg. No. 70,469, dated July 8, 1952.
For Ceramic Wall Tile.

SN 4,497. Water Seals, Inc., Chicago, Ill. Filed Mar. 13, 1956.

For Joint Seals—Namely, Waterstops of Plastic or Rubber-Like Material.
First use Mar. 1, 1953.

SN 4,739. Peterson Window Corporation, Ferndale, Mich. Filed Mar. 16, 1956. Sec. 2(f).

**PETERSON**

For Sash and Frame Window Construction.
First use Jan. 1, 1950.

SN 5,164. Central Commercial Company, Chicago, Ill. Filed Mar. 26, 1956.

Owner of Reg. No. 349,045.
For Crushed Slate, Slate Granules, Roofing Grit, Mineral Granules Both Natural and Artificially Colored, Crushed Mineral Aggregate, Roofing Granules, Slag Granules, Slate Flour, Roofing Fillers, Mineral Fillers, Roofing Talc, Roofing Mica, Mica Schist, Mineral Roofing Surfacing Granules, Ceramic Granules, Sheet Roofing, Shingles Coated With Mineral Granules, Crushed Marble, Marble Aggregates, Brick Cementatious and Composition Blocks, Tile, Brick Facings.
First use Nov. 28, 1910.

SN 5,473. Van-Packer Corporation, Bettendorf, Iowa. Filed Mar. 29, 1956.

**VP Van-Packer**

For Masonry Chimneys and Parts Thereof.
First use Sept. 1, 1947.

SN 7,081. Edilu Terrazo Designing Company, Chicago, Ill. Filed Apr. 25, 1956.

**SAVABRASS**

For Dividing Strips, Border Strips, and Expansion Joints for Floors and Walls.
First use Apr. 18, 1956.

**CLASS 13**

**HARDWARE AND PLUMBING AND STEAM-FITTING SUPPLIES**

SN 678,793. MacLean-Fogg Lock Nut Company, Chicago, Ill. Filed Dec. 22, 1954.

The mark consists of two annular segmental indentations formed in the top end of a nut, each segment being diametrically opposed to the other with respect to the axis of the nut and each segment being located immediately adjacent the threads thereof.
For Lock Nuts.
First use September 1948.

SN 692,910. Dalmine S. p. A., Milan, Italy. Filed Aug. 12, 1955.

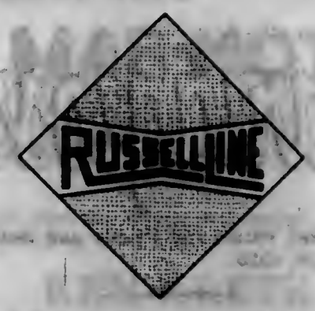
**RIVESTIMENTO DALMINE"**

The Italian words "Rivestimento Dalmine" mean "coating Dalmine" when translated into English. Owner of Italian Reg. No. 120,372, dated Jan. 18, 1955.
For Metallic Tubes.

SN 700,836. Ajax Hardware Manufacturing Corporation, Los Angeles, Calif. Filed Dec. 30, 1955.

**Town and Country**

For Cabinet Door and Drawer Pulls, Drawer Knobs, Back Plates, and Hinges.
First use Aug. 4, 1955.



SN 9,173. R. S. Precision Products, Floral Park, N. Y. Filed May 28, 1956.

**STA-KIT**

For Sprinkler Hose Anchors.
First use May 18, 1956.

SN 9,177. The Risdon Manufacturing Company, Naugatuck, Conn. Filed May 28, 1956.

For Chain of Various Types, Including Sash, Jack, Ball, Loop, and Sprocket Chain and Accessories; Also on Water Closet Screws, Screw Heads, Bolts, Nuts, Washers, Lift Wires, Float Rods, Refill Tubes, Overflow Tubes; Shower Curtain Hooks, Floor Flanges, Wire Rings, and Wire Pipe Hooks.
First use July 1954; in or about 1921 as to "Russell Line."

SN 9,309. United States Pipe and Foundry Company, Birmingham, Ala. Filed May 29, 1956.

**USP**

For Hollow Cast Metal Bodies—Namely, Cast Iron Pipes and Fittings Having Plain or Flanged Ends, and With or Without Bell and Spigot Ends.
First use Sept. 29, 1949.

SN 10,532. Grant Pulley & Hardware Corporation, Flushing, N. Y. Filed June 19, 1956.

**SLIDERITE**

For Drawer Slides.
First use June 14, 1956.

SN 10,803. Ridderstedt Manufacturing Corp., Batavia, Ill. Filed June 22, 1956.

**ADJUST-O-SHELF**

For Brackets for Shelving.
First use May 24, 1956.

**CLASS 15**

**OILS AND GREASES**

SN 676,053. Haller Engineering & Manufacturing, Anoka, Minn. Filed Nov. 4, 1954. Sec. 2(f).

**XLENT**

For Lubricating Oil With Cleaning Properties for Use on Firearms, Delicate Machinery, Typewriters, and the Like.
First use on or about Jan. 1, 1927.

SN 7,856. Harold B. Sherfy, d. b. a. Sherfy's Ltd., Seattle, Wash. Filed May 7, 1956.

**DECORATOR**

For Candles.
First use July 17, 1955.

SN 9,264. Gulf Oil Corporation, Pittsburgh, Pa. Filed May 29, 1956.

**GULFCUT**

For Cutting Oils.
First use Jan. 1, 1956.

SN 11,447. Standard Oil Company of California, San Francisco, Calif. Filed July 13, 1956.

Owner of Reg. Nos. 356,109, 533,798, and others.
For Petroleum Waxes and Petrolatums, Kerosenes, Fuel and Heating Oils; Internal Combustion Engine Fuels; Oils Useful for Preventing the Adherence of Molding Forms to Cement, Brick, and Other Materials; Oils Useful for Extracting Natural Gasoline From Natural Gas or Vapors, and for Protecting Mains, Meters, and Other Internal Parts of Gas Distribution Systems; Quenching Oils Useful as Coolants in the Heat Treatment of Steel; Refined Oils Used as Compass Fluids; Lubricating Oils and Greases.
First use February 1956 on motor oil.

SN 13,281. Esso Standard Oil Company, New York, N. Y. Filed Aug. 2, 1956.

**MARNOL**

For Marine Motor Fuels.
First use June 29, 1956.

SN 13 332. Devolube Corporation of America, Los Angeles, Calif., to Ernest F. Savage, Los Angeles, Calif. Filed Aug. 28, 1956.

**DEV-O-LUBE**

For Preparation for Adding to Motor Oil for Increasing the Viscosity Index Thereof.
First use on or about Sept. 1, 1953.

SN 13 389. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**NAUTILUS**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13 390. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**NASSA**

For Lubricating Oil.
First use Feb. 1, 1948.

SN 13 391. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**OMALA**

For Lubricating Oil.
First use Mar. 20, 1948.

SN 13,392. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**BOLMA**

For Lubricating Oil.
First use June 10, 1948.

SN 13,393. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ALVANIA**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,394. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINA**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,395. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOL**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,396. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLA**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,397. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINE**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,398. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINA**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,399. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINE**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,400. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINA**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,401. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINE**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,402. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINA**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,403. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINE**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,404. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINA**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,405. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINE**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,406. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINA**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,407. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINE**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,408. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINA**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,409. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINE**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,410. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINA**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,411. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINE**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,412. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINA**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,413. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINE**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,414. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINA**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,415. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINE**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,416. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINA**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,417. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINE**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,418. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINA**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,419. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINE**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,420. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINA**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,421. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINE**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,422. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINA**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,423. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINE**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,424. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINA**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,425. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINE**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,426. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINA**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,427. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINE**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,428. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINA**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,429. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINE**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,430. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINA**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,431. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINE**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,432. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINA**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,433. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

**ARGINOLINE**

For Lubricating Oil.
First use Dec. 1, 1929.

SN 13,434. Shell Oil Company, New York, N. Y. Filed Aug. 3, 1956.

Owner of Swiss Reg. No. 156,001, dated Apr. 15, 1935.
For Prostate Gland Extract.

SN 2,323. S. J. Tutag & Company, Detroit, Mich. Filed Feb. 8, 1956.

## ASMINOREL

For Antiasthmatic Bronchodilator Preparation.
First use Sept. 15, 1953.

SN 2,937. Abbott Laboratories, North Chicago, Ill. Filed Feb. 20, 1956.

## ION-O-TRATE

Owner of Reg. No. 598,683.
For Vials Containing Mineral Salts, Alcohol, and Carbohydrate Solutions in Concentrated Aqueous Form for Use in Preparing Solutions for Parenteral Therapy and Transfusion.
First use Dec. 18, 1953.

SN 4,472. Pet Center Corporation, New York, N. Y. Filed Mar. 13, 1956.

## BIRD-A-VITE

For Therapeutic Vitamins for Birds.
First use Jan. 9, 1956.

SN 4,508. American Transpacific Corp., d. b. a. American Chemical & Drug Co., San Francisco, Calif. Filed Mar. 14, 1956.

## CHLORO-Z-MYCIN

For Antibiotic in Capsule Form for Oral Reception and in Powdered Form for Intravenous or Intramuscular Injection.
First use Feb. 14, 1956.

SN 4,588. S. J. Tutag & Company, Detroit, Mich. Filed Mar. 14, 1956.

## DIPHYLETS

For Anorectic Preparation for Use in Obesity.
First use February 1953.

SN 5,115. Merck & Co., Inc., Rahway, N. J. Filed Mar. 23, 1956.

## CO-DELTRA

Owner of Reg. Nos. 503,514 and 553,939.
For Hormonal Compound for Medicinal and Pharmaceutical Use.
First use Feb. 27, 1956.

SN 6,000. Gray Pharmaceutical Co., Inc., Newton, Mass. Filed Apr. 9, 1956.

## DIOVAC

For Pharmaceutical Preparation for the Correction of Constipation.
First use Mar. 5, 1956.

SN 6,446. Merck & Co., Inc., Rahway, N. J. Filed Apr. 16, 1956.

## OXAMYCIN

Owner of Reg. No. 426,310.
For Antibiotics.
First use Mar. 14, 1956.

SN 6,779. American Home Products Corporation, d. b. a. Wyeth Laboratories Division of American Home Products Corporation, New York, N. Y. Filed Apr. 20, 1956.

## LYTENSENE

For Pharmaceutical Preparations for Use as Ganglion Blocking Agents.
First use Apr. 13, 1956.

SN 7,050. Unilab, Inc., New York, N. Y. Filed Apr. 24, 1956.

## CYL-RE

For Suppositories To Counteract Rheumatism and Arthritis.
First use Mar. 1, 1956.

SN 7,100. McNeil Laboratories, Incorporated, Philadelphia, Pa. Filed Apr. 25, 1956.

## BUTISOL SODIUM

The word "Sodium" is disclaimed apart from the mark as shown. Owner of Reg. No. 378,610.
For Sedative Preparations in Tablet, Elixir, and Capsule Form, for the Relief of Hypertension, Neuroses, Anxiety States, and Menopausal Symptoms.
First use in June 1939.

SN 7,363. Olin Mathieson Chemical Corporation, New York, N. Y. Filed Apr. 30, 1956.

## AMBONESTYL

For Preparations for the Treatment of Cardiac Arrhythmias.
First use Dec. 9, 1955.

SN 7,973. First Texas Chemical Manufacturing Company, Dallas, Tex. Filed May 9, 1956.

## NEOVIS

For Vitamin Preparation.
First use Oct. 12, 1942.

SN 8,092. Organon Inc., Orange, N. J. Filed May 10, 1956.

## DURABOLIN

For Medicinal Hormone Preparation.
First use Feb. 9, 1956.

SN 8,093. Organon Inc., Orange, N. J. Filed May 10, 1956.

## ALBARIN

For Medicinal Hormone Preparation.
First use Feb. 9, 1956.

SN 8,200. Schenley Laboratories, Inc., New York, N. Y. Filed May 14, 1956.

## DIFEN

For Antihistamines.
First use Apr. 17, 1956.

SN 8,282. Tablerock Laboratories, Inc., Greenville, S. C. Filed May 14, 1956.

## TACOSAL

For Preparation for the Treatment of Rheumatism and Arthritis.
First use May 4, 1956.

SN 8,351. Chas. Pfizer & Co., Inc., Brooklyn, N. Y. Filed May 15, 1956.

## BONADETTES

For Antihistaminic Preparation Useful in the Prevention and Treatment of Nausea, Vomiting, and Vertigo.
First use Apr. 10, 1956.

SN 8,352. Chas. Pfizer & Co., Inc., Brooklyn, N. Y. Filed May 15, 1956.

## BONAMETS

For Antihistaminic Preparation Useful in the Prevention and Treatment of Nausea, Vomiting, and Vertigo.
First use Apr. 10, 1956.

SN 8,412. Hiss Pharmacal Company, Inc., Utica, N. Y. Filed May 16, 1956.

## PENTETRATE UNICELLES

For Timed Disintegration Capsules of Penta-Erythritol Tetranitrate.
First use Mar. 2, 1956.

SN 8,436. Permicutan-Gesellschaft für Chemische, Pharmazeutische und Kosmetische Erzeugnisse m. b. H., Munich, Germany. Filed May 16, 1956.

## SALISTOPERM

Owner of German Reg. No. 625,263, dated Aug. 25, 1952.
For Medicines.

SN 8,466. Bristol Laboratories Inc., New York, N. Y. Filed May 17, 1956.

## P.R.N.

For Antacid.
First use June 6, 1955.

SN 8,849. Hubbard Milling Company, Mankato, Minn. Filed May 23, 1956. Sec. 2(f).

HUBBARD'S

Owner of Reg. Nos. 82,516, 621,407, and others.
For Vitamin, Mineral, and Protein Concentrates for Use as Feed Supplements for Livestock and Poultry.
First use Mar. 1, 1939.

### CLASS 19

### VEHICLES

SN 7,402. Visors, Inc., Saginaw, Mich. Filed Apr. 30, 1956.

## SUNBAN

For Automobile Visors.
First use Apr. 20, 1956.

### CLASS 20

### LINOLEUM AND OILED CLOTH

SN 683,353. Richard L. Capell, d. b. a. Jata-Mat Company, San Francisco, Calif. Filed Mar. 14, 1955.

## JATA-MAT

For Coverings of the Type Which Are Provided With a Burlap Surfacing and a Paper or Similar Backing and Which Are Adapted To Be Pasted on a Wall or Otherwise Secured Thereto To Cover the Wall.
First use on or about June 1953.
